YOUNG chicks of the Polish, Dorking, or Hamburg breeds, are tender when very young and not as easily raised as some other kinds.

A CROSS of Wyandotte or Plymouth Rock on Brahma or Cochin hens makes the best broilers for market.

THE hens that begin to moult early will give you eggs in Winter. Do not sell the early moulting hens.

APRIL is the best month for obtaining high prices for poultry, and in December the prices are the lowest, but the case is reversed for the prices of eggs.

DRY, sandy soil that will not produce a blade of grass, is the best for poultry in confinement.

ABOUT one-fourth Leghorn blood will make its influence felt. It hastens early maturity, but imparts too much comb for cold climates.

THE size of the yards is of but little consequence if they are kept clean and the hens are made to scratch and work.

FEATHER pulling is an acquired habit. If one of the hens becomes addicted to the vice, she will teach all the others. There is no cure for it. When the habit becomes general, sell off the flock and begin anew. It always results from idleness. Keep the hens busy.

TOP ventilation has done more to cause roup and colds than all other causes combined.

A SATURATED solution of boracic acid should always be on hand. For swelled head and eyes, applied with a soft sponge, it is one of the best remedies known. A teaspoonful poured down the throat, twice a day, is an excellent remedy for roup, while a mixture of equal parts of the powdered boracic acid and borax—a teaspoonful once a day, has been successful in cases of cholera.

WHEN little chicks become drowsy, droop, refuse to eat, and finally die, examine very closely for lice.

WHEN sitting hens become disgusted, and leave the nests, lice are somewhere in the poultry house, but more particularly in the nests.

BROKEN or rotten eggs always breed lice in myriads.

OVER 1,000 broilers were raised with a loss of only three per cent., this season, in a building 10 feet wide and 60 feet long, brooders being used for that purpose.

DAMPNESS is fatal to young chicks, not only in Winter, but even in July.

The Swineherd.

A DEFENCE OF POLAND-CHINAS.

IN looking over last year's RURALS the other day, I came across an article on large breeds of swine by Col. F. D. Curtis in the issue of September 26, 1885. A writer in the Cultivator had said that the Poland-Chinas were the best for crossing with the smaller breeds, as the sows are always kind, have large litters, and rear with less difficulty and loss than any other breed the writer had tried; while the Chester-White and Duroc-Jersey sows become cross and unmanageable after rearing one or two litters, when a good sow should be worth most to a breeder. The Colonel called this the most preposterous paragraph ever written. He said the writer must be a Poland-China crank; that no large breeds of hogs have smaller litters or raise a smaller per cent. of pigs than the Poland-China. He insisted that the best large breed to cross with the small breeds is the Duroc-Jersey, and that Duroc-Jerseys and Chester-whites average one-third more pigs born and raised. He claimed the Poland-China hogs to be the weakest of the large breeds in bone and muscle, owing to close in-breeding, and the universal system of crowding the pigs with corn from birth. He declared they are three-fourths Berkshire, and get all their good qualities from that breed. "Simple assertion," says the gallant Colonel, "will not give hogs stamina, or lots of pigs, or large udders; nor will fat."

If extravagance of statement is to be the criterion, I might with equal or more justice call the Colonel a crank—perhaps of the Duroc-Jersey variety—but from his writings, I know that he is a shrewd business man, and from occasional advertisements, I know he has Duroc-Jerseys for sale. I certainly don't think, therefore, the Colonel is a crank, for I can see a better reason than crankiness for his exaggeration of the merits of the Duroc-Jersey, and his belittlement of those of a rival breed. I have had a good deal of experience with Poland-Chinas and the other large breeds, and know therefore that the writer in the Cultivator was not a crank in his praise of the breed, as hundreds of others could honestly express the same opinions from actual experience. As a matter of fact, the Poland-Chinas do not have smaller litters, nor do they raise a smaller percentage of pigs than the other large breeds; on the contrary, they are very prolific and the best of mothers. I cannot see why the Colonel should wish to cross the Duroc-Jersey on the smaller breeds, unless he wishes thereby to make an improvement in the Duroc-Jersey, which he certainly can do. I value a hog for the quantity and quality of the hog in him, and if a small breed suited my purpose, I would have it; and if a large breed did so, as is actually the case, I would have it also; but in no case would I have the Duroc-Jersey.

I admit the Poland-Chinas cannot climb fences and root under hedges like the Duroc-Jersey, but they have bone and muscle enough to walk long distances to market, carrying a very salable and profitable load of tender, juicy flesh. A few years ago I saw one weighing 700 lbs walk 15 miles to market in one day, so that he couldn't well be lacking in bone and muscle. With regard to the alleged excessive "crowding," why should the breeders or feeders of one strain of swine crowd their pigs from birth more than do the feeders of others, unless it is because they have the merit of being able to stand crowding better than the others? You can't crowd a Duroc-Jersey; but if you wait until he is two or three years old, and until you have cribbed in him two or three crops of corn (I believe the Colonel prefers peas), then you will have him in all his glory.

If the Poland-China has derived three-fourths of its excellent qualities from the Berkshire, is not that an excellent source from which to draw good qualities? As yet the Duroc-Jerseys have drawn very few good qualities from any source; indeed, it is doubtful whether the breed has yet been fully established—whether its claimed characteristics are transmitted with anything like certainty within its own membership, much less when crossed with other breeds. It is well known that the more markedly the characteristics of any breed are impressed on the pure-bred offspring, the more notable are they in crosses with scrubs or other breeds; and the Colonel acknowledges that the Duroc-Jerseys "have been bred scarcely long enough in a direct line to have become thoroughly established in all respects." The longer and more firmly a breed has been established, the greater the certainty of its transmitting its characteristics to its progeny by another breed, and as all the small breeds have been established much longer and more firmly than the D—J., isn't it plain that while a cross with them would improve the progeny on the Duroc-Jersey side: it would not be likely to do so on the small breed side, except perhaps in the same way as a cross with a "rail-splitter" might be said to "improve" them by imparting to the progeny a coarser vigor, a faculty for disposing of more food to less advantage, and other undesirable qualities which years of skillful breeding have bred out of the most profitable breeds.

Now for a few facts: In 1884 four pure-bred Poland-China sows produced and raised for me, 72 hogs, and when fattened in the same year, the sows weighed at 22 months, 450 pounds apiece. In 1885 three sows, 10 months old, produced 21 pigs and raised all of them. My favorite old sow, Bessie, last year produced and raised 24 pigs. I have also a pure Poland-China sow that farrowed three times in 1885, and raised 36 pigs. My neighbor, Mr. G. Goodlive, owns two Poland China sows which farrowed in March 1885; and one raised 14, the other 11 pigs, though the little things came in an open lot during a severe snow storm, with no shelter—did this prove they lacked stamina? I also know a herd of 12 sows (pure P. C.) which last Spring raised 108 fine pigs; can Col. Curtis show a herd of 12 Duroc-Jerseys which raised one-third more—or 144? I consider the Colonel an honest man and will accept his word in the matter; my own statements I am ready to confirm on oath at any time. "Simple assertion will not give hogs stamina, or lots of pigs," so it's your turn, Colonel, to come forward with the proof.

St. Joseph Co., Mo. R. J. YOUNG.

Farm Economy.

COTTON SEED FOR FEEDING.

IN our experiments in feeding cotton seed for beef and milk, the results seem to show that boiled cotton seed gives better results than cotton seed meal or seed with hulls removed.

Cotton seed is rich in fats and albuminoids; theoretically it should be fed with poor hay, straw, or corn or sorghum silage, to make a well balanced ration. Practically, when fed with the above named foods, we have found that it will make an animal fatten as rapidly as with the best quality of hay and corn. It is worth about 10 cents per bushel on the plantation, and one bushel—33⅓ pounds—is equal to half a bushel of corn for producing fat. A 1,000 to 1,200-pound steer will eat about one-half bushel of seed per day, if the seed is boiled, or about two-thirds as much, when fed raw. In our test last Winter, the steers fed on cooked seed gained nearly twice as fast in weight as the steers fed on raw seed, the balance of the ration in each case consisting of silage and hay.

In speaking of the indigestibility of the hull of the cotton seed, writers are drawing on their imagination. The hulls never appear in the excrements like grains and sometimes particles of coarse straw or hay, and, so far as I can learn, there is not a particle of evidence to show that cotton-seed hulls are less digestible than common hay. The hulls are used for feeding cows in many of the Southern cities, in the place of hay, and when fed with grain or cotton-seed meal, give about the same results as hay and grain. The cotton seed may not make as good a quality of beef as corn, but our Southern butchers pay as much for the one as for the other. F. A. GULLEY.

Prof. of Agr'l, Miss. Agr'l College.

DRAIN HEAD FOR "SINK-HOLE."

ON many farms there are one or more of those peculiar depressions commonly known as "sink-holes." They have no surface outlet, and the water from snow and rain that runs or falls into them, remains until evaporated by the sun and wind. The soil in them is invariably deep and rich, but is unavailable for any purpose except during very dry seasons. To drain them by cutting and maintaining a deep, open ditch, which is often done, is frequently to ruin almost as much good land as is contained in their area. The best, in fact the only practicable, method of draining them is to run tile drains through the high surrounding ground to the nearest natural outlet. In most instances where this has been done, a shallow well is sunk in the lowest part of the depression for the water to run into. It is walled with brick or stone, and the head of the drain opens into it. This well is only the less of two evils, as it must be guarded by a fence and cleaned out every year. A far better plan is to widen about four feet of the ditch to 2½ feet, lay the tile in, then fill this part of the excavation with coal ashes, as shown at Fig. 241. Cover the tile 12 to 15 inches deep with the coarsest hard cinders, then fill up, rounding with the coarsest of sifted ashes, tamping them firmly down as they are put in. Water will readily enter the drain through these ashes without carrying in any soil, while they present no obstacle to the passage of farming implements. Whenever they become clogged, which they probably will in five or six years, they should be removed. FRED. GRUNDY.

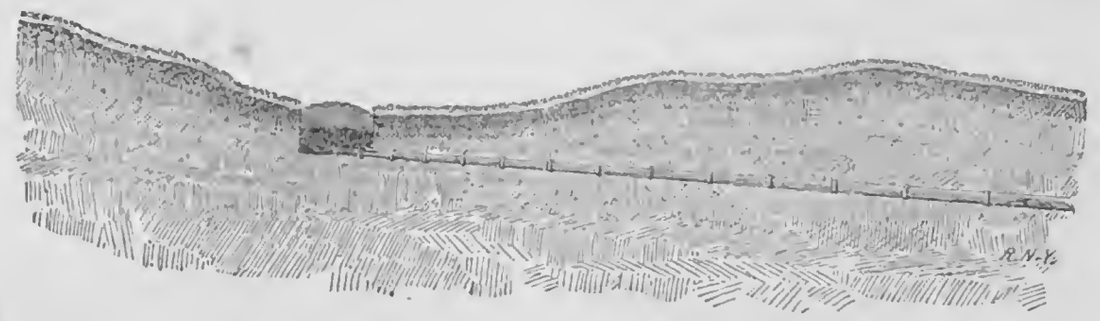

Fig. 241.

Christian Co., Ills.

A LAND ROLLER.

MR. W. S. WAITE, of Bedford Co., Tenn., is not well pleased with the roller described in the RURAL of April 3. He thinks it is clumsy, difficult to take down for transportation, and that the section behind is too light to mash hard clods or smooth uneven ground. The roller shown at Fig. 240 plea es him much better. The logs, or sections, are cut three feet long. A hole of the desired size is bored through the blocks in the center, and each end is morticed out to fit a 4½-inch square boxing. Both

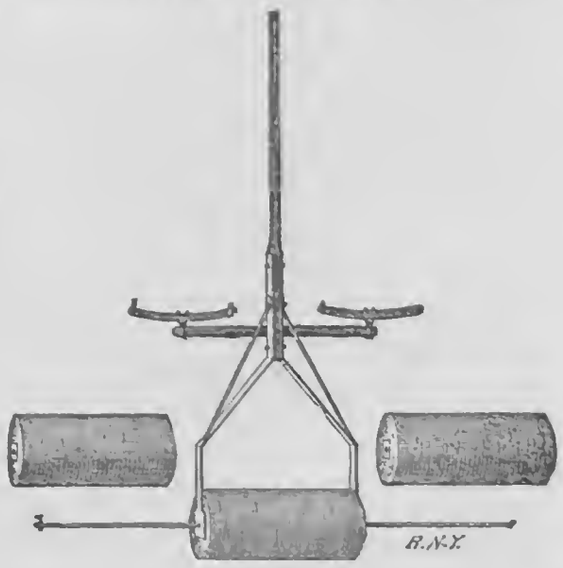

Fig. 240.

ends of the middle and the inside end of the outer sections are made concave. A tongue is used as for a wagon. The bars which hold the middle section are of 3½ inch by one-half inch iron, and fastened to the tongue by three bolts. Two braces of lighter iron are welded at the corners, as shown in the illustration, and bolted to the tongue. An iron plate, six inches wide, is welded to the ends of the bars over the ends of the middle section. To put the roller together, loosen the bolts on the tongue until the bars come far enough apart to cover the ends of the middle section. Then tighten the bolts well, put the pieces in exact line, and push the rod through, and fasten it with the key at the end. There should be a washer at each end of the rod. The rod should be two inches thick. Keep the boxing well oiled for light draft.

Floricultural.

NOTES ON NEW ROSES.

JAMES TAPLIN.

I AM afraid these notes will not be interesting, as they refer specially to varieties good for trade purposes; but yet these are in reality the best and most useful for the amateur to grow—that is, if he has the proper conditions for growing them.

HER MAJESTY, the latest novelty, is supposed to be a hardy rose. It is a very strong grower, and has a very large flower; but it is too new for me to give an opinion on its hardiness. Its appearance is much like that of the Baroness Rothschild; but we do not know yet whether it will flower as freely, though, of course, it may do so. There is no doubt that this is one of the largest, if not the largest, of roses; but we can find pæonies as large, that is, if size is its only recommendation, for it is woefully deficient in odor.

WILLIAM FRANCIS BENNET is also a new variety, and when well grown, like some exhibited at the N. Y. Horticultural Society's Show, it is a grand rose. It is good under any circumstances. It was complained that the flowers were nearly single when expanded; but we find that from good, strong plants, the flowers are full and large, and the scent is also fine. Unfortunately, like all the high-colored roses, the color soon goes; but I believe this will be one of the best new roses. It has not yet been proved hardy. It may be, but although La France is such a splendid forcing rose, it does little good in the open ground, and the Bennet belongs to the same class.

AMERICAN BEAUTY is said to have originated from seed gathered in the garden of Bancroft, the historian, at Newport, R. I. When I saw his garden, it was after a heavy thunder shower, and that evening the beautiful green grass to be seen in so few places in the United States, with the roses all in full bloom, made a lovely sight. Some growers think this variety will be a useful Autumn rose out-of-doors. At any rate, it is a fine grower, and also a splendid bloomer, and the scent is delicious.

MERVEILLE DE LYON appears to be better than Mabel Morrison; but all that class, although fine when well grown under glass, do not appear satisfactory outside.

SUNSET had, I presume, a good sale and I have seen some very good flowers of it from various growers; but, like the Perle des Jardins, from which it sprang, it does not seem adapted to outside planting.

THE BRIDE will, I believe, be the best paying white rose in cultivation for in-door culture; but, like its parent, Catherine Mermet, I presume it will be of little use outside. This sport originated with me, and I at once saw the value of it, though I did not push its sale. The stock was sold to a good judge, and is meeting with great favor both here and in England.

Arboricultural.

RUSSIAN ARTEMISIA.

PROF. J. L. BUDD.

PLANTS of the above have been sent to a number of experimenters in the Northwest, and these parties have requested me to give in the RURAL a note on its probable uses and value.

It is probably the Artemisia Tobolskianum of Loudon, who says of it: "This plant has elegant foliage, consisting of finely divided leaves. It is a much more vigorous-growing variety and larger in all its parts than the species (A. Abrotanum).

It will grow to a hight of from four to five feet, with a spreading bushy top, in a single season from cuttings. Its ultimate hight does not exceed eight feet. In foliage, fragrance and medicinal properties, it is much like the Southernwood or "Old Man" of our gardens.

It can hardly be called beautiful, but single clumps of it on the lawn are interesting, especially in the far Northwest where trees and bushes that will live are not over-abundant in number.

In riding a year ago over the prairies of North Dakota, without seeing a bush or tree for hours, the thought occurred that the wild artemisia of the Russian steppes would relieve the monotony of expression.

In hedge form it would prove invaluable, on the start, to arrest wind sweep from walks, flower gardens, etc.

In hedge form on the outer and inner borders of tree windbreaks it will also prove valuable for arresting snow.

It will grow on dry knobs of West Dakota, where most other ligneous plants will fail.

Ames, Iowa.

THE COTTONWOOD FOR SHELTER AND SHADE.

GOOD specimens of the cottonwood are, indeed, beautiful; and yet there seems to be a sort of a prejudice against it here in the West—strange, too, for in my humble opinion there is nothing like it. To the new settler on the prairies there is no tree that can take its place. I have known it now for 20 years, and the more I know it, the better I like it. If we were going on a new farm to-day—that is, on a prairie farm—the first thing I would do would be to plant at least five acres of Yellow Cottonwoods on the north of the site selected for the buildings, or, if I were going on to a farm anywhere here in the West, that did not already possess a good grove north of the buildings, I should immediately take steps to get one there. I wish I could impress the importance of this upon every dweller on the prairies. If the reader hasn't a grove he should make a move towards getting one next Fall or Spring, for in addition to its beauty, comfort, and pleasure, there is money in it—"big money," too. Don't set out half a dozen rows of trees and call them a wind-break, for they are only a fraud as a wind-break. At least four or five acres are wanted, and then the protection thus secured will do you and your stock some good.

Let nobody let some oily-tongued agent inveigle him into planting Russian Mulberries; for they are the biggest fraud of all; but let the intending planter get Yellow Cottonwoods for the first four or five acres; then if he chooses to plant more, let him plant black walnuts or ash. I recommend the cottonwood as the first, only because it is so easily procured and so early forms a protection, and a few about the house will soon form a grateful shade. The cottonwoods can be removed—or at least most of them—when one has had time to grow more desirable trees. One objection to the cottonwood as a shade tree is the annoyance from its millions of downy-coated seeds. These can be avoided by raising trees from cuttings, taking these from male trees which bear no seed. When we first came on the homestead, the old settlers told us that if we planted cottonwood we would soon have the whole farm seeded down; but this was a mistake. The seed seldom or never germinates except on sand-bars along the streams and on prairie that has been newly broken.

Evergreen Homestead. D. T. GAUTT.

SPREADING TREES.

ON page 238 of the RURAL, C. W. A. makes inquiries concerning upright pear trees. Let him use the arrangement shown at Fig. 239, and he will be well pleased with the result. By means of the little wooden brace shown in the picture, the trees can be easily changed as desired. These braces can be made of any free-splitting wood, from three-fourths to one-inch-and-a-quarter wide, of the length required, and thick enough not to bend. I have changed upright, thrifty-growing trees in this way very easily. It might not pay on a large scale, but for a few trees it would be desirable. N. CODY.

Tuscola Co., Mich.

Miscellaneous.

CORRESPONDENTS' VIEWS.

A FEW years ago I had a large quantity of buckwheat straw. I told my man to use it for bedding the hogs. He said it would poison them and give them some skin disease; but I used it all the same. I mowed three or four loads away in the hog-pen, and then let the hogs in. In the Spring I had several loads of fine manure and as nice a lot of hogs as I ever saw. It pays to bed hogs with a load of straw and not expect them to live on a few straws laid on a hard plank. Stingy bedding, in this country, will make a stingy-looking porker every time. C. W. F.

Charlotte, Vt.

THERE is no sure cure for a kicking cow. I would never keep one unless she was extra-good, and could give milk enough to pay for the extra work of handling her. The best cow I ever had would kick like a horse, with both feet. I put a ring in the post back of her, large enough to hold a good-sized strap. The strap could be buckled round her foot, and then pass up through the ring. At the first sign of a kick, I would get up and pass the strap through the ring, and pull on it till her foot came off the ground. Then she could only kick against the air, for the strap held her foot up. She never tried but once to kick with the other foot while one foot was tied up, and then she landed flat on her side. She got so that the strap, tied about her foot would keep her quiet. The foot had to be pulled up about once a month. The way some cows are treated, they would be fools if they didn't kick. I can take the mildest cow in this county and turn her into a kicker in six months. It looks sometimes as though a calf from a kicking cow would kick just like its mother. Too many cows have not much of anything but tricks to hand down to their calves.

Orange Co., N. Y. J. A. O.

I THINK the grade Percheron comes very near to the ideal farm horse for this country. The Clydesdales are good heavy-draught horses, but hardly active enough for a general purpose animal. If the Cleveland Bays are large enough to breed on our common mares, so as to produce a grade of proper size with their fine action and style, they will surely be the coming farm horse. PROF. S. JOHNSON.

Lansing, Mich.

THE yield of the Diehl-Mediterranean wheat, was, with me, 104 to one, and of the Thousand-fold Rye 121 to one. Like R. C. a late RURAL, I too think carp pay well. Last Summer I had in my pond one pair of carp three years old. From their family last Fall and this Spring, I have sold for stock purposes $44.10 worth, and still have as many more left in the pond. W. R. F.

Salisbury N. C.

NEW ZEALAND Grass is suggested for the South. I hope there is some man in the country with means, foresight and enthusiasm enough to act upon the suggestion. The man who can succeed in introducing a grass to take the place of the native grasses of the South, will be a great benefactor. I wish I could find such a grass for Texas. I landed here nine years ago, and at once asked, "What grass succeeds your prairie grass?" In all these years I have never received a satisfactory answer. One of the great misfortunes of Texas is her lack of good grasses. J. H.

Laurence., Texas.

FIRE-WOOD is the family peace-maker on many farms. A farmer who really desires to make the Summer but a long series of disputes with his wife and daughters, can easily accomplish his object by neglecting the wood pile. A. S.

IT is folly to plant potatoes on stiff, heavy, or clayey land, or on bottom land. The farmer who has no other kind of soil should leave potato culture alone, and raise corn on such land, and buy his potatoes. Potatoes grown on such land will be coarse and prongy, and have a ground taste. Three years of planting on such soil will transform good, smooth seed beyond recognition. E. A. P.

Chester Co., Pa.

WHEN my chicks come off the nest, I open their mouths and put one grain of black pepper down their throats, grease the top of the head well with lard and coal oil. They are the brightest chicks I ever saw. I have piles of broken dishes, pounded fine, placed about my chicken yard. The hens eat of it with relish. It takes the place of gravel. Such treatment keeps off cholera. There is no cure for the disease when it once becomes firmly established in a flock. Our potatoes were planted in trenches on the RURAL's plan. We did not have such a large crop, but we had more and better potatoes than our neighbors. The ground was not wet one inch in depth for three months. MRS. J. E. M.

Orange C. H., Va.

I KNOW of few ways in which my boys can be made more useful for a week in Spring than in pounding up the hard clumps of manure in the pastures. I make a lot of wooden mallets out of heavy wood. With a single blow from one of these, a hard manure clump can be scattered. This work pays as well as anything I know of in the manure line. The boys prefer it to spreading manure with a fork. The exercise of swinging the mallet is as good as base-ball to them. On a wet day the work can be done as the ground is firm and the hard clumps spread easily. M. D. E.

Queens Co., N. Y.

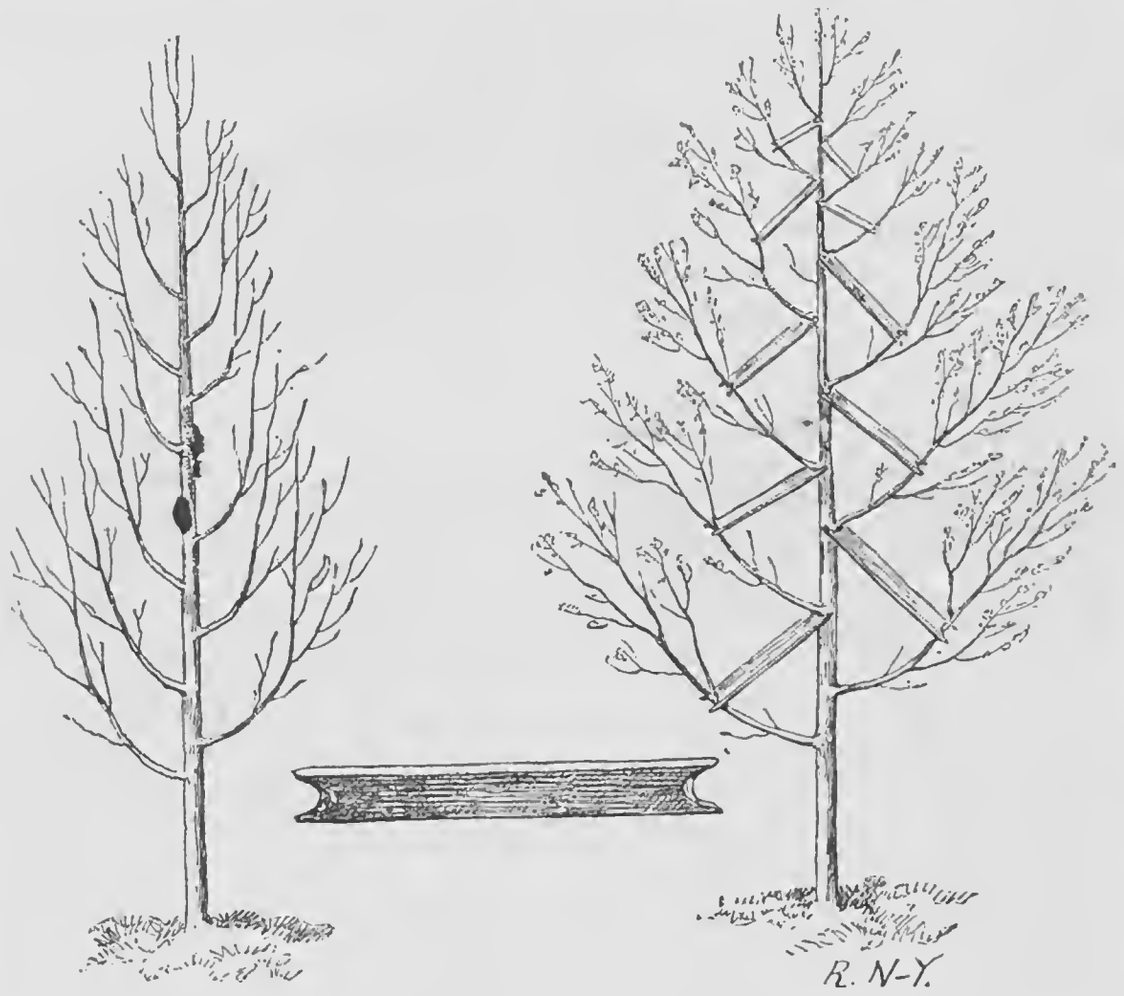

Fig. 239.

CATALOGUES, ETC., RECEIVED.

NUMEROUS FACTS ABOUT JERSEY CATTLE.—A very neat pamphlet of 30 pages, compiled by the official tester, under instructions from the Board of Directors of the A. J. J. C. It is intended for general distribution and can be obtained, we presume, from Mr. T. J. Hand, No. 1 Broadway, New York. As the pamphlet is designed to aid the general public in forming a just estimate of Jersey cattle, it would have been better to give the name of the official tester, as well as to have given the office of publication in a more prominent place. Members of the American Jersey Cattle Club do not need to be informed as to these points, but the general public does. As an instance of the need of such information, we may say that we have received several letters of late from owners and breeders of Jersey cattle, asking for the address of the A. J. C. C. As may be imagined, the pamphlet is given up to an exposition of the good qualities of Jersey cattle. As an argument in favor of the "little butter cow," it is a great success. We have never before seen so many facts and statistics concerning any breed of cattle crowded in a book of equal size. Those interested in any way in Jersey cattle should secure it. The superiority of the Jersey as a butter cow has long been admitted, and requires but little argument to support the claim. For milk dairies, Jerseys are rapidly winning a good reputation, both as to quality and quantity of milk. We do not think that Jerseymen will add much to the standing of their cattle by claiming much in the way of cheese or beef for their cows. Figures from Prof. Brown's tables are frequently quoted, but there is too much to be said on both sides as regards these figures to render them very authentic. We are told that the Herd Register of the A. J.

C. contained in the Spring of 1886 the names of 16,000 males and 37,000 females. It is estimated that of these registered animals, 9,000 males and 27,000 females are now alive. This gives one thoroughbred Jersey cow for every 2,200 people, and but one Jersey bull to every 1,300 dairy cows. Of course, this estimate does not include the grades which are found in great numbers in many localities. Mr. Edward Burnett, who writes of the Early History and Development of Jersey Cattle, thinks that the foundation of the breed was a cross on the large, red Normandy cow with the small, black Brittany many centuries ago. In Jersey it is evident that the Brittany predominated at first, and in Guernseys the reverse, as the Guernsey cow of to-day has the color, size and many characteristics of the famous Normandy cows. Owing to the difficulty of approach to those rock-bound islands, this original cross has been kept more or less intact, and time, coupled with good judgment, has formed a distinct breed of cattle. Space will not permit us to make further extracts from this valuable pamphlet. We heartily commend it to our readers

ROYCE REAPER AND DANSVILLE MOWER. Catalogue from Sweet, Faulkner & Co., Dansville, N. Y.—It is claimed for the Royce Reaper, among other things, that it has a less number of parts than any other reaper, and that it runs with the least possible power. These points are well illustrated and described in the catalogue. The Dansville Mower possesses simplicity, durability, and lightness of draught. It is a light, front-cut mower, drawn by a draught rod and chain attached to the double-tree. In both of these implements simplicity of movement and construction has been most sought after. The manufacturers very sensibly conclude that no farmer will buy a machine without first carefully examining all the various makes within reach. They invite such examination, having full confidence in the excellence of their implements.

SQUAWKIE HILL FARM.—Catalogue from F. S. Peer, Mt. Morris, N. Y.—Cleveland Bay and thoroughbred horses of fine quality are offered. The Cleveland Bay horse comes nearer the ideal "general-purpose" horse than any breed that has ever been brought into this country. There is a good profit to be made at breeding these beautiful animals. There is a good market for heavy draft horses, but a much better one for elegant coaching or carriage horses, and the Cleveland Bay seems admirably fitted to furnish the latter class. In fact, we cannot think of a more promising field for horsemen at present than the rearing of good grade Cleveland Bays. The animals at Squawkee Hill Farm are first-class. Send for the catalogue.

FOURTH ANNUAL REPORT of the Ohio Ag. Ex. Station, Ohio State University, Columbus, O.—This is by far the best report made by this station, and it is one of the most creditable reports we have ever looked over. A little more care might have been given to proof-reading, and the Report should have been issued months ago; but with these exceptions, every intelligent reader, but especially those who have been engaged in experimental work, will be struck with the great amount of hard work and patient, careful observation which the Report shows. It should be in the hands of all progressive farmers. Address the Director, W. R. Lazenby, as above.

MICHIGAN HORTICULTURAL SOCIETY.—Programme of the summer meeting to be held at Lansing, June 15 and 16, from C. W. Garfield, Grand Rapids.—This meeting promises to be very attractive. The programme is decidedly unique. We do not remember to have seen anything like it before. The aim is to exhaust a few popular subjects instead of trying to cover the whole range of horticulture. Professors Cook, Beal and Bailey, assisted by classes from the Agricultural College, will take charge of the evening sessions. All Michigan horticulturists should attend. To all visitors from other States we guarantee a hearty reception.

MISSOURI HORTICULTURE.—The summer meeting of the Missouri Horticultural Society will be held, so we are informed by the secretary, L. A. Goodman, at Louisiana, Mo., June 8 and 9. An excellent meeting is expected, and a glance at the well-arranged programme shows that the work of preparation is thorough. Free entertainment will be given all who attend. Premiums are to be awarded for best display of strawberries, cherries, currants, flowers, and vegetables. We are confident that horticulturists and, in fact, all who till the soil, will derive much profit and pleasure from this meeting.

PORTABLE POULTRY HOUSES.—New circular from the American Patent Portable House Co., Corona, Queens Co., N. Y.—These houses are growing in favor with the public. The small poultry houses are much admired. The greatest compliment that can be paid them is contained in the statement that the neighbors' chickens take possession of them, in the factory yard, before they are finished. Those purchasing houses are given special discounts on the price of the Standard Hexagonal Wire Netting. The circular will be mailed free.

AYRSHIRE CATTLE.—Catalogue of registered Ayrshires from the herd of the late Samuel Campbell, to be sold at public auction at New York Mills, Oneida Co., N. Y., June 23.—The list includes 83 cows and heifers and six bulls—all good animals. The Ayrshires have never been properly appreciated. They occupy a worthy place in farm economy. All who desire to secure good specimens of the breed should attend the sale.

THE GREAT AMERICAN TEA CO., 31 and 33 Vesey Street, New York.—Circular and price-list of teas and coffees. The prices of this thoroughly reliable house range, for coffees, from 15 to 30 cents, and for teas from 30 to 80 cents. All goods not satisfactory can be returned at the Company's expense both ways, and exchanged.

CUTTER FOR STRAWBERRY RUNNERS.

THE most profitable system of strawberry culture is the hill system. The greatest objection to it is the labor and trouble of keeping the runners off. I find a cutter made like that shown at Fig. 243, a very convenient arrange-

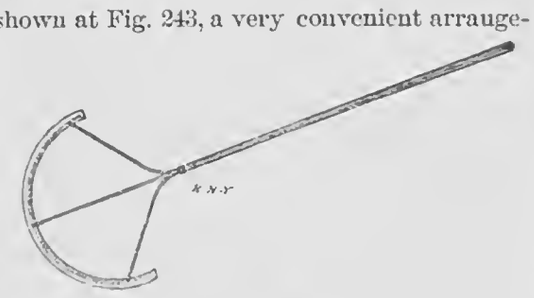

Fig. 243.

ment for that purpose: Take a thin plate of steel two to three inches broad and two feet long; sharpen one edge, bend it into a half circle, rivet three shanks to it—one near each end and one in the middle—bring these altogether with a gentle curve in the center and weld them into a single solid shank. Then put a handle on this, as on an ordinary hoe, and your instrument is completed. Two licks with this will cut the runners completely around a hill of plants, and no stooping is required Any blacksmith can make one.

Fremont Co., Col. L. J. TEMPLIN.

What Others Say.

EXPERIMENTS IN SILOS AND SILAGE.—The Weekly Press says that, as a rule, corn for ensilage is planted so closely that ears in quantity worth preserving are not produced. But for two seasons past some farmers have planted corn as usual, and when the ears began to glaze they have gone through the field, picked them off and thrown them on the ground to ripen in the husk. Immediately after, while the stalks were yet green, they were cut and pitted. It is claimed that the grain ripened perfectly, while the stalks made silage of the best quality. It should be added that it is not now considered necessary to retain all the moisture of the stalks. Many farmers cut over their entire field, allowing the stalks to lie on the ground and cure meanwhile if the weather is good and some even stand the stalks up in shock before beginning to fill the silo. The stalks wilt but do not ferment and they are lighter to handle without losing any of their nutritive value. This practice does not make a large force necessary, and the hurry and drive of the old system are escaped. Slow filling, too, is recommended by the most experienced.

BREEDING FROM IMMATURE PARENTS.—The above journal, commenting upon what has been written upon this subject, says that it is often said that there must be a loss of stamina in farm stock when animals are bred so young. It is argued that the offspring of animals yet growing and not having attained their full strength must partake of the immature quality of their parents and lack endurance and constitutional vigor. But there are no facts to prove that the offspring of two-year-old heifers are at all inferior to the offspring of fully developed cows. It is the aim of poultrymen to have hens lay at as early an age as possible, and has it been demonstrated that chicks from pullets are more feeble or subject to disease than those from the toughest of hens? It is argued that diseases of swine are more prevalent on account of early breeding. But where is the proof? Are there any tabled statistics from which comparison can be made? It is garned, too, that horses lack bottom from the same cause. But if one was asked to name the toughest piece of horse-flesh ever foaled, he would probably select Goldsmith Maid, who was hammered over every race-track in the country for years, and yet made her best time at 17, and kept killing off all competitors until she was 20, when she was withdrawn from the turf sound in wind and limb and without spot or blemish. But Goldsmith Maid's sire, Alexander's Abdallah, was an immature three-year-old when he got the Maid, and Hambletonian was a half-grown two-year-old when he got Alexander's Abdallah. Here was an immature sire and grandsire both, while the offspring was exceptionally sound and hardy. Certainly it is quite "natural" for animals to mate just as soon as they have the desire to do so, and in a state of nature animals would breed as soon as they were able. And we know no facts to prove that the offspring of young animals are in any way more feeble than the offspring of animals full grown, or in their prime or aged.

OUR Associate, Mr. J. S. Woodward, writing to the Philadelphia Press, holds that no man has a moral, nor should he have a legal, right to permit his orchard to be a breeding ground for canker worms, codling moths, etc., even if he is too stupid to see that it would be profitable to clear the land of trees, and use it for farming. He should be compelled to destroy the insects or to cut down the trees. Both Paris-green and London-purple are deadly poisons; but Mr. W. has used both for years, and has yet to see any ill effects to man or beast from their application. Of the two he prefers Paris-green. Although it costs a trifle more than the purple, it is of more uniform strength, and as one-fourth pound of pure green is sufficient for 40 gallons of water, its cost is a matter of little account. It should be kept well stirred and applied with a nozzle, giving a fine spray. The Field force pump and cyclone nozzle are the best he has seen, and they are both cheap. For leaf eaters, apply as soon as they make their appearance, driving the spray well through the trees. For codling moth, the proper time to make application is just before the apples get large enough to hang down or while the calyx end is still up. This enables the poison to lodge in the calyx, and as the eggs are uniformly laid here, the young brood meets certain death with its first meal. If the orchard is used for pasturage, it is well enough to keep sheep or cattle out for a short time or until after a shower.

HINTS FOR THE DAIRY.—At the late dairy show in Dublin, Mr. Gilbert Murray considered the Ayrshire cow as the most economical milk producer. She will thrive where many other breeds would starve. Grade Shorthorns are the favorite dairy cows in England, being deep milkers and easily fattened when discarded from the dairy. No hay was considered equal to that from well saved Rye Grass, cut just before the flowering stage. Overheated hay is bad for dairy cows. Where the hay is saved in stacks, the best way to prevent this over-heating is to place layers of straw at intervals in the stack. The climate of Ireland being moist, hay barns were recommended. A mixture of wheat, bean or pea meal with a small quantity of linseed was considered the best food both for rearing young stock and producing first-class milk. The growing of flax was recommended in connection with dairy farming. The disposal of skim-milk was considered a chief difficulty in Irish dairying. Specimens of dried skim-milk were exhibited which could be manufactured at a trifling cost. It promises to be largely used in the future both for culinary purposes and for stock rearing. It will keep for an indefinite period. It is perfectly soluble in hot water.

MULTUM IN PARVO.

COL. CURTIS says, in Our Country Home, that "the books are a little mixed on the Poas." The Colonel says that "the common idea is that Poa pratensis is the botanical name of the famous Kentucky Blue Grass." We guess there is no doubt about it. "And when Poa grows in the older States, it dwindles down to Poa compressa." That is a piece of news to the R. N.-Y. "June Grass," he says, "is little Blue Grass which grows everywhere in New York and New England, and this is Poa compressa natural to roadsides and waste places, which furnishes the first bite where there is no Orchard Grass." June Grass is certainly Kentucky Blue Grass. Poa compressa or the grass to which the name "Blue" properly belongs is distinct from Poa pratensis in many ways, notably in its flattened culm and in blooming a month later. Just for the once, we fancy the Colonel himself is "a little mixed."

IN case of injury to cow's teats, Waldo F. Brown uses a silver milking tube which costs 75 cents. He prefers these to 25-cent tubes, which are liable to rust. So he tells the readers of the Press.

REMEMBER that cabbages may be raised by sowing the seeds where they are to grow just as well as sowing in a bed and transplanting. Sow thick and thin out.

FULL feed from the beginning if stock-raising is to be profitable. It is said that it is well to add sulphur to salt with the hay in the mow. It keeps it sweet.

WE are inclined to think that pyrethrum powder, or Buhach, as the California article is called, is the very best remedy for the cabbage worm. Use the powder dry, blowing it on the plants through a bellows, or with water, a tablespoonful to a gallon, the powder first wetted with alcohol.

MORE is wasted in this country than would keep some of the European nations, says Editor Libby.

TAKE one heaping spoonful of white powdered hellebore and put it in a pint of hot water. In five minutes stir it and pour it into a pailful of cold water. Syringe the currant and gooseberry bushes with this to kill the currant worm.

BOOK AGENT: Now then, here, Maria Jane, is Bunyan's Progress. Maria Jane: No, sar; I'se got two bunions already, and dey's never been no help to dis yer Pilgrim's Progress.

MR. E. C. PARNELL, in Country Home, tells in a few words the entire story of how to plant watermelon seeds. The proper preparation of the ground is a matter of importance, and should be done early in Spring, so that it will be ready when wanted. The ground should be plowed thoroughly and deeply; then harrowed thoroughly so as to level it nicely, when it should be marked off into rows about six feet apart each way. At each intersection two good shovelfuls of well-decayed manure are placed, and carefully incorporated with the soil by means of the fork, at the same time forming a slight hill, in the center of which the seeds are to be placed.

HAVEN'T you ever noticed that the large farmer usually brags about the number of acres he raises, or the number of cows he keeps, and that the small, thorough farmer usually tells of how many bushels he raises to the acre, or of how much money he gets from each cow? There is a pleasure in trebling the crop of grass or potatoes. It is the joy of conquest with no harm done any one—no bloodshed. It is a pleasure to have your work so concentrated and in hand that you can avoid much of the worry of spread-out farming. Mr. T. B. Terry is credited with having written the above, though the paper is not mentioned.

PAY cash for everything; keep out of debt if you have to *borrow the money*, is the advice of "Life."

A WRITER in the Indiana Farmer speaks of curing some sick hogs by feeding them burnt corn-cobs. The cobs were burned in a heap, salt applied as the flame stopped, and a small quantity of corn thrown over the whole. Charcoal is one of the best known absorbents of foul gasses It is frequently given in human practice where the stomach is filled with sour gasses and undigested food. When given with salt or magnesia, it clears out the stomach and bowels, and allays the irritation of the intestines by removing the cause. Hogs need charcoal, and this method of supplying it appears as feasible as any.

IN Holland, the home of the Holstein, the famous black-and-white cows are bred for beef. At the last fat stock show held at Alkmaar, a six-year-old cow weighed 2,277½ pounds, but a fraction less than the great Hereford steer, Regulus at Chicago last year.

THE Agricultural Gazette says that the order of the day upon the farm just now is to live and not to practice what is commonly known as "improved agriculture." And yet, it occurs to us that many farmers must improve their methods, or fail.

THE Husbandman justly recommends oats as a good crop for the dairymen to raise. They can be cut while the straw is still green and the grain is turning gray—not yellow. At this stage oats are superior to hay for milk production.

THE Agricultural Gazette states that American horse breeders have taken the very cream of English horses out of the country. Not only has there been a lack of good stallions, but of brood mares as well. All the British breeds of horses, cattle or sheep appear to take on fresh vigor and size and reach their highest state of perfection at the hands of American breeders. England must soon look to America, not only for work horses but for breeding stock as well.

A WRITER in the National Live Stock Journal asks: How many stables are there that are properly lighted? Too many of them are gloomy dungeons, pervaded by a mysterious twilight, that might render vision clear to the open-eyed owl, but which requires several minutes for the adjustment of the smaller-apertured eye of man to enable it to see objects even in dim outline.

BUT you keep your horse in this stable! When you go in, you leave the door open, and

maybe you shove a board from a window in the rear of your horse. Why do you do this? For no other purpose than to enable you to see, even imperfectly, to do whatever you have to perform. But your horse is left, day after day, to stand in the dark and poke around the rack and manger for its feed, and you take no thought about the matter. Do you suppose its eye-sight is not strained by this exertion and the sudden transitions from darkness to light whenever you lead it out of the stable? You can depend upon it many a horse suffers from imperfect eye-sight because of this very thoughtlessness on the part of its owner.....

THEN, again, light is essential to health, continues the same writer. You can not dwell in a house or apartment where the sunlight never strikes and the full daylight never comes, without becoming depressed, gloomy, sour and sick This fact is beginning to be well recognized by many intelligent persons. The same effect in kind, if not in degree, is produced on the horse or other animal that constantly stands in the cold twilight of a never-sunlighted stable. You must have light, as well as air and food or you can not enjoy perfect health. Neither can your horse.....

AT the Elmira Farmers' Club, as stated in the Husbandman, it was remarked that by the use of cream separators the percentage of cream is increased; that is, more is obtained than by the ordinary process of setting the milk. It was stated, however, that the quality of butter made from separated cream is slightly inferior, and that the skim-milk makes very poor cheese.....

EXPERIMENTS have been made in England with a new fertilizer—basic cinders—the refuse of steel works. Analysis shows that it contains 14 per cent. of phosphoric acid and 41 per cent. of lime. Applied to heavy clay soil, the fertilizer gave excellent results. It was particularly valuable for root crops.....

SIR J. B. LAWES tells English farmers that the present depression in English agriculture will indeed be a calamity if it does not weed out some indolent habits, obsolete customs and unbusiness-like methods of farming. Hard times sharpen one's wits and work is reduced to the simplest methods.....

PROF. E. W. STEWART says that when the ensilage system shall have become perfected, corn, clovers, millet and many grasses will go into the silo together, or when necessary to preserve separately, will be fed together in Winter, and in this way milk can be made in Winter as well as upon grass in Summer.....

CORN, he says, is in the best condition for the silo when the ear reaches the dough state. The stalk and the ear in this condition contain all the nutriment possible in the corn crop. When the ear begins to glaze the stalk has become too woody for the best result.....

AN English writer notes the fact that cattle and sheep do not eat at random, but that they select grasses which they like and reject those which do not suit their taste. This explains why it is that worthless grasses run to seed while good grasses rarely seed except on meadow lands. The National Live Stock Journal holds that the above fact shows that the taste or instinct of the animal is a good guide to us in our selection of food for it to eat. It also shows why the best grasses often run out while the poorer take possession of the soil. If the rank, rejected growth could be mowed, and the more desirable growth kept up by sprinkling the right kind of seed over the pastures, a good gain could be made..

A WRITER in the Country Gentleman calls for justice for the pig. He very rightly says that the trouble with a dirty hog does not rest with the hog itself but with its master. The hog has both decency and manners if only permitted to practice them. A pen was divided into three compartments—a feeding room, a sleeping room, and a room for necessities. With little or no trouble the hogs were trained to use these rooms; where it was intended that they should sleep, a dry place was selected and filled with straw. A quantity of manure placed in the other room taught them the purpose for which it was designed. The article states that a cold and hungry hog can squeal off in a day what we have been at pains to put on it during a week of careful feeding.

IF the rum shop could be eliminated from the labor problem, says our respected friend the Western Rural, it would be easier of solution by a very large per cent. The money spent for liquor in this country is much greater than that spend for any article of consumption, and several times more than that spent for education.....

IT is true that the family may be suffering privation, but it is also true that it might, perhaps, be well provided for if a portion of the man's wages did not go for rum.....

WE know that if we could stop every still, and shut up every rumshop and plug up every rum barrel, every human being and the best interests of society would be better off.....

The hog must be fed less corn and more food that produces flesh, not fat.....

CLARE SEWELL READ, M. P., states in the London Live Stock Journal that English showyards have much to answer for the disrepute of pedigree stock. They have encouraged flesh to the detriment of milking and breeding properties of all their high-bred animals, and as a general result the females are shy breeders and poor milkers, and so farmers who have to get a living by selling store stock and dairy produce do not breed from them. To the comparatively few who sell only pedigree stock the case may be different.....

A WRITER in the London Live Stock Journal says he thinks for butchers' purposes there is nothing can beat a cross between a polled Angus bull and Short-horn cow They make good weights, and for early maturity and lightness of offal they are second to none. They are also very good dairy cows. He deems the polled Angus bull the most impressive sire of the day... .....

WHEN is the precise period that a pullet begins to be a hen; a pig a hog; a heifer a cow?.

THERE is in Ireland, says the London Live Stock Journal, a strong preference for the Booth strains of Short horns—heavy-fleshed animals, strong in the horn, and masculine in character. As a rule, they are moderate milkers, an important point in these depressed times.....

Everywhere.

TRANSCONTINENTAL LETTERS.—LI.

MARY WAGER-FISHER.

Olympia, capital of Washington Territory; a profitable and artistic dooryard; on the road to Portland; a dry season.

IT so happened in the course of our journeying in Washington Territory, that the very last place which I visited was its capital city, Olympia, situated at the head of Puget Sound. Aside from being the seat of legislation, this little town of 2,000 inhabitants has long been famous on this coast for the charm of its social life, the refinement and intelligence of its people, its tasteful homes, and "New England appearance." A lady once said to me: "In Olympia, everybody has a door yard full of fruits and flowers, and keeps a Jersey cow. It is the prettiest and most hospitable town in the Territory." So it was with a mind fully charged with pleasant prejudices that we boarded the steamer "Messenger," which plies between Seattle and Olympia, and after a charming sail of about eight hours, under a cloudless sky, we reached our destination. The town lies on a gentle eminence, which has a gradual slope to the water, and the hills and bluffs, which give great ruggedness to the site of most Puget Sound "cities," have here retreated far enough inland, and are sufficiently modified in character to leave to Olympia a distinctive location. The town would undoubtedly have acquired commercial importance, if its harbor, at low tide, had been capable of receiving sea-going vessels. As the capital, it is so far from being a central point in the Territory, that its chief chance of retaining this distinguishing privilege lies in the probable disagreement that will prevent any other town from being accepted as the capital, because of the rivalry between Eastern and Western Washington, which might harmonize their differences by having two capitals, as had Rhode Island, some years ago.

Captain P——, who owns and commands the "Messenger," and has a very picturesque home in Olympia, told me that off his home lot, consisting of less than a quarter of an acre, he had cut the past season a ton of hay, sent to market 40 boxes of apples from the trees, while from the garden his family had had an abundance of strawberries, raspberries, and blackberries, with other garden produce, and that he had given to his little son the privilege of selling all the cherries not desired for the use of the family and friends, and the little fellow said he got $20 for what he had sold, and had the money in bank. I thought it a profitable as well as an artistic door-yard, and from it I had, on October 15, a bouquet of exquisite roses, mignonette, sweet alyssum, carnations, abutilous, and many sweet-scented things.

The RURAL has a subscriber at Olympia, and to him and his hospitable family we owed much of the pleasure we enjoyed in our visit. During the hour and a half we were driven about the town and its environs, we had abundant opportunity to note the fruited gardens and the horses as well as "Jersey cows" nipping the luxurious pasture. We saw no pretentious dwellings, but the streets were beautiful with great maples planted years ago for shade trees—another distinct feature of Olympia, as Puget Sounders are, as a rule, afraid of shade trees—and cosy, tasteful, home-like dwellings peeping out through the foliage, for all the world like an Eastern village and delightful to Eastern eyes—none of the unkempt, crude and vulgar pomposity that so often characterizes the Western town, that has been inflated beyond its strength by a "boom." Our drive led us through a very picturesque suburb called Trimwater, which is Chinook for waterfall. These Trimwater Falls are in three series, which form a liberal distribution of water-power to various industries. During our drive, we saw two or three cemeteries, one Masonic and another "Odd Fellows," lying adjacent with a fence between, as a saving grace, one must suppose! As much as secret societies abound in the East, they abound still more here. There are all sorts of societies with high-sounding and mysterious names, but what they accomplish, beyond consuming enormously of time and money, is not very apparent. From Olympia, Mount Ranier shows its three peaks in distinct relief, and looking seaward, the blue range of the Olympic Mountains lay outlined against a background of yellow and vermillion—a wealth of color left in the sky by the setting sun. Our host drove us back to his home to "tea," of home cookery, which only a tired traveler knows how to appreciate fully, and where the laddie had a wild romp with the bright-eyed little people—Avis, Ida and Claude—a visit full of charm to us and long to be remembered.

At seven o'clock the next morning, we left Olympia by rail for Portland, Oregon. This railroad is a narrow-gauge affair, runs southeasterly through a level country for a distance of 16 miles to a town called Tenino, where it forms a junction with the Northern Pacific. The railroad fare is $1.25. For some distance out from Olympia, we saw comfortable and prosperous-looking country homes, imbedded in gardens of fruit trees, and considerable cleared and cultivated land. The woods had a park-like appearance, and, all in all, the ride was an interesting one. Considerable amusement was afforded the few passengers by a man in charge of a drove of spotted pigs. These black-and-white quadrupeds were completely demoralized by the passing train, and at once whisked about and began to run a race with it, while the drover, a red-headed man, threw off his hat and coat, and running at the top of his bent tried to head them off. What success he had we did not learn; but the last we saw of him he was still endeavoring to master the situation, with his arms beating the air. During a halt by the way, I saw a boy trudging along with a school book in his hand, and I asked him how far he had to walk to school. He said three miles and that there were 18 pupils in the school, which, if he spoke truly, was pretty fair evidence of the sparsness of the population in that locality.

It was about a year prior to this time that we traveled over this part of the Northern Pacific from Puget Sound to Kalama, a point on the Columbia River at which we took boat for Portland. But now the cars cross the river here on a huge transfer ferry, and as it was noon, there was half an hour for dinner in a fully fitted-up restaurant in the ferry boat, which occupied that length of time in the transit. It was the first time I had seen a restaurant under such circumstances, and, in the language of the West, I thought it quite a "scheme." We had a beautiful ride into Portland, the weather being of the finest description, and the snow peaks of Rainier, Adams, St. Helen's and Hood standing as if in a direct line in the range of the Cascade Mountains. St. Helen's rounded dome was almost devoid of snow, an unprecedented appearance, I was told, and last year when I saw it it was perfectly white. But every one seemed agreed that the past season had been one of extraordinary warmth and dryness on this Northwest coast. Indeed, whenever and wherever we went we had superb weather—altogether perfect—but everywhere we heard "old settlers" say, "Oh, this is exceptional weather," until we have come to think that all weather is "exceptional.

RURAL SPECIAL REPORTS.

California.

DRYTOWN, Amador Co., May 8.—We are just in the middle of haying, and the grass crop is the heaviest I have ever known here, and I have been in the State for 36 years. A trifle too wet for fine haying weather. Stock which three months ago was too thin to cast a shadow, is now rolling fat. Peaches and apricots very thin crops, as the continuous cold, wet weather during March and April caused the fruit to drop from the trees. Plums and apples will be heavy crops. D. B. R.

Canada.

FERNHILL, Ontario, May 20.—Times are very dull here, and prices are very low. Fall wheat will not be half a crop, as a great deal of it has been plowed up. Spring frosts were very heavy and did far more damage than at first supposed. Seeding is all done and everything looks well. The season is much in advance of what it was this time last year. Pears wintered well. We will have no peaches this year, and on May 8 there was a heavy frost which may injure plums and cherries. Apples will not be as plentiful as last year, while there are very few pears or grapes grown in this district. Plums and cherries have been a failure for some years past, but are coming in again. J. M. W.

Kansas.

SHERIDAN, Sheridan Co., May 9.—I have 40 acres of fall wheat and 10 acres of rye that look as fine as any grain I ever saw. I came out West only last year, and took up a Government homestead on timbered land, and though I have a wife and seven children, I raised last year plenty for my family to eat. I didn't expect to do any more as my land was all new. J. F.

Michigan.

ALBION, Calhoun Co., May 14.—The weather has been cool and pleasant this Spring. Wheat and grass are looking well. Oats are up, and last week fruit trees were in full bloom. S. G. E.

New York.

HORNELLSVILLE, Steuben Co., May 22.—The Spring opened here all of two weeks earlier than last year. Barley, wheat and oats all sown and the greater part of them up; and some very early sown barley is nearly ready to stalk. Grain never looked better in May, to my knowledge, than now, for the time sown. A large acreage of all kinds of spring grain sown. Winter wheat and rye looking fair, but badly winter-killed; very forward, and we look for an early harvest and a medium yield. Pasturing from two to three weeks ahead of last season and extra good; cattle turned out, generally, on or before the first of May. Timothy meadows looking well, and promising a heavy cut of hay of good quality. Clover and new-seeded meadows, in some sections, badly winter-killed and much turned under for spring crops; but what are left are early and looking well. Potatoes and corn are going into the ground from a week to 10 days earlier than common; some early planted fields are already showing well above ground. About average amount of corn planted; potatoes planted, planting and to be planted in large quantities. In fact, the farmers in this section are fast putting the potato crop at the head of their list. For general profitableness and certainty of yield, Burbanks, White Star and Snowflakes are the favorites for general culture in white varieties, and Blush, White Elephant and Adirondac for red. Fruit of all kinds has been in blossom for the last week, and blown the fullest for years; and at present no frost to do a particle of harm. Strawberries and other small fruits at least two weeks ahead of time and full of blossoms; and, if the weather continues as for the last four weeks, we shall have home-grown berries on our tables by the middle of June. Weather is and has been all that one could ask, and more than he could expect; just moist enough, and with nine-tenths of the heat, day and night, of July. Sheep being washed; but none as yet sheared in this vicinity. Beef and store cattle in good demand, but plenty; they are in extra good condition for the time of year. Dairy stock in fair demand at good prices; butter and cheese doing a little better than at same time last year. C. J. P.

Ohio.

YANKEE RIDGE, Coshocton Co., May 5.—Season very dry and backward till the middle of April, when warm weather brought everything forward with a rush, so that now vegetation is fully two weeks ahead of its condition at this time last year. A few farmers have begun to plant corn and others are getting ready as fast as they can. The ground has been pretty dry for plowing for some time, and farmers who make a habit of letting their stock run over their fields in wet weather have had a pretty tedious time in breaking it up. Early sown wheat looking well; but late-sowed was badly frozen out. Then drought and bad weather came on so it will be very thin on the ground. A good prospect for seedling peaches, but budded ones are a total failure. Outlook for apples never better at this season; indeed all kinds of fruit are making a fine start, except pears which are a failure. Very few berries are raised here; but what we have look fine. My Shaffer's and Doolittle came through the Winter in fine condition. Prices of all kinds of produce are very low: butter, 12 cents; eggs, 10 cents; bacon, 5 cents to 8 cents. Potatoes were worth 40 cents per bushel till about 10 days ago, when they fell to 30, and now the prospect is downward. Wheat 80 cents to 85 cents; corn, 40 cents; oats, 30 cents; other things in proportion. J. H. D.

Pennsylvania.

HEREFORD, Berks Co., May 20.—Crops are looking remarkably well. According to present appearances, the fruit crop will be the heaviest for the last ten years. Grain suffered somewhat last Winter, but has picked up very much, so that the stand now is excellent. But little corn has been planted as yet on account of the wet weather. Oats look promising.

W. H. S.

Vermont.

EAST POULTNEY, Rutland Co., May 18.—Farmers have about finished planting potatoes—area larger than last year. Some corn put in. Grass looking better than a year ago. Cows doing well. Horses selling high and in good demand. Eggs selling at 10 cents, and very abundant. Veal calves bring four cents a pound. Butter, 18 cents for dairy, and 25 cents for creamery. Hay from $14 to $18 per ton.

T. L. B.

Washington Territory.

SPANGLE, Spokane Co., May 7.—Our soil mostly rests on basalt rock which disintegrates and improves by cultivation, and we claim to excel in raising wheat, oats, barley, onions, peas and potatoes of extra fine quality and weight. It is not uncommon to raise potatoes here weighing from three to five pounds each without any cultivation whatever after planting. I inclose a sample of wheat which yielded 50 bushels per acre, machine measure. [It is known as the Seven-headed Wheat.—EDS.] The RURAL peas were splendid and the Flageolet beans did well.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

FERTILIZING SMALL FRUITS: GETTING RID OF SORREL.

G. C. M., Middleton, N. S.—Within three years, each acre of my 10-acre small fruit plantation, chiefly in strawberries, has received one ton of bone meal, half a ton of superphosphate and 500 pounds of muriate of potash; is this a good combination? The fertilizers are sown broadcast and harrowed in. Is a ton of bone meal too much for two crops of strawberries in connection with the other fertilizers? 2. How can I get rid of sorrel in my old strawberry beds, to be used again for strawberries next year?

ANS.—1. As we are ignorant of the nature of the soil, and therefore of the kind of plant food in which it is deficient, it is difficult to say whether the combination is or is not a wise one. Clay loams usually contain potash enough for ordinary plant growth; yet a moderate application of that fertilizer will prove beneficial on most strawberry beds. Bone meal and ashes are considered special fertilizers for the strawberry, and superphosphates have given good results; but the effects may vary on different soils. It was quite right to apply the fertilizers broadcast; but they might also be applied after planting by spreading them around the plants, not permitting them to touch the foliage, a hoe or cultivator being relied on to distribute it more thoroughly. There are other growers who would apply all the above fertilizers to an acre of strawberries, but we think this would be beyond the requirements of the plants. Garden crops, however, are generally fertilized by the best gardeners beyond the needs of the growing crops, because in the present condition of horticulture it is impossible to apply ingredients containing just the kind and amount of plant food required by the plants. Heavy applications of yard manure are often made to hasten the maturity of early products by the action of nitrogen, there being an excess of other fertilizing elements. We feed our plants much as an inexperienced man would feed his horses or cattle, not knowing positively their likes, dislikes or necessities. 2. Sorrel is a terrible pest among strawberries, equaled only by chickweed, red-root, June Grass, and Canada Thistles. Possibly sorrel will carry off the honors as the worst. As it appears to thrive best on cold, undrained soil, we recommend thorough drainage, which will be beneficial in any event. After draining we would give the soil a liberal dressing of air-slaked lime. There it nothing, however, that can be relied upon to clear the soil of foul weeds but the most thorough and persistent cultivation. In some soils it appears to be exceedingly difficult to obtain a mastery over these pests. The more fertile the soil, and the more desirable for plant growth, the more difficult the task of extermination.

BUTTER RATION FOR A COW; RAISING A CALF WITHOUT MILK.

W. C. H. Shrewsberry Mass.— 1. What is a good butter ration for a cow for Summer and Winter. How much and how often a day? 2. What is the best way to raise a calf with little or no milk?

ANS.—The best butter ration for a cow in Summer is all the grass she will eat. When a cow can have this food she wants nothing else and the yield from extra food in the form of meal is not in proportion to its cost, or, in other words, it won't pay. In Winter give good hay, not over-ripe. Clover is the best, green Red Top next, and last, Timothy. With all the hay she will eat, give a pail full of *warm* water morning, noon and night, or more if the cow is large. According to the size of the cow, give a feeding of meal in the following proportions, feeding morning and night, *after* watering and mixing the meal with cut hay, chaff, or roots—the last, the best:—two quarts each of linseed meal, corn, wheat bran, wheat middlings or ground oats. This makes eight quarts, and it should be mixed and divided into two meals of equal quantity. A peck of roots added will increase the return more than the analysis of the roots would indicate. Keep the cow always out of the cold. 2. Steep *sweet* and clover hay in water, and give the calf, after it is a week old, a quart of this "hay tea" with two quarts of milk, gradually increasing the hay tea and reducing the milk till the proportions are reversed—Up to one week old the calf must have milk. Stir into the food, after the little thing is a week old, a pinch of linseed meal, and gradually increase the amount up to a gill, by the time it is three weeks old. After this, add wheat middlings—a half gill at first, and gradually increase, keeping up the tea with a little milk. An egg, stirred into the liquid, will help. Too much meal will give it the scours. Some calves will eat more than others. When two weeks old, tempt it to eat grass, and give it all it will eat. Put oats in a dish with it, and let it eat all it will. Sprinkle a pinch of salt on the oats to induce it to eat them. The bowels must be watched to see the effect of the food, and changes should be made to suit the cow. Indigestion will produce scours, and so will a cold: over-feeding and exposure to storms or cold drafts are the usual causes in both cases.

Miscellaneous.

W. H. L., Templeton.—1. How long does the offer of eight Jewell strawberry plants to subscribers, for one subscription, hold good? 2. What's the color of the Rural Blush Potato? 3. Would the R. N.-Y. Pea make a good field pea? 4. Should red raspberries be cut back in the Spring, as recommended for black-caps? 5. Which is the more profitable way of growing strawberries—in hills with runners cut, or in matted rows?

ANS.—1. June 1st. 2. It is a little darker than the Beauty of Hebron, often with pink eyes. It changes in color. 3. No better than any of the "First Earlies" offered by seedsmen. 4. Perhaps we do not understand the question. The old canes may be cut out in the Fall. The new shoots should be pinched off when the canes are three feet high, and the laterals when a foot long. This secures a bushy habit, and stakes are less needed. 5. Matted rows. As soon as the plants have fruited we cultivate between the rows, keeping the soil free of weeds. After the first freeze in early Winter, we mulch with old farm manure, and do not again disturb the soil until after fruiting the next season.

W. S., Cook Co., Ill.—1. There is no easy method of getting rid of Canada Thistles. Make the land very rich with manure, and smother out the thistles with some rapid-growing crop, such as Red Clover. Plow under before they seed or cut them off, then cultivate often and thoroughly for the rest of the year till Winter. 2. A second growth of stumps can be most economically removed with the grubbing hoe. There will be no such thing as ease in the operation. 3. Read last two numbers of the RURAL for remedies for leaf lice. The surest remedy for the curculio is found in the jarring process frequently described in the RURAL. A sheet is spread under the trees and the tree is jarred, generally by striking it with a heavy beam, about which a thick carpet or blanket has been wound. This covering protects the bark of the tree and yet the blow dislodges the curculio. The insects are picked up from the sheet and destroyed. This process, though slow and wearisome, is the surest of any.

W. H. H., Harrisburg, Pa.—Peaches do not grow wild in any part of Wisconsin; nor are they successfully grown there under cultivation, except by a few amateurs who lay the trees down and bury them in Winter. Peaches cannot be budded upon thorns; nor can other stone fruits. The buds of apple and pear will "take" upon thorn, but such budding is not a preventive against the borers, as the thorn is as subject to the pests as other trees.

L. A. G., Vernon, N. Y.—We have used the kerosene emulsion sprayed upon the affected leaves with success as a remedy for lice in currant bushes. Tobacco water is also effective.

DISCUSSION.

SALT FOR STOCK.

A. W. W., Burnhams N. Y.—Several times I have noticed articles in the RURAL advising the frequent feeding of salt to stock, some saying that it should be constantly kept where they can get it whenever they wish.

I think the practice is injurious; that the taste for it is not natural, but is acquired like that for all other stimulants, which are known and acknowledged to be hurtful, such as alcohol, tobacco, opium, and others. The habit becomes so fixed by indulgence, that the appetite gets beyond control, and the victims ere long find themselves almost powerless to abstain from the use of such things, even when they know them to be exceedingly hurtful. A justly celebrated medical writer and practitioner speaking of salt, says: "This substance is used, even by those who have given attention to medical and physiological subjects, more from mere habit than from any good reason why. 'How unpalatable every thing is without it,' is the common expression. The facts in regard to the dietetic use of salt are these:—1 Salt is wholly innutritious; it affords no nourishment to any structure or substance of the human body. 2. It is utterly indigestible; it enters the body as a mineral substance; it is absorbed unchanged as a mineral substance, goes the rounds of the general circulation as an unassimilated mineral substance, and is finally eliminated from the body, through the kidneys, lungs, skin, etc., as an unassimilated mineral substance. 3. Its acrid quality is offensive to the vital sensibilities of the organs, always causing vital reaction or resistance; and this vital reaction constitutes the only stimulation ever provided by salt, and is, therefore, always attended with a commensurate degree of irritation and vital expenditure, and followed by a corresponding degree of indirect debility and atony; and consequently it always and inevitably tends to produce chronic debility, preternatural irritability and disease;—the stomach, intestines, absorbents, veins, heart, arteries, and all the other organs of the system, are always irritated, exhausted and debilitated by its presence. 4. It never, in any measure, promotes digestion, nor any of the assimilating functions of the system; on the contrary, it always retards these functions, and is unfavorable to all the vital changes."

One of the Rural writers says animals need salt, and they never can do well without it. My experience in cattle raising, though not as extensive as that of many others, is quite the contrary. The finest animals I ever raised never tasted salt. I do not by any means deny that very fine animals are raised which are fed with salt, but the superiority of such animals is not due to their having eaten salt. There are other reasons why they are so, in spite of salt eating.

Another sentence reads: "Sometimes men are obliged to go without salt for a long time, and they say it causes them the most awful suffering." Is it certain that this "awful suffering" is caused by the want of salt? If so, may it not be an additional evidence of the evils resulting from the bad habit of using stimulants? Deprive the inebriate, the smoker or the opium eater of his usual indulgences and he becomes testy, woeful and miserable, if not crazy. Are these indications of healthful habits? Dr. Graham says: "It is well known that sailors or others when confined for a considerable time to salted food, become afflicted with scurvy, always a very distressing and often a very fatal disease. We are informed by a physician from Paris that there is a certain order of convents in France where the inmates have been in the habit for centuries of abstaining wholly from salt, and also from animal food. This is done as a matter of penance, and it is notorious that such persons are remarkable for permanent health and long life. There are certain Indian tribes who use no salt, and who are yet strong and healthy—remarkably so; so that whatever may be said by chemical physiologists and others of the necessity for taking this stimulant into the stomach, and thus into the circulation, facts plainly prove that this supposed necessity is chimerical and does not exist. From careful and extended experience, I am strongly pressed to the conclusion that the use of salt is largely concerned in the production of cancers and other glandular diseases of the human system; that it exceedingly aggravates many chronic complaints, and that it increases the liability of the body to diseases of every kind; that it is directly conducive to scrofulous, pulmonary and skin diseases and disorders of the mucous membrane. In short, there is every reason to believe that it not only serves to predispose the body to every form of disease, but also seems to aggravate and perpetuate every species of disease induced, and that it seems to hasten on a premature old age, by rendering the solids dry and inelastic."

R. N.-Y.—It is doubtless true that an excessive use of salt will in time prove injurious, yet a moderate and systematic salting will not, in our opinion, do an animal harm. Wild animals instinctively seek salt springs and rocks to gratify the desire for salt. Some waters supply a sufficient quantity for health, so that there is no need of extra feeding. We do not think it would be possible for an animal to enjoy perfect health with the supply of salt entirely cut off. Whatever causes the suffering among those deprived of salt, it is beyond question that the suffering is real. The last campaign of Lopez, in Paraguay, or even the last year of our own war, evidence the fact that men miss salt and suffer when deprived of it. Salt is the only mineral substance used as an article of food by man and the higher orders of animals, and among all, wild or tame, there is a natural craving for it. This is not the case with regard to the other stimulants mentioned, and the fact must have great weight in favor of its use in the minds of sensible men. It is a stimulant tonic only in small quantities, acting as a purgative or emetic in larger ones. Experience abundantly proves that animals and many plants will not thrive without it; though, of course, too much acts as a poison. Whatever may be the conviction of an individual physician, however eminent, it is the nearly unanimous opinion of the medical profession that salt is a necessary stimulus in health, quickly passing into the blood and escaping mostly through the kidneys. The Bible makes frequent commendatory references to its use—all sacrifices offered in the Temple were seasoned with it; new-born children were rubbed with it, and, finally, it is mentioned as one of the things most necessary to life.

That Tired Feeling

The warm weather has a debilitating effect, especially upon those who are within doors most of the time. The peculiar, yet common, complaint known as "that tired feeling," is the result. This feeling can be entirely overcome by taking Hood's Sarsaparilla, which gives new life and strength to all the functions of the body.

"I could not sleep; had no appetite. I took Hood's Sarsaparilla and soon began to sleep soundly; could get up without that tired and languid feeling; and my appetite improved." R. A. SANFORD, Kent, Ohio.

Hood's Sarsaparilla

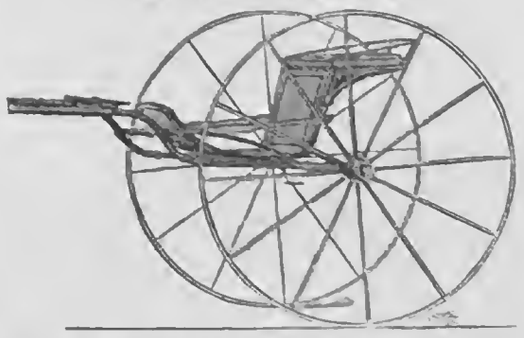
Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

MANY PERSONS suffering from liver Cough have imagined themselves victims of Consumption, but have been entirely restored to health by means of Warner's safe cure.

TO FARMERS. This simple invention is used in milking cows, particularly where there is any soreness. Made of solid silver, and sent by mail to any address on receipt of the price, 50 cts. Address The Milking Tube Co., 102 Friendship Street, Providence, R. I.

SAVE YOUR BUGGIES.



Educate the colts, and enjoy yourselves. Ask **C. S BEEBE, Racine, Wis.,** about different styles of Carts. He makes them.

Caused by a Fall.

RAYMOND, Miss., Aug. 13, 1885.—Four years ago, from a fall from my carriage, my kidneys and bladder became badly diseased. Physicians said my recovery was impossible. Took seven or eight bottles of Warner's safe cure, and it has saved my life.—ANNA CARLOP.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JUNE 5 1886.

PRESIDENT CLEVELAND and Miss Frances Folsom are to be married in the White House at Washington next Wednesday evening. Health, happiness, and all minor blessiugs attend the fortunate couple, and may their tribe increase!

SAVE seeds of your largest and best-flavored strawberries, blackberries, raspberries and currants, and sow them at once in drills of fine, rich soil. They will then sprout much sooner than if permitted to get dry. It is easy to protect such plants so they will winter in safety.

WE are very glad to know that the outlook for the Agricultural and Mechanical College of Mississipi is very encouraging. A majority of the students who have spent one, two or three years at this college have gone home to work on the farm. Its influence upon the adjacent country is shown, Prof. Gulley says, in the erection of 21 silos during the past 18 months by parties who have been watching the work of the college, while its plan of drainage, methods of planting and working crops and feeding cattle are being generally copied.

IN discussions of the labor question there appears to be a good deal of misconception as to the relative importance of the various pursuits and occupations in which the American people are engaged. According to the census of 1880, we had then a total population of 50,155,783. Of this number only 17,392,000 people of both sexes and all ages were engaged in gainful occupations in every kind of trade, business, profession or pursuit. Of this grand total people generally talk as if the manufacturing and mechanical industries employed the largest number of hands. This, however, was not so. Agriculture employed 7,670,000 people; 4,074,000 were employed in professional and personal services, and only 3,837,000 were engaged in manufactures, mechanics and mining, and the remaining 1,810,000 were employed in trade and transportation. The fact that people employed in manufacturing and mechanical pursuits are chiefly massed in our cities, and are combined in trade unions, and agitate a great deal in behalf of their own interests leads to the prevalent mistake that they form the largest division in the grand army of labor.

As is well known to our older readers, the R. N.-Y, has for years advocated the sowing of either Blue Grass, Red-top or both for lawns—rejecting the costly "lawn mixtures." Other writers have taken this matter up, and the Rural press in general is now alive to the importance of the subject. It is not economy to pay four dollars a bushel for lawn mixtures, made up chiefly of the two grasses mentioned, when either may be bought for less than half that sum. The pains-taking editor of the Weekly Press is in favor of sowing Timothy with them, so that a quicker effect may be prodnced. The Timothy, under the lawn-mower, will gradually die out giving way for the others. Early this Spring we sowed two small plots with Blue Grass and Red-top. They are now (May 27) covered as thickly as possible with grass and, but for a lighter color, could not be distinguished from the surrounding sward. Would Timothy have helped in any way?

TAXATION without representation is the lot of the farmers of this country almost as much as it was of the colonies when the grievance drove them into rebellion against the mother country. There are in the United States Senate 76 members, and in the House 332, a total of 408 in Congress. Of these, how many represent the most important industry in the nation, that which gives employment to nearly half the inhabitants of the country who follow any business whatever? The Congressional Directory shows that 10 members of Congress from all the Northern States call themselves farmers, while 15 Congressmen from the South call themselves planters. Of the Northern 10, Michigan contributes four, Wisconsin two, Rhode Island, New York, Missouri and Kansas, one each. But even of this meager number, all are not real farmers; for instance, the "farmer" from the Empire State is the Hon. Warner Miller, the great wood-pulp paper manufacturer. The great majority of Congressmen are lawyers; wouldn't it be better for the country if there were in its legislature fewer of these, and more of its agriculturists?

"OLEO" IN CONGRESS.

OLEOMARGARINE legislation has occupied more of the attention of the House of Representatives during the last four days than all other subjects combined. The bill taxing bogus butter, and placing its manufactnre under government supervision, has been eloquently, spiritedly, and learnedly supported, and bitterly assailed with invective, satire and ridicule. It will probably pass the House, as there appears to be a majority of about 50 in its favor. That Congress should place the manufacture and sale of bogus butter under government supervision is absolutely necessary to prevent the fraudulent sale of the stuff, and to insure that it shall be made of wholesome materials. It is a mistake to wage war against the product merely in behalf of the dairy interests of the country, however vast and important these are. It should also be opposed on behalf of consumers, upon the ground that the trade thrives only by fraud, and that nothing but fraud can keep it alive.

It is not a fight of one industry against another, but of butter producers and consumers against an atrocious fraud by which both are injured to fill with dishonest gains the pockets of a few wealthy manufacturers. The law providing for the honest manufacture and sale of the stuff must be general, so as to be applicable to every part of the country. It must therefore, be passed by the National legislature. The various States can legislate, if desirable, with regard to minor details. The great danger to the bill lurks in the Senate. That is the stronghold of corporate interests. The Senators only very indirectly representing the people, are less sensitive than the Representatives to the force of public opinion and the wishes of the people. Pressure should at once be brought to bear on them through the legislatures of the various States; for as it is by these they are elected, they cannot afford to disregard their wishes. The farmers of the country should, therefore, at once urge the members of their State legislatures to take action in this matter. There is not a moment to be lost. The bill will probably go up to the Senate early next week, and Senators should be at once enlightened with regard to the wishes of their respective States as to the necessity for protecting one of the largest interests in the country, as well as the public at large, from injury by gross fraud.

PRICE OF WHEAT.

REPORTS are general that stocks of wheat in farmers' hands are smaller than usual. If true, this is fortunate in view of the steady decline in prices. No. 2, the speculative grade, is selling at Chicago, the great receiving center, at less than 74 cents per bushel, and No. 3, at 67 cents. A good deal of the receipts will not grade higher than No. 3, the price of which averages from 7 to 8 cents below that of the speculative grade. On the basis of 74 cents per bushel for No. 2, the average price of all receipts would not be much over 67 cents, as a good deal doesn't grade at all. The cost of transportation and handling will average about 20 cents between the market and the country buyer, who must also make a profit, so that there isn't a vast sum left for the farmer. A similar showing can be made with regard to other grains, especially corn. It seems to us, prices ought to show an upward tendency. The visible supply of wheat has decreased from 58,432,389 bushels at the beginning of the year to 37,814,315 on May 22:—3,400,000 bushels less than a year ago. The "visible supply" now includes large quantities on the way to consumers by rail and water, and stocks at several collecting centers not counted in till less than two years ago. A year ago a large share of the enormous crop of 1884 was still in the hands of farmers; whereas but a comparatively small proportion of last year's meager crop is there now. Most of the available wheat must be included in the "visible supply," and that is steadily declining. Europe is buying freely at the present low quotations. In view of the foreign drain thus created, and the home consumption, it seems that prices should go up before the new crop can begin to come to market. In any case, there cannot be a heavy stock of old grain on hand to depress prices next harvest.

LABOR UNIONS AS REFORMERS.

IT is against the law to keep stores in New York open on Sunday; but in some of the streets, especially those in which Jews do a good deal of business, stores of all kinds are wide open from morning till night. The Central Labor Union, on complaint of the employés that they have to work 90 and sometimes 100 hours a week, has passed a resolution calling on all its members and friends to boycott all hat stores that keep open on Sunday, and has appointed a committee to see that the dealers should be duly prosecuted. This sort of boycotting seems hardly objectionable. It is the opinion of the most noted students of social life, that, apart from religious reasons, one day in seven should be a holiday. All who wish to give wage-earners a chance of rest and recreation, as well as all who seek a strict observance of the Sabbath, should wish success to this boycott. In this case organized labor acts as a reformer and an enforcer, not a breaker, of the law. The same agency is becoming a powerful aid to the temperance cause. The onslaught made on drink by Master Workman Powderly, in a late circular to the Knights of Labor, is likely to prove more effectual than the fervid addresses of scores of ordinary temperance agitators. A boycott against rum is the only boycott he favors, and this he urges every workman to establish on his own account for his individual benefit. Other prominent labor leaders are of the same mind, and in all the late labor strikes the excesses due to drink have been remarkably few. The labor leaders want their followers to be cool, fore-handed, and amenable to discipline; for thus they will have a better chance of winning what they seek. The Anarchists, on the other hand, favor rum and riot. They want their followers to be hot-headed, miserable and always poor, so that having no stake in the country, and being in a muddled, semi-crazy condition, they may be at all times ready for outrage and havoc.

AN INVITATION.

THE Rural hybrid rye-wheat plants show still further remarkable changes. We had hoped that it would be otherwise the present season, and that we might count upon such a constancy of characteristics that they might be propagated, named and in small quantities distributed over the country for general trial in a year or so. We had supposed that those plants which we have designated as "most resembling rye" had already assumed, more than the others, a fixed character, since from the beginning they have varied the least of all. It would appear, however, that they have *just begun* to vary, and that just when variation will cease, no one can tell. All of the seeds sown were from selected heads of tolerable uniformity with stems downy or hairy beneath the lower breasts. All were slightly bearded and of the same shape. Now we have stems perfectly smooth, partly hairy and densely so; heads that actually resemble *barley* more than either wheat or rye, while some are beardless. We shall not at this time dwell upon these strange variations. Our object in writing this note is to invite all botanists and all wheat specialists to visit the Rural Grounds between the present time and wheat harvest, that they may see for themselves, and study these hybrids that, in our humble estimation, present the widest differences and strangest developments known in cereal cultivation. No reference is made in the above remarks to our hybrids which are by parentage three-quarters rye and one-quarter wheat. We shall speak of them later.

Trains leave the foot of Chambers St. (Pavonia Ferry, N. Y. & N. J. R. R.) for River Edge, New Jersey, at 7:40, 8:40, and 9:50 A. M., and at 1, 4, and 5 P. M. The distance from the station to the Rural Grounds is one mile. If we can not in all cases give personal attention to our visitors, as we should be pleased to do, others will wait upon them.

WINTER WORK

FARMERS should plan work that will justify them in hiring laborers for the entire year. As it is, too many farm workmen live two lives. They work through the Summer and Fall on the farm, and then go to the cities where they spend the Winter as best they can. Boston and the smaller cities of New England provide shelter for thousands of these laborers through the Winter. Work for all of them is impossible in these times when hundreds of city laborers are seeking vainly for employment. Many of them find work shoveling snow, sweeping the streets or performing other work for the city, but such a life must be at best but a most precarious one, and the tendency is to drift into crime. It is estimated that 5,000 such farm laborers spent last Winter in Boston. Many of them find their way into the hands of the police, while all of them take back to the farm germs of disorder and vice to spread in the farmer's family. Doubtless some of these laborers prefer to spend their Winters in this way, yet there are others who would gladly stay on the farm for nominal wages and the sake of a home. The trouble is that farmers, under the present system of agriculture, arrange for so little winter work that they really need no help. Is it not possible for them, even in New England, to find profitable winter work that will enable them to keep a good proportion of this transient city population on the farm? The question has been answered satisfactorily by hundreds of good farmers who, by means of winter dairying and stock feeding, have been enabled to turn much of this wasting labor into cash. Their example is well worthy of imitation. The work of the year should be spread through the year instead of being crowded into seven months of hard labor with five months of comparative idleness. The work for the coming year is now in its infancy. Is it not possible to plan so that a little of the old order of things may be done away with? Try it.

BREVITIES.

GET the grape-bags ready.

FOR strawberries, probably there has never been the promise of a more abundant crop in many parts of the country than now.

IT was 26,649,319 acres of the public domain that were "taken up" in 1884, not 261,649,319, as the types made us say in the editorial on Land Legislation in last issue.

DUDLEY MILLER, of Oswego, writes us concerning our last cattle picture: "The RURAL deserves congratulations most hearty, for presenting its readers with the superb, life-like portrait of Lady Fulton, and will receive them in spirit, if not otherwise, from all lovers of fine stock who see this excellent and rare production."

REMEMBER that eggs are now worth 12 cents per dozen at wholesale in this market. Three months ago they were worth 25 cents. You are pushed with work now. Then you had plenty of time to sit about and talk. It takes very easy arithmetic to prove that six eggs then would bring as much cash as 12 eggs will bring now. Is there that difference in the cost of production? By watching the market reports you will find that there is almost as wide a margin in the prices of butter, beef, fruits, and other produce. The man who makes farming pay watches the markets. If he misses the best price one year, he is sure to be on hand the year following.

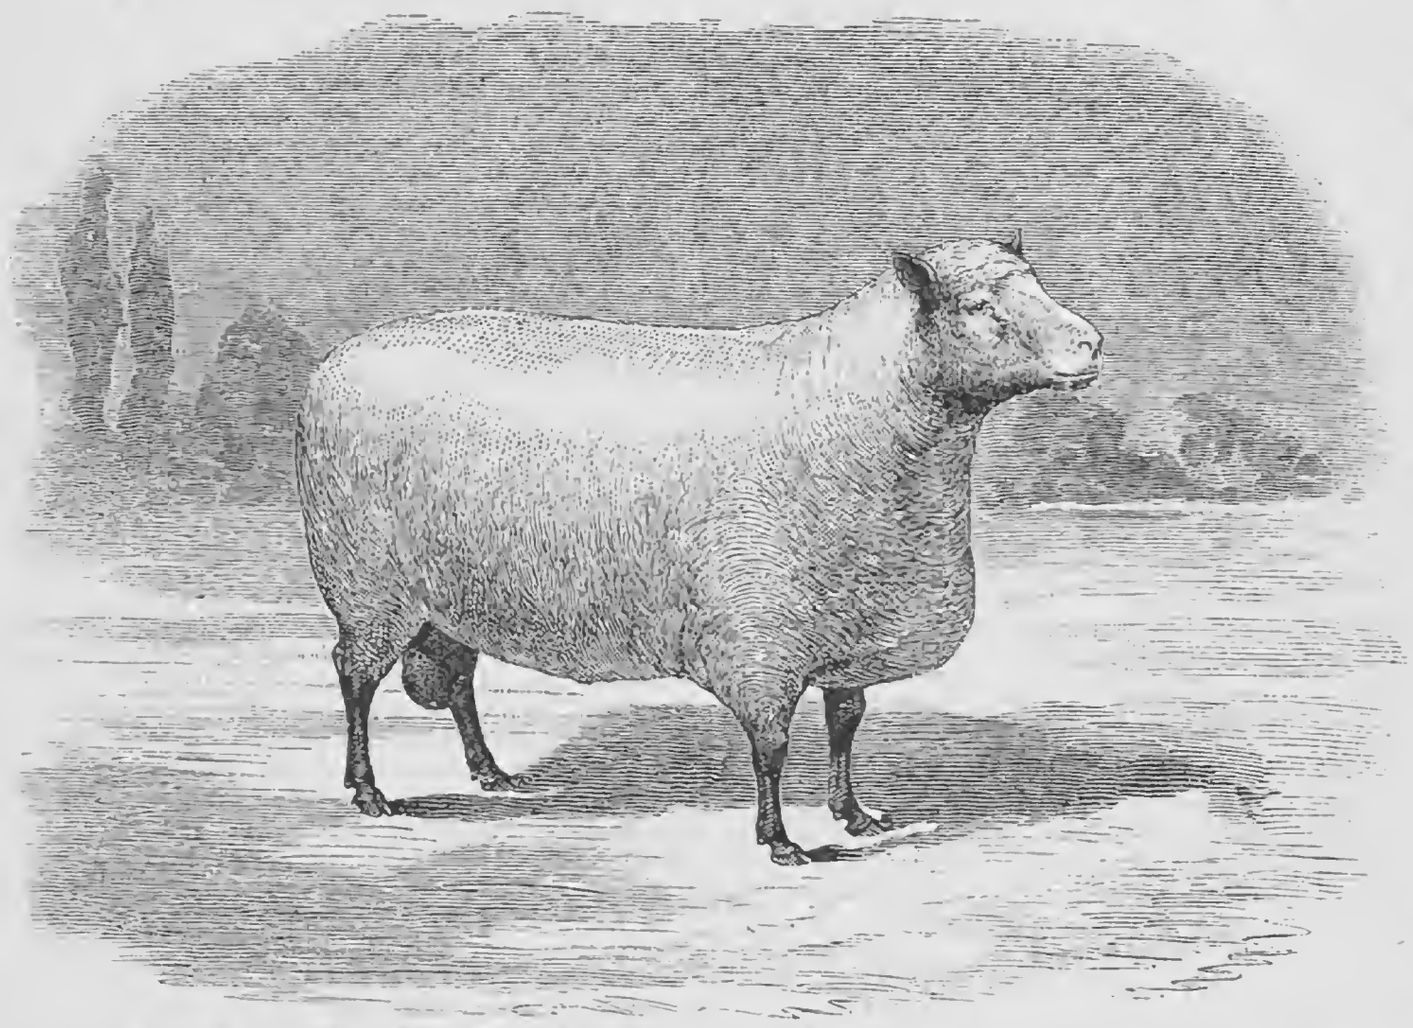
WE have just been looking over a copy of Moore's RURAL-NEW-YORKER, dated May 13, 1854, sent to us by a friend. It consisted then of but eight pages, the quality of the paper being about the same as that upon which the N. Y. Herald is printed to-day. The price was $2.00 per year. It was conducted by Mr. Moore assisted by Joseph Harris and several "corresponding editors." On the first page we find Crops for Soiling, a few words on Under-draining, the Grains and Grasses and an illustration of a Tumbler Cart. On the second page we have Charring Posts, Coal-tar, Drilling and Flat Culture, by L. B. Arnold; Shade and Fertilizer, Beans not an exhausting crop, and a column of Miscellany. The third page is devoted to horticulture; the fourth to educational topics; the fifth to poetry, short stories and to a ladies' department; the sixth to news items, the seventh to market, deaths and marriages and advertisements, and the last to poetry, short sketches, Youth's corner and advertisements. As we look over this journal of 32 years ago, which was then ranked as among the first of its class, and compare it with the present RURAL NEW-YORKER, we are impressed that Mr. Moore's favorite motto of "Progress and Improvement," has not been entirely lost sight of since.

THE lawn-mowers of to-day seem to be nearly perfection. They are light-running, durable and cut the grass evenly at the desired length. But an inexperienced person may in a year ruin a lawn-mower that with proper care would last five. The fatal mistake generally made is in screwing the revolving blades so low that they *touch* the horizontal blade. Of course, the machine cuts beautifully. The blades are sharpened by the contact, but wear away in a few days. Then the revolving blades are again lowered, and this is continued until they can be lowered no more and the machine needs repairs. Our experience is that when the essential parts of a mower need to be replaced, it is just as well to buy a new machine. The proper way is to see that the revolving blades of a new machine are so set that they can not be lowered *without* touching. Then it may be used one day at least in every week during the entire season without readjustment. The next year the knives may need sharpening, which is best done by lowering the revolving blades, or, properly speaking, raising the horizontal blade until they touch slightly, being careful that the pressure shall be equal in every part. Of course, machines should be oiled frequently and the bearings protected from sand and soil.

Sheep Husbandry.

SOUTHDOWN RAM CARDIFF.

THIS fine ram, shown at Fig. 244, is the property of the Prince of Wales. Cardiff has won numberless honors at stock exhibitions, and now heads the fine flock at the Royal Sheep Farm at Sandringham, where the supply of choice mutton for the Prince's tables is secured. The Prince of Wales may not be much of a farmer, but he ought to be a good judge of mutton; and the fact that South Downs have been kept so many years at Sandringham, speaks volumes in favor of this breed. We are told that the sole idea in breeding and selecting this flock has been to improve the quality of the mutton. The size and shape, and the wool product have hardly been considered. As a result of this selection, a flock has been formed which, in all probability, cannot be surpassed for the excellence of its mutton. Lord Beaconsticld once said that "our fathers lauded venison so highly for no better reason than because they never knew what good mutton really was." We may well believe that Sandringham mutton would quickly cure a taste for game. The sheep in this flock are fed on grass almost entirely. They run on the salt marshes during the Winter, except when the snow is on the ground. Every night they are brought back to the uplands and folded upon a field from which mangels have been drawn. A very few roots are fed, and at lambing time each ewe gets a small feed of oil-cake. Aside from this, the feed is entirely made up of grass and hay. The folding at night, done by means of portable fences, keeps the fields well enriched with comparatively little trouble. The earliest lambs come about the middle of February. The ewes appear to be very prolific, as 240 of them produced, last year, 360 lambs, and only six ewes were lost. The salt marsh is said to be very healthy for the sheep. There was hardly a case of lameness or stiff joints, while sore feet or rheumatism were unknown. The ewes with the most promising lambs are removed from the main flock and permitted to range by themselves. The others run in small bands in company with the young heifers or colts. It is said that these South Downs will ripen into the choicest of meat where the heavier breeds would starve; while the shepherds at Sandringham declare that they can keep five of these where three others would starve.



SOUTHDOWN RAM, CARDIFF. Fig. 244. Re-engraved from the London Live Stock Journal.

TICK PERSECUTION.

COL. F. D. CURTIS.

THERE were more sheep ticks last year than ever before. Where they all came from is a mystery. It is said, by old farmers, that when sheep run in the woods they will always get full of ticks. My sheep did run in the woods, and they were very ticky. This fact might prove the theory, but other people's sheep did not run in the woods, and they were also very ticky. I think condition has more to do with ticks and with the effects from the weather also. Thin stock always seem to invite parasites of all kinds. This is the case with cattle and the lice which infest them, and also with hogs; and why not with sheep? I think sheep were universally poorer the past Autumn and Winter than I ever saw them. The reason for this condition was the excessively cold and wet season, which is opposed to sheep doing well. The Spring, a year ago, was cold, wet and backward, and sheep carried their fleeces very late. This helped to lay a foundation for ticks, as it helped to make the sheep poor. The food sheep eat helps the tick business. If sheep are so fed as to be puny, they will have more ticks; these seem to delight in a poor condition and to want to be in at the death, to help finish up the poor creature they are preying upon.

The remedy for these depleting and destructive pests is care and sheep dip. The famous sheep breeders of Washington County, Pennsylvania, do not have any ticks on their sheep. They will not have any. So it seems resolution helps to keep clear of them. I have adopted the same idea, and have resolved to to try to carry it out. To do this involves early shearing, which has been done, and as soon as the weather will admit, each sheep and lamb will be dipped in Lawford's Sheep Dip, and again in the Autumn, and perhaps twice if necessary. The poor sheep should be put by themselves, and the best place for them is on some one else's farm, and if that cannot be done, in a pen by themselves. The amount of blood a good crop of sheep ticks will extract from a sheep or lamb is much more than a person imagines, and is always equal to the gain the infected and afflicted animal might make if the leeches were not at work. Unless the sheep are extra well fed they will run down rapidly, and they never gain anything, however well fed. The farmer should never neglect his sheep and allow these parasites to prey on them. They make the poor sheep mad with pain. I sheared a lot of sheep almost in midwinter to get the best of the ticks, and if it had not been done, the animals would have died, as they ran down in spite of food.

After sheep have been sheared the ticks go on the lambs, to return to the sheep when the wool gets out.

The dipping should take place in about two weeks after shearing, and care should be taken not to let the sheep get its nostrils under the liquid. Fools and boys should not dip sheep; it should be done by careful and humane men. The owner should be on hand to attend to the business the same as when sheep are washed. It is barbarism to set a lot of crazy boys and reckless men to do such work. The liquid may be put in a tub and the sheep dipped in and well saturated. It should then be lifted on a tight platform, slanting towards the tub, and allowed to drain off, the liquid running back into the tub. The waste of tobacco strips boiled does very well, if the decoction is just strong enough to kill the ticks and not to injure the sheep; but I prefer the sheep dip as safest and much less troublesome.

Educational.

EDUCATING BOYS FOR THE FARM.

A. DWINELL.

To educate his children the father must educate himself; drawbacks to academic and collegiate education; children shouldn't be so highly educated as to look down on their father or his calling; don't sink, that they may rise; parental influence must be maintained; pleasant early impressions form strong bonds of attachment to farm life; educate for work ahead; with good early training, later forms of education are matters of minor importance.

IF a farmer wishes to so educate his boys that they may become good and contented followers of his own calling, his first step should be to educate himself. In order that he may make successful farmers of them, he must himself have a just understanding of the possibilities of his vocation, and a genuine love for farm work. He must be wide-awake, enterprising, and always progressive; and, above all, he must be his sons' most efficient and best loved teacher. The farmer who neglects to improve his own mind and manners, who rigidly economizes and pinches in every possible way, who allows his home to fall into decay, become shabby, uninviting, and cheerless, that he may save money enough to send his boys away from home to the academy or to the agricultural college to learn the science of farming, makes a sad blunder. Instead of making contented and successful farmers of them, he is almost certain to educate them away from the farm, and, still worse, out of all sympathy and happy social relationship with himself. To give them a schooling which, under such circumstances, is quite likely to prove a real disadvantage to them, he relinquishes that parental influence over them which it is his highest duty to maintain and carefully exercise, and allows himself, his farm, and his home to degenerate into objects only too well calculated to deter aspiring young men from engaging in agricultural pursuits. This is penny wisdom and pound foolishness in a most exaggerated form.

I would not, by any means, be understood to say that the farmer who desires his boys to be farmers, should never send them to academy or college. A Liberal education is as great a benefit to a practical farmer as to any other business man. It is my object simply to emphasize the fact that it is never advisable for any man to undertake to lift his children on to a social plane above his own at the expense of his own comfort and advancement. It is, of course, natural and commendable for a father to wish his children to rise in the world, but it is the very essence of folly for him to make a tilting board of his life and seek to raise them into prominence by the dead weight of his own deterioration. The only safe course for him to pursue is that he should himself climb to the level he would have them occupy, and draw them up with him by the simple force of his love and example. If by their own efforts they finally reach hights which he cannot attain, well and good; but, be that as it may, his own struggle for self-improvement should on no account be given up except with life.

If a farmer is able to give his sons a collegiate education without pinching himself, it may be well for him to do so. Before deciding upon the step, however, he should take into careful consideration the influences to which a college student is at the present day exposed. Whatever may be said to the contrary, it is a fact that all our higher institutions of learning are pervaded by a certain atmosphere, the legitimate influence of which seems to be to create in the student who breathes it a distaste for agricultural pursuits. The sensitive and ambitious young college student, as a general rule, speedily becomes possessed of the notion that the labor of tilling the soil is low, unfavorable to intellectual growth, and a well-nigh insurmountable bar to social and political advancement. Unless the farmer, by virtue of his superior force of character, high intellectual attainments and social standing, has sufficient influence over his boys to neutralize this influence of the schools, if he is bent upon making farmers of them, he had better keep them away from even the agricultural college.

Very few college-bred men have become farmers; and of the few who have scarcely one can be found who passed his boyhood amidst the surroundings and influences of the ordinary farmer's home. This is not to be very much wondered at. Humiliating as the admission may be, there certainly is very little in the work or actual compensations of the average farmer to attract or satisfy an energetic young man whose intellectual powers have been awakened by an academic course of training, and it is not of much use to talk to a college graduate who was reared in the stifling social and mental atmosphere, which is only too often allowed to settle upon the farmer's isolated home, about the possibilities or the future of agriculture. The impressions left by the experiences of childhood are difficult to erase. Upon the character of those impressions in a great measure depends the future of our boys. If we succeed in making farming attractive to them: if we show them by our own example and achievements—by our own intellectual attainments and social successes—that there is really nothing in the work of the farmer to prevent his becoming the equal of other business men, or to hinder his acquiring as great comforts, social privileges and political influence as the successful professional man, mechanic or merchant, we may hope to make farmers of them. If we fail to do this, we have no reason to complain if they leave the farm and engage in other and more satisfactory pursuits. To teach a full-grown farmer's boy, in an agricultural college supported by legislative appropriations, how to make farming attractive and profitable, will be found of little avail when his experience of farm life has been such as to make him hate it.

That education is best for any boy which best fits him for his chosen work. The foundation for such an education must be an intelligent liking for that work. The laying of this foundation for the education that is to fit his boys for the business of the agriculturist, is the most important duty of every farmer. If this duty is faithfully performed, the building of the superstructure will be found comparatively easy. When a boy of ordinary intelligence has acquired a hearty liking for the work of the farmer, and acquired it in what may be termed the natural way—in the healthy, bracing atmosphere of a well managed farm home—the question of his school training need occasion very little anxiety. In his case, scarcely any practicable schooling will be found greatly amiss.

The chief difficulty about the education of the farmer's boys, then, as it seems to me, lies in the failure of the farmer himself to understand and intelligently perform his duty in the premises. Whatever course of schooling the embryo farmer may subsequently take, the most important part of his education, the part which is to have the greatest influence in shaping his career as a man, ought to be that which he receives at home from his parents, and from the practical experiences of every-day farm life. The knowledge gained here is woven into the very substance of his brain and muscle, and becomes as much a part of himself and as completely under his control as his hand, eye, or tongue. The consequences of any defect in his training here will follow him through life. No other teachers, however gifted, can ever fill the place in the education of a farmer's boy that should be filled by his parents. No other school, however excellent, can fill the place that should be filled by his father's farm.

If all our farmers could be brought to realize these facts, in all their bearings, I am sure the disheartening complaint that all our brightest and most enterprising young men are leaving the farms, would soon cease. If the father can be aroused to a full sense of the duty he owes his boys; if he sees to it that their first impressions of farm life are of the right character; if he gives to their first mental growth its proper training; and, above all, if he so orders his own life as to be always able to retain that influence over them which every father should have over his sons, it does not seriously matter what particular course of study they pursue at the academy or agricultural college, or whether they go to such schools at all. An academic course of training has its advantages, but is by no means essential to a high degree of success in life. It is example, and not theory, that the agricultural student of to-day most needs. He must see farming made attractive and profitable, as well as hear that such a thing is possible. The influences of his home-life, therefore, are of vastly more consequence to the farmer's boy who is to be a farmer, than the influence of all the schools in Christendom.

Cheshire Co., N. H.

The Harlem Commons Syndicate is the name by which a little clique of claimants for a large section of upper New York seek to turn their claims into cash at an early day, by obtaining money from all who may think that it would pay them to claim relationship, and trust to big promises and the law's uncertainty for a great future reward. The syndicate was organized last December, its object being to get from New York City a large part of

what was formerly known as Harlem Commons, much of which is now covered with buildings, and very valuable. The original patentees were the Covert, Sloat, and Yates families, and it is claimed that the city has no just title to the land; but that it rightfully belongs to the decendants of these families, and all of these, real or imaginary, on the male and female sides, whatever may be their names now, are invited to join the syndicate for the small sum of $10 apiece. To hurry them up a threat is made to increase the charge to $100 per head, later on. A number of names are given as those of the "Board of Trustees," among them that of Gen. Jno. C. Fremont, but some time back he repudiated all connection with the scheme. Mention was made of the "enterprise" and claims in the papers here some time ago, and several reputable lawyers were "interviewed" on the subject; but all laughed at the notion that the claim would ever amount to anything. The Eye-Opener remembers at least a dozen such syndicates, each got up by a scheming lawyer on the most nebulous claims to large properties in this country or in England, especially in the latter. Money was always collected from the members in various assessments as long as they were credulous enough to pay; but in no single instance has any of their hopes been realized. We have had three letters of late with regard to this Harlem Syndicate, which shows that its lines for gudgeons are cast in many places.

We do not recommend the remedy for "fits" advertised by F. G. Root, of this city. Epilepsy, which produces these convulsions, has so many different forms that medical men find it impossible to give a definition of it. There are numerous known causes of it, and probably some still unknown. As in most of the nervous diseases, there is a hereditary tendency to it in the offspring of persons who have had that or various other nervous complaints, such as insanity, paralysis, apoplexy or hysteria, etc. Various malformations of the body, and especially of the cranium, are among the most frequent predisposing causes; so are dentition, self-abuse and the use of alcoholic drinks. Various diseases, especially those in which the blood becomes altered or diminished, and organic affections of the nervous system, as well as excessive loss of blood, a wound, a burn, worms in the bowels, stone in the bladder, etc., etc., have all frequently produced it; while mental excitement is known to have often caused it. Complaints peculiar to woman also frequently occasion it. For treatment, the first thing to be done is to find out the cause, and to try to get rid of it, if it still exists. Often it depends on external causes of irritation, which may be easily removed, and these should be carefully sought for, as the patient is generally not aware of them. For no other disease has a greater number of "cures" been vaunted and found useless. The metallic salts, especially those of zinc, silver and arsenic, are much employed in advertised specifics, and sometimes produce good effects; but they cannot be used long, as they would injure the health. Belladona and bromide of potassium are the most serviceable remedies, and it is much safer and cheaper in the end to have these prescribed by a good, local physician than to take them "blindly" in a nostrum put up for sale and not for anybody in particular. Bromide of potassium in 10 to 30 grain doses, taken three times a day, will produce better results as regards the severity and frequency of the attacks, than any advertised nostrum; but before taking it a physician should be consulted. In some cases no remedy will ever relieve the patient; in most cases no remedy will do more. "Cures for all cases" must be humbugs.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

MY HUSBAND'S SHIRT.

I'm afraid you may think *him* a dandy
  And mention it, to his disgrace,
When I tell you the *f ont* was embroidered
  And the neck and sleeves trimmed with soft lace.
But I ironed it with such a feeling
  As never possessed me before,
Though I'd laundried his shirts, a full hundred,
  And made them for him by the score.

But, tenderly bending o'er this one,
  I said "bless his heart," and "sweet boy,"
And smoothing the lace on the neck-band,
  I lingered a minute to toy
With the frill as it lay on my finger,
  And (though you may think I was "soft,")
I pressed two quick kisses upon it,
  And laughingly held it aloft.

I know wives don't usually do so,
  When ironing shirts for their lords;
They're more apt to indulge in a tantrum
  Or tirade, o'er their ironing boards.
But list, and I'll tell you the secret,
  And you'll sympathize with me I know,
As one woman will, with another,
  If she the "white feather" will show.

My little girl up to her Grammy's,
  Was staying, the morning before,
And while she was rumaging, child-like,
  'Midst some duds in an old bureau drawer,
She captured a shirt which her papa,
  When he was a baby, had worn,
And begged it to rig up her dolly;
  And as it was wrinkled and torn,

Returned home, she said, "Mamma wash it,"
  And so as I did her behest,
And thought how my terrible giant
  Within its wee size had been pressed,
Do you wonder I said "bless his heart," as
  My fancy presented to view,
A miniature phrase of the monster
  Who now measures just six feet two?

—*Virginia C. Hollis in Good Housekeeping.*

POINTS FROM MANY PENS.

Silver "grape tongs" are a novelty in table ware. They are slipped over the forefinger and thumb when eating asparagus or bonbons.

Silver corn-shellers are a new and pretty wedding gift, removing the impossibility of eating corn on the ear gracefully. They may be purchased singly or in sets.

The rolling-pin key-holder has now made way for the potato masher, to be devoted t the same use. This utensil is gilded, tied up with ribbon and finished with four brass hooks screwed in at any desired angle.

An appropriate companion to the above is a match-scraper in the form of a gilded, miniature washboard. Probably the next thing in "art" decoration will be an antique gridiron adorned with tissue-paper flowers.

Tissue-paper flowers, though flimsy, are not by any means to be despised. When well made, they are astonishingly real in appearance and make a most effective decoration. A package containing vari-colored paper, rubber stems, gum and working utensils, and instruction book is offered for sale at many decorative art stores.

Fans, covered with one immense paper pond lily, are effective for wall decoration, while porcelain lamp shades are often covered with a mass of these flowers, mingled with natural ferns pressed and varnished. The newest fringe or bordering in decoration is exactly like crimped-tape mourning fringe, save in color; it comes in all the dainty hues now in favor. It makes a charming border for upholstered gipsy tables, and is much used on Moorish table scarfs.

A pretty paper holder or wall pocket is made from "tea-matting," the fabric used in wrapping tea boxes. The material is bound with ribbon of harmonizing hue; the lower part turned up pocket-fashion, with a bow of mingled ribbons on each side. One upper corner is turned down slanting with another bow, and some odd design is painted across the top in metallic colors. The word "Papers" is painted across the pocket in eccentric letters.

The Health Department of the W. C. T. U. has prepared a course of study embracing two years' work, which will prove of great value and interest to women. The first year's course is the "Relation of Health to the individual," relating to physiology, anatomy and hygiene; the second, the "Relation of Health to the Family," giving most thorough knowledge of sanitary and hygienic housekeeping in every department. It is a most useful course to every woman striving for a higher level in her household.

THE WORTH OF EARLY LESSONS.

While spending a few days at the house of a relative, I saw one of her daughters, a girl of 11, making a doll's bonnet out of a bit of blue silk. It looked so wasteful to my narrow mental vision that I called her mothers attention to it. "Oh, Cousin Delia" I said, "Your Anna is cutting up a piece of good silk to make a paltry bonnet for her doll. It is a lovely piece to put into your crazy quilt." "I'm not puzzling my head with crazy quilts yet. When I make one, it will be composed of clippings left by the children after cutting things for themselves and their dolls." "But a scrap of any common stuff would do for the child to cut up for that silly thing," I pleaded. My hostess looked amazed. "Amanda, the child is learning a lesson in millinery that will benefit her in life. I gave her leave to use that silk, and I assure you it will not be wasted." "But don't you think you are allowing her to waste good materials, for poor results? I should be afraid she would become extravagant." As the youthful milliner was in another room, our comments were not heard by her. Presently she came in with the diminutive bonnet, and showed it to her mother, who looked pleased, and said "you have made it well, Anna, in fact quite in the fashion." The child's face was radiant with pleasure. "Oh, mother" she said, it fits dolly so nicely. I did not cut the silk at all, I turned it under here and there, so that I can use it for something else," and she skipped away and left us. "She is ingenious, Delia, I must confess, but all girls of her age, cannot be trusted with nice materials to use." Train them carefully Cousin Amanda, and then they can be trusted. Lay responsibility on children early, and you will inspire them with confidence in their own bility. It is real economy to teach girls to cut and make plain garments for themselves, and no person will instruct them as patiently as their mother. It is natural for them to like to do fancy work and no urging is required in that direction, although care must be taken that each piece is finished before another is commenced." SOPHIA C. GARRETT.

RECEPTION DAYS.

ZEA MAYS.

Why cannot farmers' wives have reception days. I do not mean for intimate friends, or those from a distance; but for those good neighbors, who get their work done up after dinner, and taking work-bag on the arm, come to spend the afternoon and take tea. It would be quite an innovation—perhaps would cause some talk, even scandal! but what improvement it would be! Now one never knows when her privacy may be invaded by an uncongenial neighbor, or when, if her larder happens to be a little short, she may not be called upon to improvise a tea for an uninvited and critical guest. She may have planned for a quiet afternoon nap, or for a precious and long-coveted sit-down with a favorite author; no matter; she must entertain and be polite to one whom she wishes was in Guinea. A reception day, don't you see? would largely change all this, you could get your washing done on Monday or Tuesday, your ironing and mending finished, plenty of good bread baked, with light biscuit if you pleased, a cake or two, and a few pies if you use them, and having plenty of canned fruit and butter, with perhaps dried beef or honey, if about Thursday or Friday, several of your neighbors happen to come in, you are ready for several hours social chat, and all you need do is to boil the tea-kettle, and suit your table-arrangements to your company. How different this from having to build a hot fire when you had thought your own family provided for, and go and bake warm biscuit and cake, having first, possibly, to go and borrow flour or baking-powder of the nearest neighbor. It may not be the best house-keeping to be out of these necessaries, but, nevertheless, people do get out sometimes. A reception day for the little girls too, is quite a necessity where thoughtless neighbors allow their children to impose upon you.

"THET NEW HOUSE."

ANTY VEE.

Although I'm an old woman, yet I can see, and can hear and talk, and I keep trottin' aroun' from house to house, and from cellar to garret all throughout this county, and into one or two adjoining oues. Now I must say I don't like the way our houses are being built. The bed-rooms all on the second floor, and so small, too; I'd use 'em for corn cribs. You can't stand at the head and walk aroun' to the tother side of a coumon sized bedstid in one of 'em. And when you open your eyes, there the light is jest shinin' right into 'em. Such close, leetle, unbearable bed-rooms! Ef I was goin, to build I'd have a bed-room at least four inches larger then the bed-stid. I believe men have a right to say all nbout the farm and bout the barns; but when it comes to the house, then it's woman's turn. Last week I was up to Barry's, he who's built a big, white house and green blinds. And he tuk me over the hull of it, and he told me how much this cost, how thet was terribly dear, and thet "no other man in the county hed such a buildin" with so many improvements, and thet the carpenter sed it couldn't be beet," and all thet, etc., an so on. And sez I, "How duz the wife like this, and *this?*" sez I, pintin' frum one thing to another with my index finger. "Oh," sed he, "thet's the carpenter's plans." Well, when we'd got all around, and he sed he'd feed the teem, I walked straight on with him toward the barn, and after we hed cleared the new house, sez I, "Barry, is thet house insured, insured for all it's worth?" "Why," sed he in great surprise. "'Cause," sed I, "the furst thing I'd do would be to burn the whole durned thing to the ground." Now Barry was a deacon, and I was a professed Christian, and my words stunned him like. Then he tuk my arm and led me back into thet house, and sez he, "See what a great magnificent parlor!" "And see thet leetle smich of a bed-room," sez I, "hardly room to squeeze a common sized bedstid into it; and you, a great lumberin' two-hundred-pounder! I'd hev you sleep on a perch outside if you like a small place." "Eh," sez he, "I ginerally git to bed long before Susie comes. She's meudin' for me and the children, and then she don't miud about gettin' in back as she's always timid and afeered burglars might come aroun'." "Doesn't take any courage to sit up and mend," thought I, but I didn't say anything about thet, ez my principle is to never, *never* meddle. He agin called my attention to thet "magnificent parlor." "Yes," sez I, "its big, treemendous big, and not a thing in it! Blessed ef I wouldn't put my bed up in it and sleep there too." I could see Susie's eyes brighten, and I went it good and strong, and pinted out a good menny advantages, and how much they'd save and the doctor would lose. A day or two after I'd got home, a postal card cum, saying, "I hevn't felt so rested in a long time ez I do this mornin'. I slept so good last night in our bed thet Barry and I hev put up in the big parlor. Yours, Susie."

REST AND HEALTH.

The use of rest—absolute rest—as a health restorer is too much neglected, especially among those who really have the greatest need of it." Tired nature's sweet restorer, balmy sleep," is indeed a great panacea, but it is not the only one. Too often the tired house-mother keeps at her treadmill of domestic tasks until sleep is well-nigh impossible. She lies down with every nerve at loose ends, irritable and debilitated; small wonder that sleep only visits her by fits and starts. If an hour or two before bed-time is spent in simply resting, without any attempt to exert either mind or body, she will regain three-fold in peaceful, dreamless sleep, awaking with new energy on the morrow. Of course, she may leave something undone—there are always loose buttons and torn clothing to occupy the evening hours, but what are these compared with the mother's precious health? Physicians lay much stress on the benefits resulting from change of occupation—thus a schoolgirl who studies four hours a day and busies herself about the house another four hours, will learn much more rapidly than one who studies continuously eight hours. The same thing is true in domestic work; the woman who has other interests is pretty sure to be the brightest and most capable. She does not get into one narrow rut. Experience in various charitable societies has shown the writer that the women who do the most work for other people, are always the most notable housekeepers. "As thy days, so shall thy strength be." I am persuaded that the work we freely do for others reacts on our own personality giving us greater strength for our daily task. Mind, I don't say that every overworked mother must rush into work she has not strength for, only that every busy woman should have something to think of besides her daily work, whether it is a new book, a flower garden, or clothing and sweet sympathy for the needy, we can all do something to make this world brighter. EMMA LEIGH.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

AN AMATEUR COOKING CLUB.

CAUSED BY THE WONDERFUL RECIPES OF THE RURAL.

For the past few weeks several of my girl friends have been holding secret meetings at each others' houses and congregating in the kitchens, whence Bridget was summarily banished and whence were presently heard to issue sounds of gay laughter. They have worn pretty blue badges with A. C. C. embroidered on in old gold, and when asked the meaning of these mysterious hieroglyphics, they would mischievously reply: "Amiable Cheshire Cats." The mystery was at an end when one day I received an invitation to a dinner given by the "Amateur Cooking Club." It was a marvel of skillful cookery, each dainty dish having been prepared by a different member of the club. The menu is given below:

Bisque of Lobster.
Salmon Croquettes.
Leg of Mutton braised with Green Peas.
Oyster Omelet.
Sweet Potato Fritters.
Apple Cheese Cakes.

Bisque of Lobster.—Remove the stomach, head and black vein from a boiled lobster. Set aside the meat from the tail and claws for a salad, and pound in a mortar all that remains, the small claws, the large shell and all the matter found in it. Set a saucepan containing a tablespoonful of butter on the fire; when the butter is melted put in the pounded lobster and stir for ten minutes with a wooden spoon, then add a quart of hot veal stock, and simmer slowly for 20 minutes. Strain, return to the fire, add a cup of hot cream that has been thickened with a teaspoonful of flour, the coral of the lobster, if any, which has been dried in the oven and pounded fine, and half a cupful of little dice of the flesh of the lobster. Give one boil, season to taste and pour into a tureen over little dice of fried bread. "This quantity," said the blushing author of the above delicacy, "is sufficient for eight persons and was made from one good-sized lobster. A cupful of the meat still remains for a salad or cutlets or patties."

Salmon Croquettes.—Take one large cupful of cold, boiled salmon minced fine. Work in a tablespoonful of melted butter, one beaten egg and a teaspoonful each of lemon juice and anchovy sauce. Put these ingredients in a saucepan over a slow fire, and stir in a half cup of sifted bread crumbs, salt, pepper and a bit of nutmeg, moistening with a gill of cream. Make into small, pear-shaped rolls, egg and bread crumb them, and fry in boiling dripping. Serve on a mound of mashed potatoes. They may be prepared in the morning and kept in a cool place until you are ready to fry them.

Leg of Mutton Braised.—"One cannot live on delicacies alone," said the pretty girl who dispensed this dish, "and it has fallen to me to prepare this substantial but I hope tasteful dish. Have the butcher bone a leg of mutton and tie it in shape. Brown it in a stewpan with a little butter, and when it takes a good color add a pint of water, half-a-dozen button onions, four small French carrots, and salt and pepper, and simmer slowly for six hours, turning frequently the while. Place on a hot dish, free the gravy from the grease, thicken it with a little flour, add a

spoonful of mushroom catsup and pour over the mutton. Serve with green peas."

OYSTER OMELETS.—"I have made most of the omelets given in the RURAL of the 27th of February," said a rosy Miss, "but I claim the credit of having invented this particular one. Drain at least a dozen oysters and keep the juice. Fry out the fat from six thin strips of larding pork one inch wide and two long, lay in the oysters and shake for a minute or two, until the beards just begin to open. Meantime cook in another pan an omelet of six eggs, and have it ready just at this minute to fold, lay in the oysters which you have lifted from the fat with a skimmer, fold and turn out upon a hot dish," Although I am little of an epicure, I shall carry through many a day the savory memory of that omelet.

SWEET POTATO FRITTERS.—Take three or four plump sweet potatoes, wash and peel them and cut them into slices lengthwise, and about a quarter of an inch thick. Soak them for half an hour in brandy with a little lemon peel in it. Then drain, dip in fritter batter and fry in hot dripping. Sprinkle with powdered sugar and serve.

APPLE CHEESE CAKES.—Take half a pound of pared and cored apples, half a pound of sugar and the thin rind of a lemon chopped. Stew all in a cup of water, Beat up well with the yelks of five eggs and the whites of three. Then melt three ounces of the best butter, mix all together, and bake in patty-pans lined with good puff paste. "The next display of the accomplishments of the Amateur Club," said Miss Gladys, the president, rising and displaying a thousand dimples, "will take the form of a breakfast."

PALMETTO.

KITCHEN TALKS.

ANNIE L. JACK.

I ALWAYS think Spring is the hardest time for farmers' wives; so much work has to be crowded into a short space of time, especially at the North. To be cook, and dairy-maid, laundry-maid, kitchen and parlor-maid all in one, is in itself no sinecure. To raise calves, pigs and poultry, too often falls to her share of the work, and she goes on her way with imperfect facilities for doing the work easily. One of the things that a farmer's wife has to attend to that does not disturb her city sisters is the drying of feathers from poultry that have been used all Winter. There is a panful in the oven just now, and it incommodes one when the oven is needed. But the feathers must not be wasted. Even the large ones can be stripped from the plumes, and used instead of batting for quilting in comforters. They are best inclosed in a tight bag and washed; then they become light and are clean. When drying in the oven they are quite a trial—somehow they will escape into the kitchen, while if you open the oven door to stir them, and even breathe on them, the fluff flies up into your nose and mouth in a very awkward fashion.

The amateur laundry-maid is busy cleaning her irons. She has a lump of wax tied in a rag, and rubs them when hot, then scours on a paper sprinkled with salt, and they become bright and clean. Can any of our RURAL readers introduce us to an easy-working and improved sad-iron?

A WEEK'S WORK AT MRS. HOMESPUN'S.

SATURDAY.

BREAKFAST being over, Mrs. Homespun began her weekly house-cleaning. Door-knobs were rubbed bright, window and door-casings were washed; the glass in the windows was polished; carpets were swept, papers sorted and put away to be preserved; books and furniture dusted, and every room in the house received its proper share of attention. The meals for Sunday were arranged for, so that they could be prepared with the least expenditure of labor. Cold, boiled ham, baked potatoes, bread and butter with canned strawberries, formed a part of the bill-of-fare. "I have had a new experience in canned fruit this year," said Mrs. Homespun, as she set down a glass can preparatory to opening it. "I had no good place except the cellar to keep any of my canned fruit; and to keep it cool through the very warm weather I packed the cans in salt, in a box. If I had only allowed the salt to come about two-thirds of the hight of the cans I think it would have been better; but the salt seemed to unite with some chemical in the metal covers that nearly ruined them; but as they were porcelain-lined, no harm was done to the fruit, and you see," she added proudly, "that they have kept in splendid condition." Next, she grated horse-radish enough to nearly fill a quart glass can, covered it with vinegar and set it away in the pantry for future use.

A PLEA FOR FANCY WORK.

WHY so bitter against fancy work, oh "Country Housekeeper"? Every spare moment cannot be spent in reading, no matter how one loves it; the brain tires, and often when doing this same fancy work which you say "only employs the fingers," the mind is busy, oh, so busy! and things we have read are pondered over, and thus more firmly impressed on our minds.

Did our Great Creator do no fancy-work in making this world of ours? Had He left out the beauties of Nature, which some may term useless, what a dreary world this would be.

God implanted in us the love of the beautiful, and surely when the Israelites were building the Temple, by God's direction, fancy-work came in for a goodly share of attention.

Why "put a few tucks" on our under garments? Tucks are of no use, only for show, while trimming preserves the edges of the garments and they wear longer, even if that same trimming is home-made.

"Hideous ornamentation of heavy home-made trimming"! Well, I have made a good many nice under-clothes lately, and much of the trimming has been home-made; light, airy, and beautiful, yet durable.

As for crazy-work, I have never done any; but I have seen some of it which was beautiful, and the makers thereof were not wanting in more solid sources of enjoyment; but did this in play-spells.

I have always encouraged my girls in their wish to do fancy-work, as it teaches them to sew neatly, and they are much more willing to learn on something pretty than on the old-fashioned patch-work, which our mothers made us do in our childhood—a good lesson, but so dry and uninteresting.

Yes, I believe there is a time for fancy-work, as well as for solid reading and hard work.

AUNT EM.

HANGING BASKETS.

THE following is a very pretty novelty. Saw off one end from a cocoanut, and bore four holes through the upper edge, through which run a scarlet silk cord. Gum on the outside, with mucilage, the pretty lichens that grow on the branches and trunks of trees. Get as great a variety of shades as possible, and you will have a beautiful ornament. I saw over a friend's mantel a small branch of a tree that had been covered with these lichens. A bird's nest was fastened in, and with a bright spray of autumn leaves behind it, I thought it a charming decoration. Pasteboard frames with lichens sewn on frame photographs very nicely.

MAY.

BED-ROOM CURTAINS.

I RECENTLY made a very pretty pair of bed-room curtains out of thin, unbleached muslin at three cents a yard. It resembled cheese cloth, and I ornamented it, top and bottom, with wide bands of Turkey-red cotton. Looped back with ribbon of the same shade, they were as graceful and bright as if they had cost much more.

For the same room, which needed a rocker, I tried my hand at upholstering. An old cane-seated rocker was found. This I painted a bright red, that is, the wood-work of it. I fashioned a seat by firmly tacking on a net-work of stout strips of ticking. This I stuffed with excelsior with a covering of cotton, and over all a bright piece of cretonne was tacked on. I made a little cushion or head-rest for the back to match, and tied a bow of red ribbon over one of the knobs at the back, and now Jack says it is the prettiest chair in the house, and wants it in the parlor.

My parlor, by the way, is sadly in need of a new carpet, and as that is out of the question, I shall try my hand at painting the floor. I am busy making a large rug for the center of the floor, that promises to be very effective. It is made of remnants of carpet (new) of all sizes and kinds; some have been given me by friends. I take pieces of any shape—squares or triangles—and trim with the least possible waste so as to fit together. Sew them very strongly with a seam on the wrong side, and line it with bagging, and bind it with carpet binding. Some bits of velvet carpet give it a very rich appearance. I am told that at carpet stores in large cities you can buy small remnants of carpet very cheap. I call it my crazy patch-work rug, and shall make a smaller one for the fireplace, which I shall edge on two sides with fringe.

MRS. V. D.

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

Vitality and Color

Are restored to weak and gray hair, by the use of Ayer's Hair Vigor. Through its cleansing and healing properties, this preparation prevents the accumulation of Dandruff, and cures all scalp diseases.

When I commenced using Ayer's Hair Vigor my hair was weak, thin, and gray. My scalp was also full of dandruff, and itched incessantly. Two bottles of the Vigor removed the dandruff, stopped the irritation, restored my hair to its original color, and so stimulated its growth that I now have an abundance of long black hair. The occasional use of this remedy keeps my hair and scalp in perfect condition.—Florence J. Cannon, 759 Clinton st., Trenton, N. J.

Ayer's Hair Vigor

is, in every respect, the most cleanly of all preparations for toilet use.

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.
Sold by all Druggists and Perfumers.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

DAIRY THERMOMETERS!

Every farmer should have one. Sent safely by mail for 50c.

Send for Catalogue of Thermometers, Lactometers, Creamometers, and Thermometers for Incubators.

W. M. McALLISTER, Optician.
720 CHESTNUT STREET, PHILADELPHIA, PA.

IT is the undivided opinion of the medical world that rheumatism is caused by the acid condition of the blood, the taking of cold, exposure to inclement weather being merely the occasion of its development in some part of the body. Its especial liking is for the joints and the sciatic nerve. When inflammatory, it attacks the entire muscular system, and is very dangerous; painful at all times, dangerous in many, the person who is afflicted with it should give himself prompt treatment with Warner's safe cure and Warner's safe rheumatic cure, two remedies which have no equal in the world for clearing the system of the acid elements which are the only causes of the rheumatic condition.

PURE MILK.

WARREN MILK BOTTLES

Patented March 23d, 1880.

Adapted for the Delivery of Milk in all Cities and Towns.

A Long Needed Want at last Supplied.

DESCRIPTIVE CIRCULARS ON APPLICATION.

A. V. WHITEMAN, R. N.,
72 Murray Street, NEW YORK.

HERCULES WIND ENGINE.

Before you buy send for description and prices of the

BEST WIND-MILL

ever invented. It is the most durable, most ornamental, most powerful, strongest, steadiest, cheapest, is not liable to be wrecked; has automatic governor; can be placed in cupola of barn, or upon a tower, and is the ONLY RELIABLE GEARED MILL for driving machinery. The Geo. L. Squier M'f'g Co., BUFFALO, N. Y., Sole Manufrs. AGENTS WANTED.

Territorial News.

LEWISTON, Idaho Ter., Jan. 8, 1885.—A long time I have suffered with pain between my shoulder blades, loss of appetite, sickness of the stomach, pain in right side. No doubt liver complaint. Six bottles of Warner's safe cure made me well and sound.—W. S. DYER.

Grind your own Bone, Meal, Oyster Shells, GRAHAM Flour and Corn in the $5 HANDMILL (F. Wilson's Patent). 100 per cent. more made in keeping poultry. Also POWER MILLS and FARM FEED MILLS. Circulars and Testimonials sent on application. WILSON BROS., Easton, Pa.

TELEPHONES SOLD.

Don't pay exorbitant rental fees to the Bell Telephone Monopoly to use their Telephones on lines less than two miles in length. A few months' rental buys a first-class Telephone that is no infringement, and works splendid on lines for private use on any kind of wire, and works good in stormy weather. It makes homes pleasant; annihilates time; prevents burglaries; saves many steps, and is just what every business man and farmer should have to connect stores, houses, depots, factories, colleges, etc., etc. The only practicable and reliable Telephone that is sold outright and warranted to work.

Chance for agents. No previous experience required. Circulars free. WM. L. NORTON, Buffalo, N. Y

FREE TO LADIES!

Send ten 2-cent stamps to pay postage, and we will send our Family Story Paper three months, also 12 Montague Curl Clasps free. The most useful and convenient article ever used for the hair. Warranted to curl the straightest hair, without breaking or injuring it in any manner. No lady would be without them after once using. Address,

SOCIAL VISITOR.
Box 3139, Boston, Mass.

State age and previous occupation. Name this paper. New England applicants address us at Boston; York State and West, at Geneva, N. Y., Penn., N. J., and South, at Phila. State age. R. G. CHASE & CO.

News of the Week.

HOME NEWS.

SATURDAY, May 29, 1886.

EX-PRESIDENT ARTHUR is slowly, but steadily failing, and all his friends now hope is to carry him through the Summer. Lately he rode out in a carriage three times, but the consequent reaction confined him to bed for four days. Greatly emaciated; very feeble. ..OnJuly 14, 1880, Willard Fiske, a Professor at Cornell University, married Jennie McGraw, a hopeless invalid, but very wealthy. A year later she died and he got a legacy of $300,000 out of her estate worth $2,025,933, he having agreed to make no further claim. Her father had given $100,000 to the University and she left it property valued now at about $1,500,000. Six months after the settlement of the estate Fiske went to Europe, where he has since remained, but employed lawyers to contest the legacy to Cornell on the ground that a clause in its charter limits its holdings to $3,000,000, and that it held property worth more than that already, therefore the legacy was void and he inherited as heir at law. The court, Wednesday, decided against him..... ....The hostile Apaches are still murdering in the Southwest, and trying to get "reservation" Indians to join them. Report says Gen. Miles has offered $50 for each Indian or head of Indian and $2,000 for Geronimo or his head. The Government knows nothing about such offer, and under no circumstances would sanction such a barbarous warfare. Arizonaians offer the reward, however, and will pay the bill .. ...The people of Eastern Montana are mad at the proposed extension of the Cheyenne Indian Reservation to the Tongue River. At present it is 30 miles long by 20 wide, or 600 square miles, or about 385,000 acres. There are about 700 nomadic Cheyennes, who have already, therefore, nearly a square mile apiece—buck, squaw and papoose. The extension would embrace the homes and farms of a large number of bona-fide settlers, and would close the principal cattle trail from Southwestern Montana and Northern Wyoming. Generosity to the red man should not work injustice to the white..... Estimated by the number of names in the new city directory, Chicago has now a population of 750,000. St. Louis sure to protest or "go 10,000 better." .....Representative Bland, of Mo., has introduced a bill to restore the income tax, proceeds to be applied to the payment of pensions.....Zenas Fisk Wilbur, who, as Examiner in the Patent Office, passed Alexander G. Bell's application for a patent for "multiple telegraphy" in 1876—original "telephone patent"—swears that he gave Bell Patent Office secrets, especially with regard to Gray's application for a telephone patent, and thus enabled him to improve his original claims, which related to telegraphy, not to telephony. For this fraudulent conduct Bell and his lawyers made him presents and "loans." Bell says the story is made out of whole cloth... Snow to the depth of several inches was reported yesterday in various towns in Northern Vermont.....A Canadian fishing boat was seized at Portland, Me., for not having a manifest of her cargo—20,000 mackerel—usually not asked for though legally required. Captain fined $500—more than the worth of the boat. Fine may be remitted.....Canada is fitting out six steamers and as many schooners "to protect the fisheries." Our Government acting energetically in negotiating with England. Both Houses of Congress have passed the Dingly Shipping Bill with an amendment authorizing (asking) the President by proclamation to deny commercial privileges in all our ports to the vessels of any country that denies them to our vessels. The "war" to be waged on the lakes and rivers as well as on the ocean. Exasperation certain; serious trouble hardly probable. ....A good deal of agitation in Nova Scotia, as elections are to be held on June 15. All things point to a great Liberal majority, as that party favors secession from the Dominion and direct relations with England. Some talk of forming a separate confederation of the Maratime Provinces, including Nova Scotia, New Brunswick and Prince Edward's Island, and possibly Newfoundland. Some talk of annexation to the United States. Separation from the Dominion is what is chiefly desired, however....No more tinkering with the tariff need be feared at this session of Congress..... ....Clifton, Dak., is to have a cyclone cave large enough to hold the population of the whole town.....Brooks has discovered another comet; six within telescopic sight now. Two periodic; one here last in 1815. Warner, of Rochester, pays $100 apiece to the discoverers of new comets.....A $1,000,000 fire in Chicago Wednesday—publishers and lithographers the chief losers, and the owner of the fine six-story brick and stone building cremated.....Indiana Prohibitionists are to run a State ticket, and in convention, Wednesday, declared in favor of unqualified prohibition of intoxicants, strict observance of the Sabbath and woman suffrage.....New Jersey prohibitionists nominated a State ticket yesterday, and are going to make a vigorous fight without "entangling party alliances."... A House bill introduced Monday provides for the election, on the general ticket, of a second Vice-president to be President in case of removal, death, or resignation of President and Vice-president, and to be Vice-president in case of the elevation, death, or absence of the latter.....After all, what a sensation it would be should the Keely Motor turn out a success! Some of the reports of the late experiments intimate the possibility of the miracle.....The Chicago Grand Jury have found true bills for murder, as accessories before the fact, against the Anarchist leaders, August Spiers, A. R. Parsons, Samuel Fielden, Michael Schwab, and Herman Schnawble. These are the demagogues whose vaporings incited the late murderous riot in Chicago. The rascal who threw that bomb, which killed five policemen and injured 16 more, maiming some for life, is in custody, and it is believed 19 others were ready to hurl a bomb apiece when frightened off by the premature action of their comrade, and the consequent fire of the police. Twenty indictments of Anarchists, in all.....There's a scheme afoot to connect the Delaware and Chesapeake Bays by a canal 17 miles long, Baltimore subscribing $500,000 of the capital stock. An English company will furnish 80 per cent. of what's needed, if 20 per cent. is raised here..... The estimated National revenue for the current fiscal year is $175,000,000; and the appropriations call for $150,000,000 for outlay—only $25,000,000 left to pay interest on the national debt and to lessen the load. Revenue this month $16,000,000 over expenditures—there will probably be a decrease of $12,000,000 in the public debt .....The Canadian House of Commons has given a majority of 73 in a house of 159 members, against the abolition of duties on coal and breadstuffs, and this is considered fairly indicative of the popular feeling on the matter. Since the imposition of the duties the average value of the annual imports of breadstuffs from this country has decreased from $6,676,000 in 1874–78 to $3,130,500 in 1878–84, while the output of the Nova Scotia coal mines has doubled, and it is claimed that, taking an average of years, the prices of coal and breadstuffs have not increased..... ....All big strikes collapsed or collapsing; little ones are likely always to be too numerous for mention. Largest meeting ever held of Knights of Labor and Trades Unions now in session at Cleveland, Ohio. Much disagreement and a bitter fight between the Knights and the Unions as to which shall regulate strikes, boycotts, etc. Nothing certain now—wait for a week..... ....Congress seems willing to admit the whole of Dakota as a State; but the House objects to a divison of it into two.....Jaehne, the boodle New York alderman, is better in prison than elsewhere, being "quiet, industrious, and orderly" while starching shirts.....The accumulated photographs of babies that have been named after the President, number some 700, and fill three drawers in a White House closet.....There's a lively fight in the U. S. Senate over the confirmation of ex-Gov. Glick, of Kansas, as pension agent at Topeka, as the Kansas Senators are not enthusiastic in his favor. He'll probably go through, however.....The Grant Monument Fund has increased very little of late, and the trustees make one more appeal to public patriotism. It is now only $121,160.....It cost this city $3,000 to prove Jaehne's rascality..... ...Meetings in favor of Irish Home Rule have been the order of the day all over the country of late. Many of the State Legislatures and municipal bodies have passed resolutions commending the measure and lauding Gladstone for championing it. These have been engrossed and forwarded to the Old Country. James G. Blaine will speak for his forefathers' land at a large meeting to be held at Portland, Me. Governors, Mayors and other "big bugs" usually preside on such occasions. Many of them care little about anything Irish, except the Irish vote. Thursday night Gov. Foraker of Ohio, presided at a monster meeting at Columbus.....,For three hours Monday night Toronto, Canada, was under mob rule, owing to a strike of street car drivers and conductors. Between 30 and 40 street cars were wrecked and the passengers and "scab" drivers and conductors were pelted with bricks, stones and other missiles. Nobody seriously hurt, however..... .....It is reported that the Mormans intend to boycott the Gentiles in Utah. .....The annual report of Dominion fisheries show a decrease of nearly $500,000 in Nova Scotia alone. The total value of Dominion fisheries is placed at $17,722,973, of which Nova Scotia is credited with $8,263,923, New Brunswick with $4,005,430, Prince Edward Island with $1,293,430, British Columbia with $1,078,038, Quebec with $1,719,460 and Ontario with $1,342,692.....

FOREIGN NEWS.

SATURDAY, May 29, 1886.

OWING to the fight between the consolidated cable companies and the Mackay-Bennett lines, the price for transatlantic cablegrams is excessively low—lower by far than it ever has been or is likely to be again, as the present rates are ruinously unprofitable. They account, however, for the enormous amount of foreign news in our newspapers of late—a quantity altogether disproportionate to the importance of the events discussed..... By masterly management the "Grand Old Man" has obtained a much better chance of ultimately passing his Home Rule Bill, and won the name of "Old Parliamentary Hand" in addition to his other titles of admiration or affection. By vague promises of concessions to the Radicals, very positive threats of dissolution of Parliament, and vigorously working the caucus machine organized by Chamberlain, he has won over all the doubting Thomases, and some of the recalcitrant Radicals, so that it is quite likely he will secure a majority to allow the "second reading" of the bill. This will amount to a Parliamentary affirmation of the necessity of Home Rule for Ireland. The nature of the Rule is a matter of minor importance. After the bill is read a second time it will probably be withdrawn till next session of Parliament to allow time for full consideration, and to permit other needed legislation. If the motion for a second reading is defeated, Parliament is certain to be dissolved, and this will probably happen in any case, as it is desirable that the people should have an opportunity to express their wishes on such important legislation, before the bill is finally acted upon in the Commons. Gladstone believes the people will support him by giving him a handsome majority, and he can then with a bolder face and stouter heart face the certainty of bitter opposition in the Lords.....The Greek army has been reduced to its original size before the late troubles began. The large European blockading fleet is to be withdrawn from the Greek coast. The country is staggering under a very heavy load of debt. It has made such a rumpus, however, that its territorial claims must be taken into account whenever the "Eastern question" comes up again. The scrimmages on the frontier were due to the action of the Turkish troops in firing on numbers of their unpaid and half-starved comrades who were deserting to the Greeks at night. The latter heard the firing, and, dreading an attack, fired back. Then the Turks supposed the Greeks were attacking them, and so the muddle led to considerable bloodshed. About 175 Greeks were killed and many more wounded—no account of Turkish loss..... ....In France the most significant event of the week is the introduction into the Assembly of a government bill providing for the expulsion from France of all the descendants of former rulers of the country. It is directed against the Orleans princes, and especially the Comte de Paris, who since the death of the late Comte de Chambord, has been acknowledged by all Legitimists as well as Orleanists, to be the rightful heir to all the claims of the old line of French kings. Paris and the other large cities are still vehemently republic; but monarchy is becoming popular among country people. Since the foundation of the present Republic, over 15 years ago, the Princes have lived quietly in France, and it doesn't look well for the stability of the present form of Government that its fear of their growing popularity should now lead to their expulsion. Can't they "conspire" even better abroad? Didn't the boldest and most fortunate of all conspirators, Louis Napoleon, achieve success by conspiring in exile?..... The Czar, in his return to St. Petersburg from the Crimea, has been feted and "addressed" at all important places along the road, especially at Russia's old capital, Moscow, which is intensely religious and per-fervid in the belief that Russia should be for Russians. The addresses (doubtless read privately to or by him beforehand) all expressed the hope that the cross (Russian, of course) would soon wave from the top of St. Sophia, the chief mosque in Constantinople, and before the Turkish conquest, the St. Peter's, of the Greek Church. The tenor of the addresses, the wild enthusiasm that hailed them, the Russian attitude in the Greek embroglio, and the late remarkable manifesto of the Czar to the Black Sea fleet are thought a trifle menacing to the "peace of Europe."

AGRICULTURAL NEWS.

SATURDAY, May 29, 1886.

THE Canadian cattle exported to England are reported to be much poorer in quality than those received there from this country, so that the advantage they have of being admitted into the interior, while ours are slaughtered at the port of debarkation, is to a great extent counterbalanced by their lack of quality. Canadian exporters are said to have lost a good deal of money last year....."Winter cholera" prevalent in the West, is thought by physicians to be due to bogus butter..... Armour & Co., of Chicago have executed a contract to supply the French Government with 7,000,000 pounds of beef for the French army, to be put up in special cans..... We import 16,000,000 dozen eggs a year!..... Dr. Pauren is no longer the State Veterinarian of Illinois. Pleuro-pneumonia contagiosa no longer exists among cattle in Chicago—cause and effect?.....Freight rates on flour from Minneapolis to New York have been reduced to 27½ cents per 100 pounds. They are 25 cents from Chicago .....The French embargo on American pork is still a subject of mild agitation in "frog-eaters' land," the farmers supporting it and the working people—chiefly in cities and large towns—objecting to it. Petitions for and against reach the Government about once a fortnight.....England buys $19,252,884 out of the $20,805,824-worth of the bacon we export; of hams, $2,454,080 worth of the $3,231,609; nearly half of the $3,462,539 of pork, and about one-third of our surplus lard.....R. Anderson & Co., grocers, at Stillwater, Minn., were indicted Thursday for selling butterine. This i is the first indictment for this offense in that State.....

"ANOTHER HOUSEHOLD NECESSITY."

IN a recent number of this paper was published a reporter's interview with Mr. Joseph Wild, the venerable and estimable head of the firm of Joseph Wild & Co., of 82 and 84 Worth St., New York, in which he related his experience in the use of the remedial agent known as "Compound Oxygen" administered by Drs. Starkey & Palen, of Philadelphia, which he heartily endorsed. An error in the heading of the article gave to Mr. Wild the credit of being the inventor of "Linoleum," which, as the letter below will show, Mr. Wild hastens to disclaim.

JOSEPH WILD & CO.,
82 & 84 WORTH ST. AND 11 & 13 THOMAS ST.,
New York, May 13, 1886.

Drs. STARKEY & PALEN, 1529 Arch Street.,
Philadelphia, Pa.

DEAR SIRS:—The article entitled "Another Household Necessity—Mr. Wild the inventor of Linoleum, notes a discovery as valuable as his own," published in the Scientific American of May 8th, is misleading, as stating that Mr. Joseph Wild was the inventor of Linoleum. It should have stated that Joseph Wild & Co., 82 & 84 Worth St., New York, are the owners of the patent in the United States and sole manufacturers of Linoleum in the United States. Please insert the above in the papers that have had the mistaken advertisement.

JOSEPH WILD.—*Adv.*

Crops & Markets.

SATURDAY, May 29, 1886.

SERIOUS damage is reported by chinch bugs in portions of Kansas and Illinois, especially in Bond, Hamilton and Richland counties, in Southern Illinois., and in Johnson and Osborne Counties, Kansas. The Hessian Fly is also depredating there. Grasshoppers are doing injury in Allen and Wyandotte Counties, Ohio; while heavy rain storms have injured growing crops in parts of Ohio, Iowa and Nebraska. Very incouraging reports of spring wheat prospects from Dakota and Minnesota. Very good reports of wheat and corn from Ohio. Indiana reports favorable. In Missouri, Kentucky and Tennessee, harvest will begin at least 10 days earlier than usual.

An association of wool dealers was formed at Boston the other day to keep down prices. They say union is needed against jobbers and large growers, who combine to put up prices regardless of the stocks on hand. At present prices, a sheep turning off less than five pounds of pretty good wool, is wasting money, and should go to the butcher. Foreign importations are falling off, foreign prices advancing. A lot of Australian wool in bond was sent from Boston to Liverpool the other day to be sold at the approaching great auction sale, because it was thought prices there would be better than those here after paying duty. All fear of the Morrison-Hewitt bill is over for this season. The clip here will be less than of late years; and prices should be profitable. No advance has yet been made, however; while some concessions are reported. Little doing by manufacturers in the way of stocking up yet; nor will much be done till the new clip reaches the seaboard in greater bulk. In the interior buying is only beginning to assume importance. The sales of the week in Boston were 2,602,000 pounds, against 1,065,00 pounds last week, and 2,203,000 pounds in the corresponding week last year.

At the end of last and beginning of this week a large number of Western stockmen were in this city to bid for the government contracts for the supply of beef to the Indians on the various reservations. In all sections prices were unusually low. The lowest bid a year ago on 10,000,000 pounds of beef for the Indian Territory was $3.17 per 100; this year it was $2.64. The prices for all the other reservations were proportionately low, especially those for the other great Indian country, the Sioux Reservation up in Dakota. Col. Hunter, of St. Louis, and R. M. Bosler, of Pa., think prices will be higher this Summer than last, and that the low prices of the "lettings" are not a standard of the market prices. All Western Texas has been without spring rains; there has not been grass enough to fatten cattle, and not 50 per cent. of the usual number will be driven out of this great cattle-raising section. Supply smaller, therefore, and prices higher. Only the poorest beef goes to the government lettings—that from stock that couldn't be marketed elsewhere. Russell A. Harrison, son of Senator Harrison, of Indiana, thinks the prices no indication of the market, as bids must be put in long before the market prices are made. Thinks the prices will be pretty fair, and that the contractors will be kicking themselves for having bid so low. Mr. Denman, Colo., thinks government lettings "fairly show a downward tendency of range cattle." Prices have gone down 20 per cent. in a month, and 50 per cent in three years. Formerly, out of every hundred head of cattle on the ranges 75 per cent. would be fattened there; now not over 30 per cent. can be so fattened. Extension of settlement, etc., have so changed the climate as to cause rain in the Fall and Winter and not in the Spring over most of the country from Canada to the Gulf—hence a poor grass crop in Spring, while fall rain rots the grass. The poorer quality of the beef is one reason for the downward tendency. All these men are cattle kings. Denman thinks the wish is father to the thought in case of the others who predict high prices. Prices of range cattle must affect those of others.

MARKETS BY TELEGRAPH.

SATURDAY, May 29, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 1c. lower. No. 2 Spring, ¾c. lower. Corn, ½c. lower. Oats, ⅜ c. lower. Rye, ½c. lower. Barley, steady. Pork, 17½c. lower. I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.
It has never been surpassed as an increaser of pork and general system tonic. Aiding digestion, stimulating the biliary organs, preventing torpor and engorgement of the liver, and regulating the bowels, it removes and prevents the formation of disease germs, and preserves to the well bred hog his natural constitution. Where it has been fed to such animals in the prescribed quantities, and other directions faithfully observed, it has proved a thorough preventive against swine disease.
AS AN EVIDENCE OF FAITH
In my remedy I make the following offer:
1. I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and are neither in-bred, close-bred nor the progeny of such.
1. I will forfeit $100.00 to any breeder whose offer to examine for insurance I decline, provided he forwards remittance to cover my expenses to and from location of hogs, or I fail to prove to the satisfaction of any disinterested party, that failure to respond to invitation is caused by prior engagement or by matters of at least equal importance.
2. I will forfeit $500.00 if I decline upon examination to insure such herds, if my judgment as to their condition of health is overborne by the result of an examination made by at least two properly qualified and graduated veterinary surgeons.
Facts are Better than Assertions.
Please read the following testimony:
GIBSONTON P. O., PA., Feb. 2, 1885.
Dr. Jos. Haas—Dear Sir: About a year ago our herd here numbered about 2,700 head. Disease broke out, and no remedy we had would arrest the trouble. Our losses were heavy and we had to give up feeding entirely for about two months. We then heard of your remedy and bought a trial lot, and began feeding again. We have used it constantly ever since. We have since April last received about 5,000 head of hogs into our herd and have not had a single death from swine disease. This is our experience. Our opinion is that the remedy has prevented disease, and we would not think of being without it. As an aid in fattening pork, we believe it to be good. On this point, however, we have not made an actual test, *as we would not risk feeding a pen of hogs without the Remedy.*
Yours very truly, WHITE & CO.
[N. B.—White & Co., since writing the above letter, have purchased $450 worth of the remedy.]
The remedy can be procured of all Druggists, or from my laboratory. Prices, $2.50, $1.25 and 50 cts. per package. 25 lb. cans, $12.50.

For the Young.

COW FOOLS.

It was a Jersey heifer
  Walking through a pasture small,
Met a Shorthorn cow a-feeding
  Where the grass grew sweet and tall.
Bright and pretty was the Jersey,
  Long her pedigree, and neat,
Fat and awkward was the Shorthorn,
  Like a mountain built of meat.
And the Shorthorn stopped her feeding
  As the Jersey wandered near,
"Here is grass," she said, "in pleuty;
  Let us eat together here."
But the Jersey tossed her nose up
  In the most provoking way,
And she said, "I thank you kindly,
  But I think I will not stay;
I am higher bred than you, ma'rm,
  And I think you will agree,
I should lose my social standing
  In your low society."
Then the Shorthorn snorted fiercely,
  For her pride was deeply hurt;
And she said, "A right good riddance
  When you go—you little flirt.
It is true, your golden butter
  Is a pretty thing to see,
But what else, Miss, are you good for?
  There is nothing I'll agree.
For men cannot live on butter;
  They would quickly come to grief
If fat ladies such as I am
  Didn't keep them up with beef."
So the Shorthorn and the Jersey
  Stood and argued loud and long,
Each one tried to prove the other
  Was entirely in the wrong.
Till at last they fell to fighting,
  And the Jersey's unbelief
Fell away before the pushing
  Of the Shorthorn's solid beef.
And she limped away in silence,
  Feeling very mean and small;
While the Shorthorn was so angry
  That she could not eat at all.
You will say—What foolish creatures!
  So they were—but tell me, pray,
Can we not find human beings
  Who are just such fools to-day?
There are folks who, like the Jersey,
  Feel themselves above a man
Who is slow, perhaps, and awkward,
  And must labor as he can.
There are others, like the Shorthorn,
  Who would sneer at thought of gain,
To be wrought unto a country
  By the working of a brain.
Now what trouble would be buried
  If we, all of us, could see
That it takes all sorts of people
  To make up this great country.
For the world goes on forever,
  It is very like a race;
We must all run in the contest,
  We must always find our place.
Let us view the works of others
  With a certain charity,
And believe their words are honest,
  Though we cannot all agree.

I AM getting a little frightened at the cords of words you are plowing out. I had no idea there would be so many. During the past week, lists have been received from Harry King, Geo. H. Strong, Chas. Crane, Murray Gilkison, Ella M. Turner, Fred Corless, Frank E. Halbert, Ellie Nixon, Archie Lockhart, H. M. Ross, Johnnie R. Giles, Andrew Dermott, Ray C. Jewell, Willie S. Earhart, Fred W. Park, Amy B. Powers, Warren Collins, Hattie Van Skiver, Ernest McReynolds, Fred H. Carpenter, Elbert Marshall, W. W. Washburne, Charles H. Johnson, Kittie Lamb, Willie Byram, Neal Eckerson, Frank Murphy, Frank Hawley, James W. Searson, C. W. Kruse, Charles Wallace, Frank B. Williams, George B. Baskervelt, Abram H. Prince, Annie M. Hall, Henry Croyle, Sylvesta Thompson, Bessie G. Lehman, Chas. W. Ingraham, James W. Brown, C. C. Bruce, Ralph Sawyer, W. M. Newne, and one not signed. We shall cover an acre of paper if we keep on.

Some of the Cousins have sent in lists of Latin words. These will not be accepted. We had better confine ourselves to English I think. To tell the truth, I am lost whenever I go very far out of English, and I hope none of you want to lose me yet.

I find that quite a number of our boys and girls have neither brothers nor sisters, so that they have to do all the work of hunting out the words alone. I feel sorry for them, because I know it would be very pleasant to have som body in the family to play with and to talk to. But these boys and girls who have hunted out the words all alone have done so well that I am very proud of them. The work will help them very much, for I find that the things we have to puzzle out ourselves seem to stick to the brain the longest. It pays to be able to spell well, I can tell you. Many boys that I know of have lost good situations because, when asked to write a specimen letter, they got two or three words all out of shape. Five minutes spent in looking over the dictionary would have saved them. Never be ashamed to look at the dictionary. We can talk very well without betraying our bad spelling, but when we come to write it down, there is no chance to get away from it.

I had a pleasant surprise last week. I received a box of asparagus from Annie and Lou Hall. It was the most delicious asparagus I ever tasted and you may be sure that I enjoyed it. I have never seen anything neater that the way in which this asparagus was packed. It was tied up in round bunches as firm and compact as one could wish. The light heads were clustered at the centre of each bunch with the dark green heads on the outside, so that it was really as pretty as a bouquet. Such an arrangement must add greatly to its attractiveness. It shows what neatness and taste will accomplish. I am sure that Annie and Lou are a great help to their Papa.

"Mistress Mary, quite contrary, how does your garden grow?" I used to read that old rhyme when I was a boy, and I suppose most of you have seen it a great many times. We have a great many Marys in our family, and while I hope none of them are "quite contrary," I do hope each one has a garden. So I am going to ask "how does *your* garden grow?" I hope you can all give a better answer than the Mary in the old song. I wish I could go around and look at all the gardens. I wonder if I should find any weeds; what do you think about it? I have an idea that the gardens are looking pretty well. It will pay to keep them in good shape for nobody knows when I shall come to look them over.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I received the sweet peas you sent me, and thank you very much for them. I planted them and they are just coming up. Pa received his Rural seeds. He planted the Garden Treasures and they all turned out to be tomatoes. He also planted the melons. We have potatoes up a foot high. I am going to have a very nice flower garden this Summer. The seeds are planted, but some of them are not up yet. We are going to have some splendid Chrysanthemums. They are now about three inches high. Our house plants are doing nicely. We will have a lot of fruit this year. The strawberries are in blossom. Pa has got some called the "Jewell" so highly recommended by the RURAL. I wish you and Aunt Beth could come over and help us eat them. I see by the last RURAL that you are a strong temperance man. Ma is glad to learn that you are, for she is a temperance woman: being brought up in the State of Maine, she could not otherwise be anything else. ELLA M. TURNER.

Cornwall, Ontario.

[I wish I could come and help eat the strawberries. I think Aunt Beth would accept the invitation if possible. We want all the temperance people we can find.]—U. M.

DEAR UNCLE MARK: I suppose it is about time for me to write if I wish to remain a member of the Y. H. C. I should have written long ago, but you know something of farm life. Although I have not written for a long time, I have always managed to find time to read our department. Perhaps it might not prove uninteresting to tell what vegetables and what varieties succeed best here. I will begin with beans: the general favorites are German Pod Wax, Golden Wax and Ivory Pod Wax. Peas, Ferry's First and Best American Wonder and Champion. Onions, Red Westersfield, Yellow Globe Danvers, and Southport Yellow Globe; the latter is perhaps the most satisfactory of the three. Beets, Egyptian Blood Red and Eclipse. Cabbage, Early Jersey Wakefield, for early, and Henderson's Early Summer and the Filderkrant for medium and late. Radishes, Early Round Deep Scarlet and French Breakfast. Tomatoes, Livingston's Perfection and Favorite. Squash, Hubbard, Marblehead, Essex's Hybrid. Turnips, Purple Top Strap Leaved is about the only variety raised. Summer squash, Summer Crook Neck, Little Gem. The above mentioned varieties are no untried novelties but have been fully tested and approved. Why do not some of our youthful farmers give their experience with corn? My own experience with new varieties has been somewhat limited, but I will give it for what it's worth. The earliest corn we have is the Pride of the North. It is small, and it will not pay to raise this variety in this country, where we can raise larger varieties that will yield a great deal more to the acre with the same care. Hathaway's may prove profitable. The Queen of the Prairie is the staple early corn with the farmers. Wright's Golden is the best corn I have tested. The Golden Beauty is another promising variety. Cloud's Dent is a failure. Taken altogether, Wright's Golden and the Golden Beauty are the two varieties that seem to possess any merits above the ordinary field corn. I am glad that so many of the Cousins are growing seedlings; may the good work continue. I have seedling raspberries, strawberries, blackberries and gooseberries, besides quite a number of seedling potatoes. Some of the vines I hope will fruit this year, and another day I may write to you and tell you how they perform. It is quite interesting to watch a plat of seedling potatoes. Possibly there are members like myself who are desirous of testing newer vegetables but have not the means to do so. Now then, cannot we in a measure help each other, by exchanging seeds through the mails? I am very much interested at present in testing potatoes; have grown 20 to 25 varieties and have come to the conclusion that for home or market the following eight sorts are the best I have grown. E. Sunrise, E. Gem, Chicago Market, Mammoth Pearl, O. K. Mammoth, Prolific, White Elephant, Walls Orange and Rural Blush. If any of the Cousins who are interested in potatoes, who haven't got, or desire to get one or more varieties mentioned, would care to exchange tubers of other sorts for them, I would be glad to hear from them.

Your Rural nephew,
Edinburg, Ills. FRANK LOGAN.

[A good idea that! I think we can make an exchange department that will be very profitable. Let us try it.—U. M.]

DEAR UNCLE MARK: I am a boy, 15 years old and live near Los Gatos, a little town 10 miles from San Jose, California. I would like to become one of the Cousins, and am going to try and get the plow. They raise oranges, lemons, figs, olives, almonds, apricots and a great many other fruits here. The prospect for grain was never any better that it is this year, and there is going to be a large crop of fruit. We had no snow here this Winter, but there was snow on the mountains around us. I had a pair of pigeons, but the skunks killed them. I caught the skunks in a trap but the box I caught them in was not large enough, and they got away. There are a great many gophers around here, and we have to keep traps set all the time to keep them from eating the roots off our trees. We have some corn and potatoes planted and I am going to have a quarter of the crop for cultivating them. We have seven acres of land and 700 fruit trees. I have cultivated them five times this Spring. Cherries are almost ripe and prune trees are loaded with green fruit. We have 30 hens and about 40 chickens. FRED CORLESS.

[You are far away from headquarters, but our family is large enough to include you. I am sorry the skunks got away. They deserved death. Wouldn't some of the Cousins laugh to see those gophers sitting at the entrance to the hole? They are bright little fellows, but they do lots of mischief.—U. M.]

DEAR UNCLE MARK: Thanks for the nice package of Canna seeds I received. I will try and make them grow. Mamma and I are very fond of flowers and plants and pets. We have eight little lambs and 22 young chickens. I guess their toes are cold, but we try to take care of them. We have a nice home, lots of fowls and cattle, horses, etc. Would like to have some of the little Cousins write me a letter. I am nine years old. I am piecing a quilt and making a scrap book.

Your loving niece, RETTA M. AVERY.
Lebanon, Laclede Co., Mo.

DEAR UNCLE MARK: My father has taken the RURAL for two years, and I always read the letters from the Cousins, so I thought I would write to see if I might become one of them. I raised some peas last year and the year before, and they did well for the care they got, but next year I am going to raise some more and take better care of them. My father is a fruit man, has 250 plum trees, 50 of which are in bearing condition, six acres of grapes, 3,000 peach trees in bearing condition, 250 pear trees, two or three acres of apple trees, and about 12 acres of gooseberries, currants, red and black raspberries, and strawberries and blackberries. I have a cow, a pair of rabbits and 12 hens. I wonder if any of the Cousins have any rabbits. I must close.

Your nephew, AUSTIN ESTABROOK.
Grafton, Mass.

DEAR UNCLE MARK:—I have often read the letters your nephews and nieces have written, and thought I would write one. I would like to join the Club, too. Papa is a farmer in Dakota. He spends his Summer and Fall there and the Winter at home. I have two brothers out there and one at home. I have no sisters. I am next to the eldest. Papa owns 800 acres of land in Dakota, 160 in Nebraska and a large drug store here, which Mamma runs while Papa is away. Shortly before Papa left he gave me a very handsome piano. It is an Upright. Our school will be out in three weeks, and then I will receive a diploma, so that I can go to the High School. Last year there were five diplomas, and this year there will be nine, if not more.

Your affectionate niece, EDA SEYMOUR.
Dwight, Ill.

Miscellaneous Advertising

A LIBERAL OFFER.

Five Thousand Dollars to any Charitable Institution,

If It Cannot be Done as It is Stated.

Rochester, N. Y., Union and Advertiser.

Friends of Ex-President Arthur are very much disquieted.

Of course he is not going to die! He is in the hands of a very particular physician.

His doctor does not call it Bright's Disease! No, it is stomach disorder that he is suffering from now, and every few hours he takes a cold, and from time to time many other symptoms are developed. These symptoms the public should know are really secondary to Bright's Disease.

His physicians say that everything that medical skill can do for him is being done.

This is not so!

This case is a prominent one because the general is an ex-president; and yet there are thousands of farmers quietly dying in their farm houses of secondary symptoms of Bright's Disease, called by every other conceivable name; thousands of workmen, likewise dying, leaving helpless families; hundreds of thousands in all walks of life who have sickened, and are likewise dying, helpless victims of powerless physicians.

Eight years ago a very well-known gentleman was about to enter upon large commercial transactions. His medical adviser quietly dropped into his office one day and told his confidential clerk that he would be dead in three months, and that he ought to settle up his business affairs at once!

That man is alive and well to-day, yet he was given up as incurable with the same disease that is killing General Arthur!

Our reporter met this gentleman yesterday and in conversation about the General's case, he said:

"I will give $5,000 to any charitable institution in the state of New York, to be designated by the editor of the New York *World*, the editor of the Buffalo *News* and W. E. Kisselburgh of the Troy *Times*, if Warner's safe cure (taken according to my directions) which cured me eight years ago, cannot cure General Chester A. Arthur of Bright's disease from which he is suffering."

"Now I want you to understand," he said, "that we do not profess to make new kidneys, but we do know from personal experience and from the experience of many thousands of similar cases, that we can stop the consumption of the kidneys. Many a man has gone through life with one kidney without inconvenience. Thousands of people have lived a majority of their life with one lung. They did not have a new lung made. We do not make new kidneys, but if the kidney is not consumed too much we can stop disease and prolong life if taken in time."

This offer comes from H. H. Warner proprietor of Warner's safe cure, of this city.

Mr. Warner also said, "My dear sir, there are governors, senators, presidential candidates, members of congress, prominent men and women all over the country whom I personally know have been cured of disease, such as General Arthur suffers from, by our Warner's safe cure, but owing to the circles in which they move they do not care to give public testimonial to the fact."

Mr. Warner is interested in General Arthur's case because he is personally acquainted with him and he says that it is a shame that any man should be allowed to die under the operation of old-fashioned powerful cathartics, which have no curative effects, rather than that a modern, conceded specific for kidney disease whose worth is acknowledged world-wide, should save him.

"If you doubt the efficacy of Warner's safe cure," say the proprietors, "ask your friends and neighbors about it. This is asking but little. They can tell you all you want to know."

"We have kept a standing offer before the public for four years," says Mr. Warner, "that we will give $5,000 to any person who can successfully dispute the genuineness, so far as we know, of the testimonials we publish, and none have done it."

Were General Arthur a poor man unable to be left "in the hands of his physician," he would use that great remedy, as many thousands of others have done, and get well. How absurd then for people to say that everything that can be done is being done for the ex-President, when the one successful remedy in the world that has cured, or that can cure a case like his, has not been used by them.

SHORTHAND Writing *thoroughly taught* by mail or personally. Situations procured all pupils when competent. Send for circular. W. C. CHAFFEE, Oswego, N. Y.

PERSONALS.

PROF. LEOPOLD VON RANKE, the celebrated historian, died at Berlin, last Saturday, May 22, aged 91.

IT is reported that the betrothal of Princess Louise, eldest daughter of the Prince of Wales, to Prince Oscar, son of the King of Sweden, will be soon officially declared.

DAVID DAVIS is slowly recovering from his illness, although he is still a great sufferer from the tremendous carbuncle on his left side. His physicians now say he will recover.

GEN. F. E. SPINNER, ex-Treasurer of the United States, is ill in his tent on the beach near Jacksonville, Fla., where he has been camping out; threatened with pneumonia at the age of 85.

COLONEL TOM OCHILTREE, the red-headed shrewd, Texas blatherskite, thinks Texas ought to erect a monument to Jay Gould for developing the railway system in the Southwest.

CONGRESSMAN DAVENPORT, of New York, one of the richest bachelors in the House and the late Republican candidate for Governor against Governor Hill, is to be married in a short time.

COUNT HERBERT VON BISMARCK'S elevation to the dignity of Foreign Secretary will net him a snug little salary of 50,000 marks ($12,500), only 4,000 ($1,000) marks less than his father's official income.

JOHANN STRAUSS, the composer, frankly declares that he embraced Protestantism because the Catholic canons forbade his marrying a third time while his divorced wives are living, as he desired, and as Austrian law is similarly severe, he has for the same reason been naturalized as a German citizen.

LORD WOLSELEY, who has been talking of throwing up his commission and joining the threatened insurrection in Ulster, has no part or lot with Ulstermen. His branch of the Wolseley family has been settled in County Carlow ever since, just after Boyne Water, it broke away from the parent stock in Staffordshire.

"UNCLE" PHIL. ARMOUR is believed to be the heaviest loser by the recent great decline in wheat. He began to bull the market at 97 or thereabouts, and dropped his load at 80 or below. His loss is put at seven figures by some of the big operators, who think he dropped about as much as he made last year in speculating in St. Paul and Northwestern R. R. stock.

IT was $21,500, cash, not $25,000, the President paid for "Rosedale," about two miles from Washington. Deed of transfer recorded Thursday. The place "commands one of the prettiest views in the neighborhood of Washington." Known as "Pretty Prospect" as long ago as 1794; contains 28 acres. After some repairs to the homestead the President will occupy it—during the Summer at least—and be at the White House only to transact business.

GEN. DURBIN WARD, Democrat, was appointed one of the trustees of the Ohio Soldiers' Home the other day by Republican Governor Foraker, as a mark of high appreciation of his excellence as a citizen and a soldier. He died a few days later, on Saturday, May 22. Born in Kentucky February 11, 1819; moved to Ind. in 1823; studied law; joined the volunteers at the very outbreak of the war, and distinguished himself greatly in a number of battles, especially at Chicamanga, where he was wounded. Made Brev. Brigadier-General for services there.

MISS FOLSOM and her mother, or rather Mrs. Folsom and her daughter, arrived here at 9.30 Thursday night on the Red Star steamer Noordland from Antwerp. Col. Dan. Lamont, the President's private secretary and chum, met the party on the revenue cutter Chandler, and brought the mother, daughter and uncle, with lots of baggage, to this city, where he and Miss Rose Cleveland had engaged rooms for them in a fashionable uptown boarding house. Frankie's grandfather died after they had embarked, so they knew nothing of it. The President will be here tomorrow evening to attend Decoration Day, Monday. He will stay at Sec. Whitney's, close to the Folsom boarding-house.

MONDAY the body of Dr. Dio Lewis, who died here the previous Friday, was quietly cremated, according to his directions. Though enthusiastic to the verge of crankiness in some things, no doubt he did much good, especially in causing more attention to the physical development of girls. Born in Auburn, N. Y., in 1823; began medical practice there in 1845; practiced in Buffalo from 1847 to 1852, having become a homœopath. Soon became a foe to all schools of medicine, and began lecturing on hygiene, and devised a new system of gymnastics. Settled in Boston in 1860. Removed to New York in 1883.

Miscellaneous Advertising.

LADIES WHO SUFFER, as only themselves know, are now beginning to know that a congested condition of the system, if not removed causes the chronic complaints from which they so much suffer; this congestion occurs most frequently in the kidneys, liver and other abdominal organs, and it can readily be removed by that wonderful preparation, Warner's safe cure.

BROWN LEGHORNS.

This variety has been bred by me for over ten yea with great care.
Eggs from May 1st at $2 per dozen.

Blind Drunk.

CLEVELAND, O., Oct. 30, 1885.—A few years ago, I suffered intensely from uric acid poisoning. Would become totally blind and stagger. My friends repeatedly thought I was drunk. Took twelve bottles of Warner's safe cure and am well.—GEORGE F. RIDGEWAY, ex-Deputy Sheriff, 98 Murison Street.

Just published, 12 articles on PRACTICAL POULTRY RAISING, by FANNY FIELD. Tells how she cleared $449 on 100 Light Brahmas in one year; how she clears $1,600 annually on a 60 acre poultry-farm; about a mechanic's wife who clears $300 annually on a village lot; about incubators, brooders, spring chickens and capons. Price 25c. Stamps taken. R. B. MITCHELL, 69 Dearborn St., Chicago.

SOLID COMFORT

TONGUELESS. THE "WONDER ON WHEELS"
Self Guiding. Uses a wheel landside. Two horses instead of three. A ten year old boy instead of a plowman. No pole (except among stumps). No side draft. No neck weight. No lifting at corners. Humorous.

"I SAY, papa, heard the news?" "No, my boy. What is it?" "Why, they aren't goin' to have the lamp-posts any longer!" "I am surprised! What is the reason?" "Why, they're long enough now."

A SCHOOL board recently asked the following question of a little girl: "What is the plural of man." "Men." "Very well; and what is the plural of child?" "Twins," immediately replied the little girl.

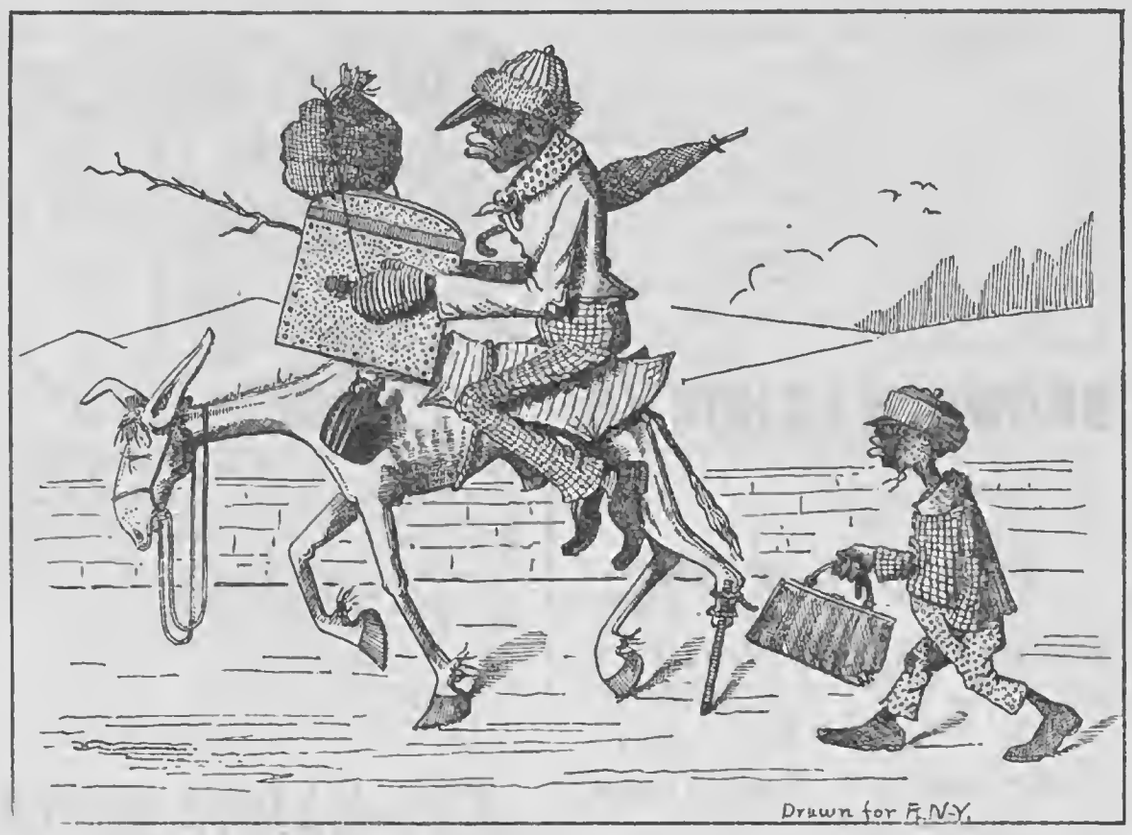
AT a book sale a copy of Dew's "Essay on Souls" was knocked down to a shoemaker, who to the great amusement of the assembly, innocently asked the auctioneer if he had any more books on shoemaking to sell.

SHE: "Ephlum, what makes so many cattails grow in dis heah pon'?" He: "Well, I should say! Doan you know? Why, dey grows up from kittens dat people has drowned in de pon', of course. Pea's like you wimmen folks doan know nuffin' about aglicultshah."

"WHAT is the meaning of a backbiter?" said a reverend gentleman during an examination at a parochial school. This was a puzzle. It went down the class till it came to a simple little urchin, who said, "P'r'aps it be a flea."

"BIDDY," said a lady to her servant, "I wish you would step over and see how old Mrs. Jones is this morning." In a few minutes Biddy returned with the information that Mrs. Jones was seventy-two years, seven months and twenty-eight days old.

UPON her first attendance at Sunday-school, a little girl three years of age was given the verse to recite, "Blessed are the peacemakers." When she returned home, her mother inquired what her verse was. She answered, "Blessed are the dressmakers' pieces."



"Say, you, 'Lijah! Ef dat mewel done know I drap dem lines he mought take et in he's foolish head ter run away wiv me. You jes better go 'n take him by de head, chile."

CORNELL UNIVERSITY.
AGRICULTURAL DEPARTMENT
In the year 1886-87 courses of instruction will be given as follows:
In Agricultural and Applied Chemistry; Professors CALDWELL, SCHAEFFER and NEWBERRY: 8 Courses.
In Botany, Horticulture and Arboriculture; Professors PRENTISS and DUDLEY; 14 Courses.
In Entomology and General Invertebrate Zoology; Professor COMSTOCK; 7 Courses.
In Geology; Professor H. S. WILLIAMS: 3 Courses.
In Veterinary Science; Professor LAW: 3 Courses.
In Applied Agriculture; Professor ROBERTS: 6 Courses.
During the present year a course of lectures is given on the Management of the Dairy by the Honorable L. B. Arnold: a similar course may be expected next year.
A veterinarian building is to be erected in the course of the present year, and four rooms are to be added to the Agricultural Laboratory and Museum.
The University Farm contains 257 acres, of which about 125 acres are in tillage. The farm contains two very large barns, a dairy house, and an excellent herd of stock. All the appliances of the Farm are used chiefly for the purposes of illustrative and experimental husbandry.
Students who take the full course and pass the requisite examinations receive the degree of Bachelor of Science in Agriculture.
Students not candidates for a degree are received without examination as "Special Students" and are admitted to any or all of the above courses, provided the applicants are 18 or more years of age; and provided they satisfy the Professors of Agriculture of their disposition and ability to profit by the instruction.
The next collegiate year begins September 14, 1886!
To all students of Agriculture "TUITION IS FREE."
Full information sent on application. Questions concerning courses of study should be addressed to I. P. ROBERTS, Professor of Agriculture; all other questions to E. L. WILLIAMS, TREASURER, CORNELL UNIVERSITY, Ithaca, N. Y., May, 1886.

VOL. XLV. No. 1898. NEW YORK, JUNE 12, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Horseman.

NORMAN MARES.

IN Fig. 245 we show a group of Norman bred mares with foals. These animals are owned by Messrs. Dillon Bros., Normal, Ill. Our artist has succeeded in making an admirable picture. The mares are just coming from the feeding barn, and slowly walking back to the pasture. The grouping is strikingly life-like and effective. Messrs. Dillon Bros. have now a herd of 186 horses at Normal. Besides the work of breeding pure-breds, they have engaged largely in range work in Texas, where they have some 4,000 horses, and breed 2,500 mares with a result that is said to be highly satisfactory. They have a large number of young pure-bred horses of their own breeding. These are considered far more valuable for breeding purposes than the imported animals, as they are more easily kept and less liable to disease than horses that have never been acclimated. The two fine stallions, Rio Grande and Extractor, are at the head of the herd. Extractor is sired by Favora, the winner of the medal at the Universal Exposition at Paris in 1878. No breed has done more for the improvement of American draft horses than has been done by the importation of this famous breed of French horses, whether known here as Normans, Percherons, Norman-Percherons or Percheron-Normans.

SHOELESS HORSES.

I ALWAYS wonder when I read the articles about shoeless horses whether the persons who write them really know anything about the matter. It is not true that a horse can go on ice without shoes without slipping. I had a mare which was never shod, and after she had bred 11 colts she was used some on the farm. One day she was put in to draw wood, and an attempt was made to drive her across a strip of ice. She could not stand up, and after slipping terribly, fell down and could not get up. She would have died there if she had not been drawn to the shore by putting a rope around her breast to which the other horse was hitched. This mare could not go on an icy road. Her hoofs had never been touched by a rasp or buttress, or anything else. They were as nature made them. Another thing—no horse can travel on a pike or a gravelly road for any length of time without wearing the hoofs down so much that the feet will become tender, and if kept up the animal will become lame and useless. Colts often get foot-sore in this way, running in the fields and stamping flies, which wears away the hoof. It wears off faster than it grows out. It is not the shoes which injure the horses, but the way they are put on. A shoe should be fitted to the foot of the horse, but quite often the rule is the other way, and the hoof is cut down and rasped off to fit the shoe. Shoes are too short or too narrow, and on this account the weight is not placed under the outside or shell of the foot, where it should be. I saw a whole stable of horses of great value at Cedar Rapids, Mich., which were all getting lame, because they were shod so very nicely by a man who was a "neat workman." This over-nice blacksmith had kept cutting away the heels and frogs so that each horse had become tender-footed, and oils had been applied to the hoofs to soften them. All the horses wanted were hoofs. Farmers make corns in their horses' feet very often by allowing the shoes to remain on too long, or until the foot grows to the outside of them, bringing the weight of the body right on the sole. This kind of economy and carelessness should never be practiced. It often spoils good horses.

F. D. C.

Rural Notes.

GRANT that by early sowing, transplanting and careful hot-bed nursing, ripe tomatoes may be secured 10 days earlier than by sowing the seed early in the open ground, the stubborn fact remains, that if we count the time required for the plants to grow from the seed to the first ripe fruit, we shall find it decidedly shorter in the plants grown in the open ground, account for it how we may. For the past two seasons I have grown so large a number of crossed seedlings of the tomato that I could not afford them hot-bed room. Both seasons I have been surprised at the early maturity of their fruit, as well as by the fact that the young plants were not injured by late spring frosts. Whoever knew a tomato plant that came up from self-sown seed to be injured by frost in Spring? I venture the guess that if we were to do away with hot-beds we should have before many generations tomatoes that would ripen their fruit as early as, and be far more hardy than, our hot-bed plants.

* * *

GROUP OF NORMAN MARES. Fig. 245.

A few weeks ago I stated that the prospect that we shall ever be able to grow the cabbage from leaf cuttings appeared very discouraging. It now looks brighter. Several cuttings made in March rooted and formed strong buds in less than 20 days. The buds developed very rapidly into thrifty plants, far surpassing those grown from seed. Although not of an early variety, these plants are now more advanced than any others that we have. In this case the slips were taken from the stem leaves of a plant that was forming the flower-stalk. We find that leaves from a plant that is in a condition of growth at the time the slips are taken, form the bud much sooner than from a dormant one. What are the advantages of growing the cabbage from cuttings? it may be asked. We should be able to keep a valuable strain with greater certainty than we can now do. The grower would be able to select his own heads and secure a crop from them the next season, without the necessity of waiting a whole year to raise his seed. The danger of cross-fertilization would be removed, etc. It is evident that we must be able to utilize the whole head for slips, before this method of propagation can be made practical to the market gardener. I think there is some hope that we may yet be able to do this.

* * *

All are familiar with the common garden sage, and most of us with that beautiful flowering plant, the Scarlet Salvia, which is a member of the same family. Besides the latter, we have grown two other plants of this family, that have been much admired by the curious. One is the Silver-leafed Sage, (Salvia argentea) which is conspicuous in the garden, from its very large, whitish, downy leaves, which lie almost flat upon the ground. These are often eight or ten inches in length when full-grown, and are among the first to appear it Spring, coming up almost as early as those of the rhubarb. They are covered on the upper surface with a long, white down, which gives them a striking appearance. I think this plant might be used with good effect for a perennial border in the background. It is readily grown from seeds.

* * *

The other plant is the Purple Sage, (Salvia horminum) and is interesting from the fact that the leaves of the floral stem are of a bright purple. The lower leaves are not strikingly different from those of the common sage, but at the time of blooming the highly colored stem leaves give the plant a very attractive appearance. There is a variety in which the stem leaves are pink.

* * *

The past Winter the plants of Early Harvest, Brunton's Early and Crystal White Blackberries were frozen down to the snow line. Ten other varieties remained uninjured. The raspberries came through all right, but young peach trees suffered a terrible mortality, nearly all being destroyed. Apricots and nectarines fared a little better, but were badly injured. E. S. GOFF.

Geneva, N. Y.

Farm Topics.

CORRESPONDENTS' VIEWS.

No amount of talk could induce me to have a farm horse shod except for work on icy roads. In my experience, unshod horses on the farm are much better off. It seems to me that most of those who advocate horse shoeing see nothing but heavy cart horses walking over stone pavements. We do not want the largest horses for our work; animals from 1,100 to 1,300 will do. All the larger horses can be sold to much better advantage for work in the pine woods, or for draught horses in the cities. We never think of keeping these great elephants for our own use. If the broncho could only get rid of his temper and ugliness he would make a good foundation for the farm horse, as he is as tough as a whip. His temper bars him out. It will be hard to beat the Cleveland Bay. Of the large horses I do not want more than one-fourth pure blood. D. W. D.

Des Moines Co., Iowa.

My man and I have put up eight miles of wire fence this Spring. We can make the holes and drive 250 posts per day over these flint hills. I took a tumbling rod of an old thrasher, and had the blacksmith cut 5½ feet off and weld a piece of steel six inches long at each end. One end was drawn out to a point and the other left flat. To make the holes, drive the pointed end into the ground and then work the top around. To unreel the wire we take two poles 10 feet long, strong enough to bear up 200 pounds each. Four inches from the end two good-sized holes are bored. Pins are put in these placed over hind bolster of wagon, under bed. Two feet from these holes two others are bored to pin on a cross-bar that shall hold the poles the right distance apart to enable two spools to roll easily between them. Two feet further back 10 more holes are to hold pins six inches long. Two spools of wire are placed on the post bar so that the wire will unwind from the underside of the spools, and put in front of the last set of pins. The spool nearest the fence is fastened for the top wire and the other for the lower wire. With a wide-tired wagon three spools can be used at one time. In this way the team is made to do work that would otherwise call for much hard hand labor. W. L. B. N.

Chase Co., Kans.

My experience on a poor farm teaches me that sheep and clover are the best agents to put at work. In the East I would add poultry and fertilizers. I can't say too much in favor of Red Clover as a natural fertilizer. It makes the best hay for cattle and sheep and the best of pasture, it improves the land and you can plow under the second crop and thus get the cheapest and best of manure. I don't see any sense in this talk about poor soil at the East. Fertilizers are cheap enough to enable any farmer to get a good catch of clover on the poorest soil. Let me get a good stand of clover and I can make over any soil.

Andrews Co., Mo. E. J. B.

I sowed two bushels of Welcome Oats. They thrashed out, with the machine, 125 bushels. One bushel weighed 44 pounds, making, by weight, 171 bushels and 28 pounds. The straw was from five to six feet high. I measured some heads that were 24 inches long and counted 209 grains on one head and 72 straws from one stool. The Welcome beats all the oats I have ever tried. M. V. C.

Manton, Mich.

You have given the "tree peddler" fits. I found that out when I was in the business. It never hurt me in the end, as it taught me to study my work and make no promises that I could not fulfill. Man can often tell what he can do himself, but it is hard to go bonds for a tree that somebody else is going to handle. S. P. G.

West Luna, Wis.

In putting down fertilizers at the South we use a "horn," which is very convenient. By its means fertilizers can be put down on windy days as well as when the wind is quiet. This tool can be made by any tinner. It is like a funnel with pipe about three feet long. The top of funnel should be about eight inches wide, and the pipe about two inches. A darkie will put down guano, with this tool, as fast as he can walk, by putting a strap to an old guano sack, half turned, and putting the strap across his right shoulder, letting the sack hang by his left side. The horn is held in the left hand, and the right hand is used for the guano, which is slowly dropped into the horn as it is carried along the furrow. When the hand is nearly empty, the horn, must be thrown forward, so as to get another handful and not be compelled to stop. I. G. S.

Barnsville, Ga.

There is still money in sheep-raising, and there will be more before there is less. Sheep are the best farm stock for farms like ours; they never tear down fences or stables, or root up gates, but they mind their own business. We use the Cotswold. We want a sheep that will give us both wool and mutton. It is cheaper for us to eat mutton and sell pork. The wool from a small flock will nearly keep us in groceries. Every farmer on bushy or grub land ought to have a flock of sheep by all means. We have our lambs come the latter part of March. The sheep are fed through the Winter on clover and Timothy hay, roots and a little grain. After the lambs come we give ground feed. If a lamb is chilled we never take it away from the sheep if we can help it, for it is hard to make her own it again. As we make sheep raising only a part of our farm work, we don't have the time to fool with lambs much. We generally put the sheep and lamb in the warmest corner of the barn and heat a block of wood and put it beside the lamb. We can generally get them through all right. E. K. S.

Delhi Co., Iowa.

I find the raising of Angora goats very profitable in this part of the country. They are tougher and hardier than any breed of sheep I have ever handled. I winter my goats in a cellar under the barn where the manure is deposited. The steam from the manure piles would kill sheep, but the goats do well, and don't appear to mind it. Salt hay and oat straw formed their feed for the Winter, and they did well. I think they prefer coarse fodder, flags and brakes, to good hay. In the Summer they are to be found among the sweet ferns and bushes, instead of the good feed in the pastures. They clip about the same amount in mohair that sheep do in wool, but the mohair is worth from two to three times as much per pound. A simple fetter on their legs restrains them as it does sheep. There is a great call for breeding stock from all over the country, and at prices several times greater than those given for sheep. We can sell our mohair to a mill close at hand. There is not enough of it raised in the whole country to supply this one mill. The ewes are twin-bearers as a rule. The goats are very docile and like to be petted. If allowed to ramble in late Fall or Winter, upon a change of weather they will be sure to return to their head-quarters. They will stand exposure as well as sheep. They can be bred in New England just as easily as sheep can, and with much greater profit.

New London Co., Conn. J. A. B.

Tree peddlers are swarming all through this region and telling all sorts of stories in order to sell their goods. An honest tree man has a hard time in trying to keep up with these nimble-tongued fellows. J. S. H.

Houston Co., Minn.

Cut-worms have been very troublesome this Spring. They will cut off tomato plants about as fast as I can set them out. About the only way I have found to keep them in check is to put paper around the plants. Any common newspaper will do it. They say salt will drive them out, but it doesn't work with me, though perhaps sulphur would do it. Potato bugs are unusually plenty. It would be a great boon if the hens would eat these bugs, but they don't do it, at least my hens won't. I am inclined to think turkeys or ducks would. Toads are the best friends of the potato grower. The time may come when we will have to make a business of raising toads to protect our potatoes. W. H. B.

Salem Co., N. J.

FARM NOTES.

Whatever the theorists or politicians may say about bogus butter, the fact remains that in our market, it is much easier to sell good butter than it was before the discussion became so warm. We can sell all the butter we can make at a fair price, and the more bogus butter there is on the market, the closer our customers appear to stick. I do not see that the bogus article can ever be made popular, and but little of it would be bought, except by the poorer classes, if it was not disguised as butter. Our customers tell us that they prefer to pay a few cents extra for the sake of knowing where their butter comes from. They will economize in almost anything else before they will eat oleomargarine. It will not pay us to sell to any other class of customers. Unless something is done to regulate the sale of oleomargarine, there is sure to be a great increase in the number of family cows kept near the towns and cities. Good thoroughbred or grade Jerseys will be in good demand. The fact is that what we call profitable customers will not eat oleomargarine, and they will go to any reasonable expense or trouble to avoid it.

Near slaughter-houses and soap factories, farmers can make small fortunes at duck raising. A duck is as great a scavenger as a hog. Ducks will thrive well on offal and slaughter-house refuse. It is an all too common practice to drag the carcass of a horse into the yard, cut it up and let the ducks feed at it. A few weeks feeding on grain is supposed to "sweeten" the flesh and take away the peculiar "meaty" taste. Small wonder that farmers who depend mainly upon grain for duck feed cannot compete in price with the large yards. These slaughter-fed ducks should come into the same regard as slaughter-fed hogs and "bull butter."

Farmers, as a rule, do not like to feed grain in Summer to the cows, and yet, where there is any market for butter and milk, it will pay. Scientists tell us that good green clover is a "complete ration." Not one farmer in 100, as nearly as I can see, ever pastures his cows on green clover or any other grass that has anything like a "complete ration." Most of our pastures are full of grasses that the cattle would hardly touch if made into hay. With such feed we need grain to help out the ration. Soiling is not half as popular as it should be. Many farmers have tried feeding very green corn and made a bad failure of it, as the stalks were soft and without any substance, and only gave the cows the scours. A good field of rye or oats will give much better satisfaction than an equal area of immature corn stalks. Truck farmers make the most of soiling when they feed the stalks of sweet corn after the ears have been removed. The stalks then are in good condition for feeding.

The common idea that extra feeding of grass or good clover hay increases the milk flow, but that it needs an extra feed of grain to show an increase in butter, is a sound one. We have proved it to our complete satisfaction in practical work, and I notice that many careful tests conducted at experiment stations show the same thing. It may be safely put down by dairy farmers that if they want more butter they must feed grain for it. Scientific experiments also appear to corroborate the common farm dictum that "bran makes milk, and meal makes butter." Many farmers who would be hopelessly lost among "carbohydrates" or "albuminoides" can give the scientists a lesson in the feeding values of grains and grasses. The fact is that no two cows are just alike, and that while general rules for feeding can be laid down at a distance, one must come where the cattle are and see and study them in order to get the best out of them. WORKMAN.

Floricultural.

RECENT ROSES UNPROFESSIONALLY CONSIDERED.

We have suffered from a surfeit of new roses of late, due no doubt to the extraordinary "boom" in these plants during the last three or four years. Of course, roses always have been, and always will be, the favorite flower, both with florists and amateurs, but they have never been so prominent as they are now. The ever-favorite Jacqueminot certainly did not receive such an ovation when it made its debut, as did

The William Francis Bennet, much advertised its first season as the $5,000 rose. The large sum paid by Mr. Evans for this stock caused much comment at the time, being apparently unparalleled in rose culture. Looking at the subsequent success of the rose, it may be regarded as a prudent investment. The Bennet is certainly a charming rose in every respect; its velvety crimson is richness in itself, and the long petals make it a peculiarly graceful bud. It is, however, at its best when half-opened. If the plant is at all sickly, it is apt to be most aggravatingly semi-double; but well-grown, it is all that can be desired in its class. The success of the Bennet recalls the high hopes raised a few years since by

Andre Schwartz, much heralded as the "Tea Jack." The lithographs of it were charming—such shapely flowers of such glowing hue—but when I persuaded it to bloom, it displayed a tiny flower, in color a cross between dingy ecru and dirty pink. Perhaps I had failed to gain its confidence, but it declined to retrieve its lost character in any way, so I relegated it to the horticultural shades, with a feeling of deep but silent disgust.

American Beauty followed the Bennet as a horticultural sensation. Perhaps it was a spirit of international emulation, but our native belle seemed determined to follow the English flower's successes very closely. The original holders of it wove a very graceful little mystery about its production, but we know now that it was raised from seed by a famous amateur rosarian, who gave the original stock to its Washington holders. The Beauty possesses one great advantage—the perfume is simply delicious. But the shape of the flower is not particularly graceful, being rather of the pickling cabbage style, and the color is a very ordinary, every-day rose-pink. We can scarcely say that it has been tested yet, and if, as claimed, it flowers outside late in the season when other hybrids are over, it will doubtless be of value to the florist. It is also expected to bloom under glass much earlier than others of its class, so here again it possesses a great advantage. Without these qualities it would be merely an every-day hybrid, though its delicious fragrance must ever be a distinguishing trait.

Her Majesty, the most recent sensation among hybrids, in point of size must certainly bear the palm. It is a cross between Mabel Morrison and Tea-scented Canary. The color is light rose, almost identical with Baroness Rothschild. Unfortunately, it is almost, if not quite scentless, and this together with its size and color, reminds us of the great pæonies beloved of our grandmothers. It recalls the prize strawberries we see, immense in size and glowing in color, but forcibly reminding us of a turnip as far as flavor is concerned. The first of these roses viewed by the writer was 19½ inches in circumference, but it had a distinctly careworn aspect, having been open for 11 days. Later specimens confirmed the first impressions. It is a great rose as far as size and vigor are concerned, but its want of fragrance will always be a disappointment, since that property is a special charm we always look for in this flower. We have two new whites to admire:

Merville de Lyon and the Bride.—The first is a magnificent hybrid of the Mabel Morrison type and may be described as like the Morrison, only more so; it is much fuller and larger. The Bride shows the graceful shape and vigorous constitution of its parent, Catherine Mermet. It has the size of Cornelia Cook without its tendency to

a greenish tinge, and shows as much delicacy as the Niphetos, without being so readily bruised. It is undoubtedly the best white Tea we possess.

Wm. Paul & Sons, the great rose growers at Waltham Cross, Herts, offer four new hybrid perpetuals for the season of 1886. Two of them, Florence Paul and Brilliant, are vivid red; Charles Dickens bright pink, and Inigo Jones dark rose tinged with purple. They are all said to be hardy garden roses. Whether they would be a success here we cannot say.

As one great horticulturist recently remarked, we are getting almost too many new roses, but so long as the demand continues, they will doubtless be produced, and improvements on existing varieties must always find a ready market, both in this country and in Europe.

E. L. TAPLIN.

Pomological.

C. M. HOVEY AND POMOLOGICAL NOMENCLATURE.

T. T. LYON.

I MAY be permitted to state that the "Rules for Naming and Exhibiting Fruits," respecting the application of which this discussion has arisen, were framed by a committee consisting of T. T. Lyon, of Michigan, C. M. Hovey, of Massachusetts; J. J. Thomas, of New York; Jno. A. Warder, of Ohio: and P. J. Berckmans, of Georgia. It having been found impracticable to secure a meeting of the committee, a preliminary draft of such rules was made by the chairman, and a copy sent to each member for criticisms and suggestions, and the same course was pursued with the final draft, which received the concurrence and indorsement of every member of the committee, Mr. Hovey included.

In order that the character of Mr. Hovey's strictures may be the more perfectly comprehended. I quote rules 1st, 2nd and 3rd, of Section 1st, to which this controversy pertains.

Rule 1.—The originator or introducer (in the order named,) has prior right to bestow a name upon a new or unnamed fruit.

Rule 2.—The Society reserves the right, in case of long, inappropriate or otherwise objectionable names, to shorten, modify, or wholly change the same, when they shall occur in its discussions or report, and also to recommend such changes for general adoption.

Rule 3.—The names of fruits should preferably, express, as far as practicable by a single word, the characteristics of the variety, the name of the originator, or the place of its origin. Under no ordinary circumstances should more than a single word be employed.

With these rules as our guide, if our refusal to indorse the objectionable names constitutes "boycotting," then is the American Pomological Society, of which Mr. Hovey is an honored official member the boycotter; and that, too, under the rules originated and reported with his personal approval.

Mr. Hovey charges a wholesale change of the names of fruits by the American Pomological Society, to which I will only reply by a denial that, in any case within my knowledge, this has been done. The nearest approach to this, so far as I have discovered, is on the part of the Committee of Revision, in such cases as American Golden Russet Apple and Fondante d' Autonme Pear, in which names heretofore, by many, at least, considered as synonyms, are made to do duty as the standard or leading names. All other cases, so far as I have observed, consist in omitting redundant or now meaningless words. Even this, so far as I have observed, is done with the utmost care to avoid any possible ambiguity or uncertainty as to the identity of the variety intended.

The American Pomological Society is largely a delegated body, and represents the great body of American pomologists, quite as perfectly as Congress represents the mass of our people. Hence its right to frame rules for our guidance in pomological matters, and I fancy that the person who may have a new and valuable fruit to offer to the public, will be very likely to feel a difference amounting to a good many "figs," between the approval and the disapproval of a society so constituted, with reason and propriety on its side. In all this, it must not be supposed that I assume to speak for the society, other than as one of its members, bound by its rules.

Mr. Hovey further remarks, in speaking of names of fruits—"There is no objection to nicknames, and nurserymen and cultivators, who have no time to write them in full, could abbreviate as much as they please." I observe, however, that thoughtful parents very generally avoid such names for their progeny as naturally suggest nicknames, preferring to avoid them if possible; while in pomology there are higher and far more important reasons for avoiding the using, and the consequent necessity for learning as well as for recording, an increased multiplicity of synonyms.

While volubility and prolixity seem to be characteristic features of French character, as well as of French nomenclature, the American thinks and talks far more tersely; and, as a natural consequence, prefers a terse, yet significant nomenclature

Van Buren Co., Michigan.

THE FIGUE AND DOYENNE D' ALENCON PEARS.

I HAVE grown both the Figue d' Alencon and Doyenné d' Alencon for a score or more of years. The trees having been procured of Ellwanger & Barry, of Rochester, N. Y., I have no doubt they are true to name. I think with Mr. Hovey, page 284, "there is evidently some mistake" with regard to the cut there referred to, but I think he is also mistaken in his conclusion that the Doyenné d' Alencon is the one illustrated. The illustration looks as though a good specimen of Princes' St. Germain had sat for its portrait in both form and shape of fruit and stem. The Figue d' Alencon resembles a fig in shape, with a short, thick stem, less than half an inch long, if my memory serves me. The skin of this pear is brown or brownish green. Of its quality I can only say that I have never had any that reached a condition fit to eat. If I attempt to keep them till that time they generally find their way to the pigs or cows; otherwise they reach the same destination earlier or are sold for cooking. On the whole, neither variety with me is worth cumbering the ground.

At times the Doyenné d' Alencon has come up so good that I felt encouraged to grow it, but it is so fickle in this respect that I give up all hopes of its ever becoming popular here.

Montclair, N. J. E. WILLIAMS.

[Both Mr. Williams and Pres. Wilder favor us with sketches of the Figue d' Alencon Pear, which may be described as fig-shaped with a short, stout stalk inclined to a fleshy lip.—EDS.]

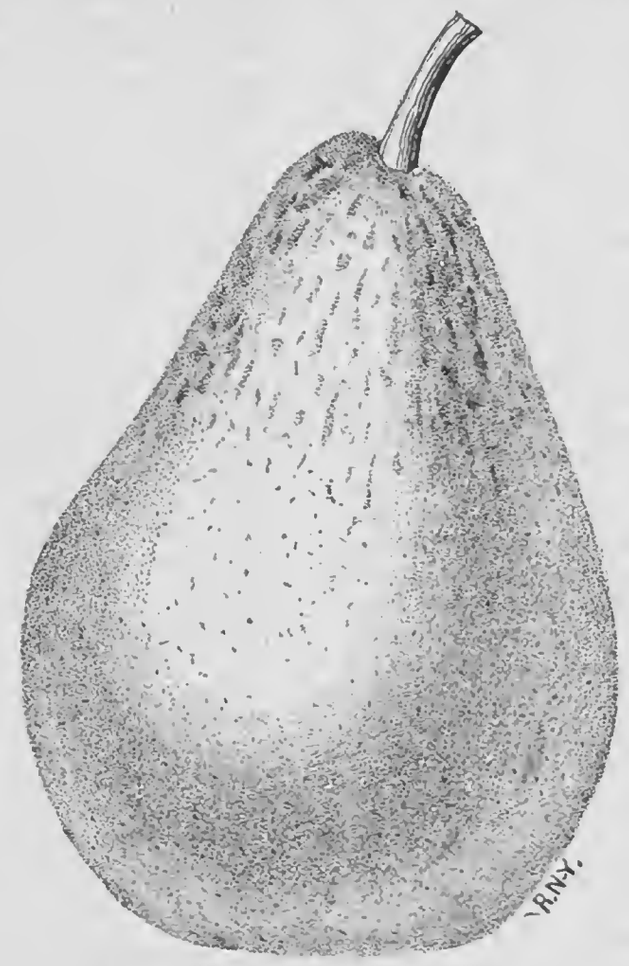
THAT FIGUE D'ALENCON PEAR.

BY that name I wrongly called a fruit pictured in a late RURAL. Its label and its likeness to Downing's description of the Figue, in all but shape, misled me. The true Figue is so named from its fig shape. As stated in his note, C. M. Hovey, than whom American pomology boasts no one more accurate and venerable, at first thought the portrait might be that of the Doyenné D'Alencon. But specimens just ripening sent me by him refute the claim as to form, color and season of fruiting. Perhaps the pear sent the RURAL and in dispute, is the Beurré Gris d'Hiver Nouveau. But the marked likeness of that portrayed, to one I have in different soil, by the latter name, starts a doubt about their identity. So now thinks Mr. Hovey.

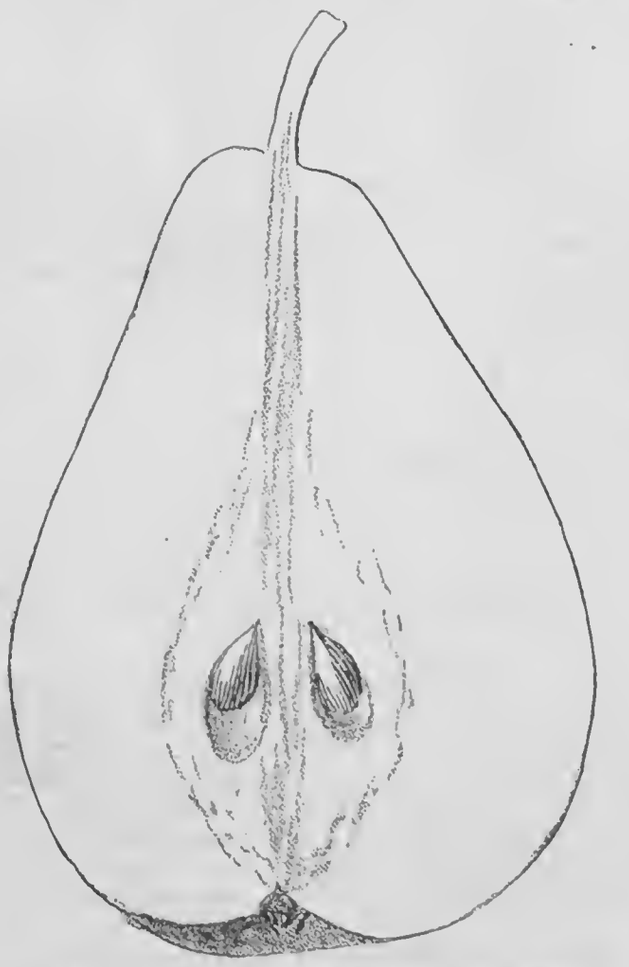
With the help of Mr. Hovey's half century's accurate knowledge of fruits, I shall get a correct verdict in the Fall, which shall be published. In the meantime, let all to whom I have sent cions of the pictured fruit rest content that they have a fine winter pear. The RURAL'S portrait of the pear in dispute is accurate. Some specimens are a little plumper and more shouldered around the stem. It has when picked a sort of an olive russet skin, or russet on an olive ground. It ripens up to a bright cinnamon russet, on a dullish yellow ground. The flesh is greenish white, buttery, somewhat granular and of a very high and peculiar flavor and aroma. It keeps from November to February. It should be kept in close boxes and often inspected, as it both wilts and rots readily.

GEN. WM. H. NOBLE.

Bridgeport, Conn.



DUVAL PEAR. From Nature. Fig. 248



DUVAL PEAR. Cross Section. Fig. 249.

THE DUVAL PEAR.

(*See, also, editorial page.*)

The pear Duval (Fig. 248, with cross-section at Fig. 249) is an old variety received from France about 50 years ago. Downing's description is correct. By the rules of the Pomological Society it would be classed as good to very good, but there are so many of its season of better quality that it has dropped out of cultivation except in a few of our collections.

MARSHALL C. WILDER.

THAT "SEEDLING" AFFIX.

I STAND by our veteran pomologist, C. M. Hovey, in adding "seedling" to its originator's name, given to a new fruit. No other word tells so briefly just what we want to know. It is due to the originator and to pomological history, that this affix should follow his name. Every new fruit is a seedling, but not every new fruit knows its own father. Because some hedge-grown wilding, some came-by-chance good fruit is found, the finder thereof gains no right to christen it after himself as "seedling." If I raise new fruit, and name it after another, the affix of seedling would be wrong, and if the name was in the possessive, I would tell a lie. But when to the name of its author, as in Hovey's Seedling Strawberry or Cherry, "seedling" is added, you have in the two words the history of the fruit. Any body who can claim the parentage of two such fruits, ought to covet and be proud of the record which that word seedling fastens to his name and to the literature of the orchard.

GEN. W. H. NOBLE.

Horticultural.

STRAWBERRY BLIGHT.

EVERY strawberry grower is familiar with the white spots that occur on the leaves of certain varieties of the berry. This disease is very common from the Atlantic to the Pacific, yet very few know its real cause. The white spots are circular, about one-eighth of an inch in diameter; and surrounded by a dark red stripe. An examination of the spots with a lens will disclose in the center of the white spot a number of small mealy tufts. These little tufts are exceedingly minute, and their color resembles that of the spot so closely that it requires patience and close examination to find them. The small mealy tufts consist of an immense number of cylindrical bodies supported on slender stalks. These small bodies are the spores or reproductive bodies of a fungus known to botonists as Ramularia fragaria (Pk). The disease then is not caused by the scalding heat of the sun, nor is it the work of insects; but it is caused by the minute parasite mentioned above.

Many, if not all, of the higher plants serve as hosts for one or more species of fungi. Several of these parasites attack the strawberry, but the one mentioned is the most destructive. As far as made out, the life history of this fungus is about as follows: The vegetative portion of the fungus (called mycelium) consists of slender colorless threads, which are exceedingly minute, and first appear in the tissue of the leaf, ultimately destroying the vitality of the cells in their immediate vicinity and causing the white spots described above. The reproductive bodies are formed on the slender branching threads, beneath the epidermis of the leaf, and when they have attained the proper size, they rupture this covering and appear in the center of the white spot in small tufts.

At Fig. 246 is shown a portion of a leaf

Fig. 246.

of a strawberry, showing spots of the natural size. Fig. 247 is a tuft of spores showing the supporting stalks and mycelium.

The disease is usually more abundant in old beds where the plants have become thick and

matted. Strong plants that have received good cultivation are comparatively free from the attacks of the fungus. Certain varieties suffer more from the effects of the disease than

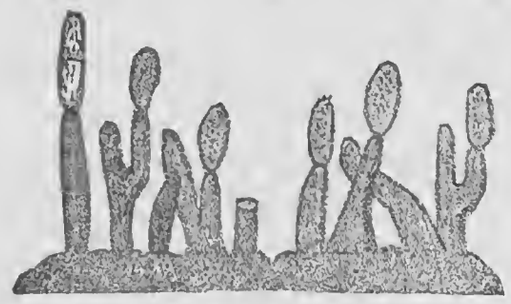


Fig. 247.

others. Downing, Cumberland, Captain Jack, and Wilson usually blight badly; while Crescent, Bidwell, Jersey Queen, Monarch and Manchester are comparatively free from its attacks. Lime is one of the best known remedies; it should be applied when the leaves are wet, commencing early in Spring, and repeating the operation every two or three weeks. B. T. GALLOWAY.

Columbia, Mo.

BERRY TRAY.

THE design for the berry tray shown at Fig. 251 was sent us by Mr. Dayton McCollum, of Mahoning Co., Ohio. The end pieces are four

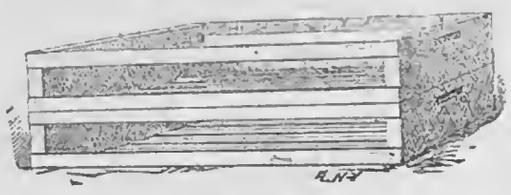

Fig. 261.

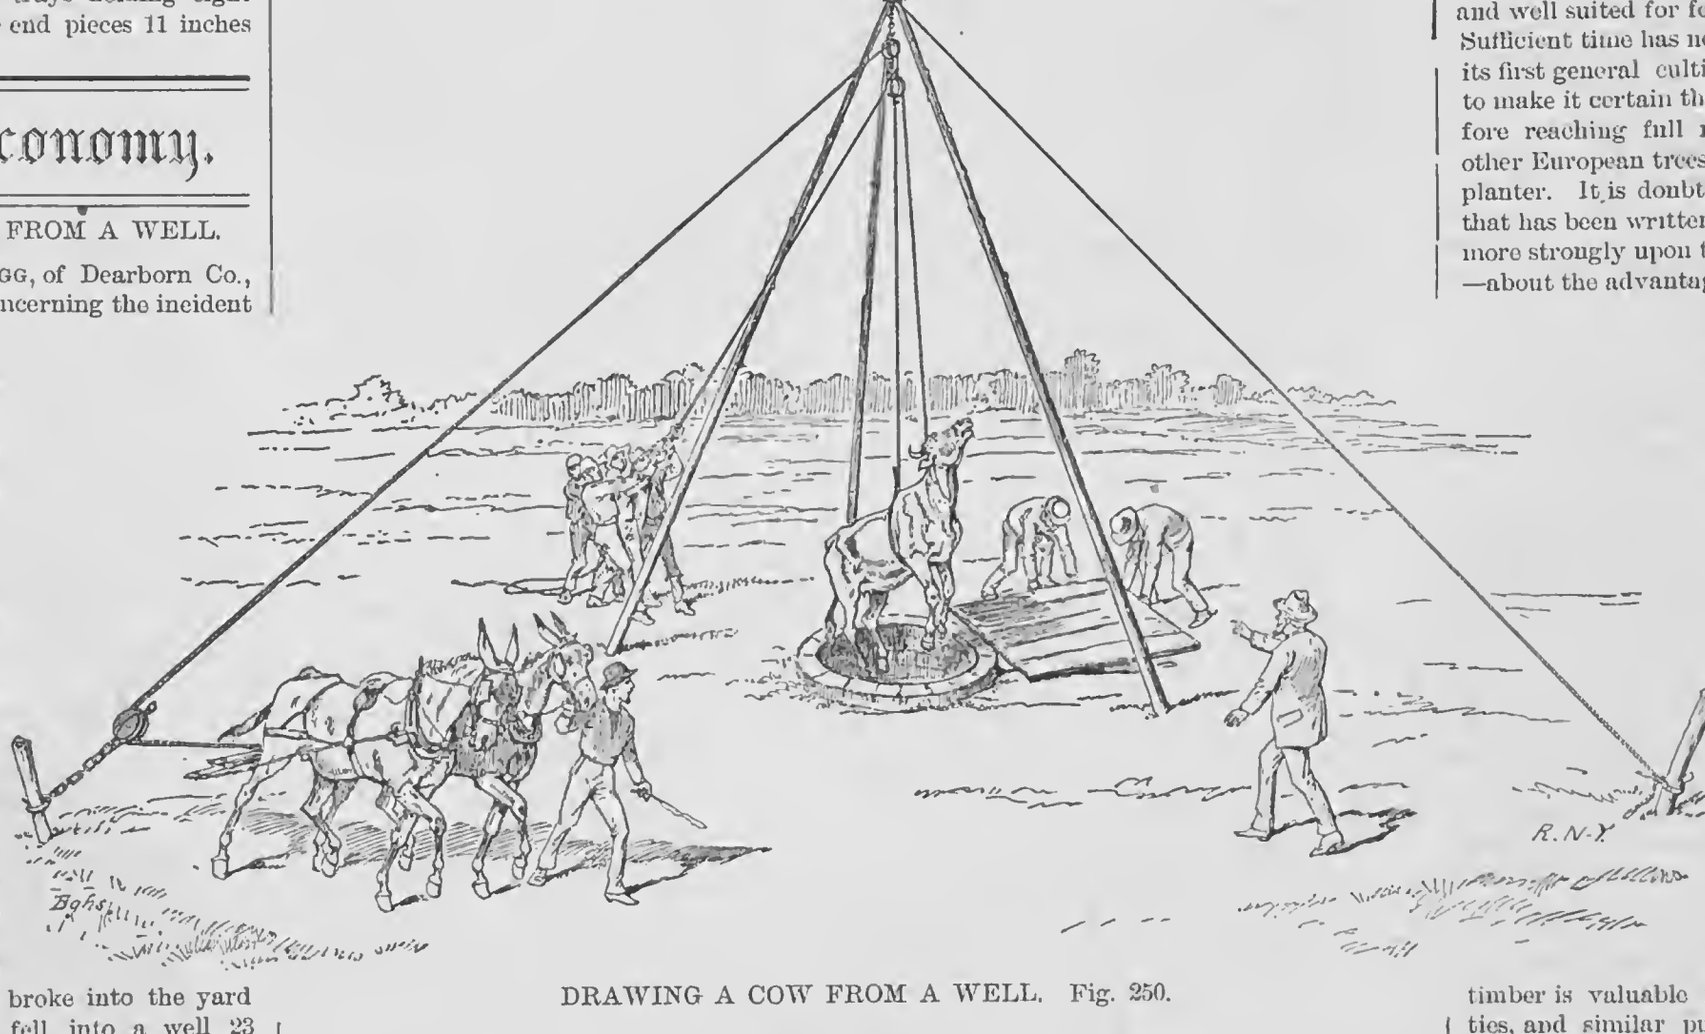
inches wide, 16½ inches long, and one inch thick. There are two laths for each side, two feet long, and six laths for the bottom. The bottom laths are sunk their thickness in the end pieces by plowing out one-half inch wide, and the thickness of the laths which makes the bottom laths one inch shorter than those at the side. A space one-half inch wide, one-half inch deep and four inches long is scooped out of each end to be used as a handle in lifting. A three-eighths-inch hole is bored in the top and bottom of each end piece. Pins put in at the top will fit in these holes and hold the trays when placed one on top of the other. The trays are designed for a home market and can be piled as high as desired, or three or more, with a cover, can be fastened together for shipping. To make trays holding eight quart baskets, make the end pieces 11 inches long.

Farm Economy.

DRAWING A COW FROM A WELL.

MESSRS. R. & P. GREGG, of Dearborn Co., Ind., send us the facts concerning the incident which our artist has illustrated at Fig. 250. In a country where wells and cisterns abound it is not uncommon for animals to fall into these openings. In a large cistern, it is frequently possible to build a track up which the prisoner may safely walk to the ground, or to throw in hay or straw for the animal to trample until it is raised high enough to jump out. When the animal is imprisoned in a small well so that it cannot turn, it is necessary to pull it straight out. In the case which we illustrate a heifer weighing 1,000 pounds, broke into the yard during the night and fell into a well 23 feet deep. She fell to the bottom with her head just above the water, where she lay looking up as though imploring aid. It seemed at first a hopeless case, but at last a plan was proposed that proved successful. Three strong poles 16 feet long, were raised over the well, chained together at the top, so that they stood over the well like a three-legged stool. Two sets of hay-fork ropes and tackles were obtained and made fast to the chain at the top. One rope was passed round the heifer, just back of the fore legs, and fastened. The other end was brought down through a pulley, as shown in the picture. A span of strong mules provided the motive power at the end of the rope. The other rope was fastened about the heifer's horns. A group of men pulled at this, and thus kept the animal's head from falling to one side and catching on the stones. A steady pull by the mules brought the heifer out without injury. As soon as she cleared the well curb, a door was pushed under her and she was lowered to the ground and the ropes were removed. In a short time she was upon her feet, apparently but little the worse for the accident. It frequently happens in accidents of this kind that animals are in danger of drowning, or of beating their heads against the wall. In such cases a halter or rope should always be put on the animal's head to hold it until help can be brought.



DRAWING A COW FROM A WELL. Fig. 250.

What Others Say

TREES AND TREE PLANTING.—The Annual Report of the Mass. Board of Agriculture publishes "Some Additional Notes upon Trees and Tree Planting," by Prof. C. S. Sargent. The other notes were printed in 1875 and 1878. Many of the conclusions then reached have not been substantiated by further investigations. Prof. Sargent was then impressed with the value of certain foreign trees for general cultivation in Massachusetts. He is now convinced that the native trees are better suited to that State than any exotic trees can be.

The European lindens, of which two or three species are cultivated, are in every way inferior, except in perfume of flower, to our native species. They suffer greatly from the attacks of various wood-borers, and usually perish before reaching any great age. The Sycamore Maple (Acer pseudo-platanus), a common European species, largely cultivated there for its valuable timber, and early and quite generally planted in Eastern Massachusetts, grows, like many European trees, very rapidly while young, but is soon unsightly here, short-lived, and quite worthless for any economic purposes.

The Norway Maple (Acer platanoides) is a more valuable tree in Mass., although greatly inferior to our native Sugar and Red Maples in beauty and general usefulness. It grows rapidly and vigorously, especially near the sea, reproducing itself freely, and giving every promise of reaching as great development as in its native land. The European Ash (Fraxinus excelsior), and its innumerable varieties, once largely and now occasionally planted in Massachusetts, are short-lived, brittle and utterly worthless trees, which should be exterminated in every Massachusetts plantation, to make room for our noble White Ash (Fraxinus Americana), which nowhere thrives with greater vigor or yields better returns to the planter.

It is too soon, perhaps, to speak with any degree of certainty in regard to the future of the European Sycamore (Platanus orientalis) in Massachusetts. Young trees, however, forty or fifty years old, grow with a vigor now never attained by our native species, and certainly give promise of long life and full development. Two species of elm (Ulmus campestris and U. montana), natives of Europe, thrive as well or nearly as well in Massachusetts as any of our native species. Specimens of the former attain a size in Eastern Massachusetts never reached there by any other foreign tree, with the exception, perhaps, of the White Willow: while the Dutch Elm (U. montana), now everywhere, reproduces itself from seed, and will doubtless eventually become completely naturalized in our woods.

The European Oak (Quercus robur) has always been a favorite tree among Massachusetts planters of a certain class. This tree grows there very rapidly when young; it can be easily raised and very easily transplanted; Its habit is excellent, and it carries its green foliage into early Winter, long after our native trees have shed their leaves. It is, perhaps, however, the most unsatisfactory deciduous tree which has ever been planted in Massachusetts. The promise of its early life is never realized. The European Oak begins to fail in Massachusetts when about 20 years old, with the cracking of the main stem, and then, after dragging out a wretched existence for a few years longer, miserably perishes. Tens of thousands of these trees have been planted in the State during the last century, but it is now almost impossible to find anywhere a healthy specimen more than 30 years old, while all the older trees have now almost entirely disappeared from the neighborhood.

The European Beech (and its varieties), although, perhaps, less beautiful and certainly less graceful than its American prototype, grows and thrives in Massachusetts, if not as freely as in Europe, yet sufficiently well to make it an interesting and valuable addition to all ornamental plantations there. The European birch, very like one of our smaller American species, and its numerous varieties, are graceful additions to our garden sylva, although not to be compared in beauty, vigor, and in economic value with several of the birches native of Massachusetts.

If Europe has given us few valuable deciduous trees, its contribution of conifers to our plantations is still less important. It was once believed, and no one, perhaps, was more firmly impressed with this belief than Prof. S., that the Scotch Pine (Pinus sylvestris), one of the great timber trees of Northern Europe, was destined to become an important economic factor in New England forests and plantations. This opinion, based upon the deceptive and insufficient evidence of the early promise of this tree, was reached too hastily. The past 10 years have shown that the Scotch Pine is a failure in New England as an ornamental and as a timber tree. It is very hardy; it grows quickly and easily from seed, and young plants can be raised and sold more cheaply, perhaps, than the seedlings of any other coniferous tree. They are not fastidious about soil and are proof against any exposure or hardship. The young trees, during the first 20 years of their life, grow with astonishing rapidity, and then either die outright, from some as yet inexplicable cause, or begin to fail gradually, and perish long before reaching maturity. It has cost American planters something in money and a great deal in disappointed hopes to discover the worthlessness of the Scotch Pine in this country. The Scotch Pine is still raised and sold in great numbers in some parts of the West, where rapid growth and perfect hardiness of the young plants on the northern prairies make it indispensable in all windbreaks and shelter plantations, at least in the opinion of men engaged in selling the plants to settlers.

The Austrian Pine (Pinus Austriaca), less widely planted and less thoroughly tried in Massachusetts than the Scotch Pine, promises also to prove a total failure there. The young plants grow rapidly and are very hardy, but they begin to fail early, and will probably disappear entirely before they are 50 years old. The cultivation of the Austrian Pine in Massachusetts should now be abandoned, and our native Red Pine (Pinus resinosa), a more beautiful and in every way more valuable tree, be substituted for it.

The Norway Spruce (Picea excelsa) has for many years been the most widely distributed and most generally cultivated foreign tree in Massachusetts. This tree, 30 years ago, had much, apparently, to recommend it to American planters. It is cheaply raised and easily transplanted; the young plants grow with surprising rapidity and vigor, and are hardly surpassed in grace and beauty by the young of any other of the spruces which will thrive in our climate. The general introduction of this tree into our plantations must nevertheless be regarded as a public misfortune. It has added nothing to their permanent value, and it has interfered with the cultivation of more valuable native trees, like the White Pine and White Spruce. The Norway Spruce, in spite of its early promise, must be acknowledged to be a complete failure in eastern America. It has passed its prime there and is almost decrepid before it is half a century old; it will never produce timber here, and it becomes unsightly just at that period of life when trees should become really handsome in full and free development.

It remains to speak of the European Larch. Something more is known of this tree in Massachusetts than was known 10 years ago, but not enough yet to speak with anything like certainty of its real and permanent value in Massachusetts plantations. The European Larch, at least during the first 50 years of its life, grows more rapidly than our American Larch, and more rapidly than most coniferous trees of equal economic value.

The European Larch grows rapidly upon the poorest soil of Massachusetts; it has begun to reproduce itself spontaneously, and there is good reason for believing that it will become a long-lived and valuable tree. The wood which it produces is hard, solid and durable, and well suited for fencing and railway ties. Sufficient time has not elapsed, however, since its first general cultivation in New England to make it certain that the larch will not, before reaching full maturity, like so many other European trees, utterly disappoint the planter. It is doubtful, too, in spite of all that has been written—and no one has spoken more strongly upon this subject than Prof. S.—about the advantage to be derived from cultivating this tree in Massachusetts, whether the European Larch can properly have any permanent place in our forests. Indeed, it seems to be more evident every year that the European Larch can do nothing for us which our native trees cannot do better and more economically. The larch will grow and make timber rapidly upon poor soil; but soil which will produce good larch timber will produce White Pine, and White Pine is a far more valuable article commercially than larch. Larch timber is valuable for fence posts, railway ties, and similar purposes, where durability with contact with the soil is necessary. The wood of our native chestnut possesses these qualities to an admirable degree, and the chestnut will flourish on land not much better than that which will produce larch. It is now known that chestnut railway ties are far more valuable than larch ties, and the chestnut can be more cheaply and easily grown than the larch, and will make timber more rapidly. In a State, therefore, where the native White Pine will thrive upon its poorest land, and the native chestnut can be depended upon to furnish posts and ties economically, it does not seem necessary to introduce a foreign tree, especially when no more is known about it than is now known about the larch, whose only merits are that it will flourish upon poor soil and produce durable timber. This tree can perhaps, however, be profitably grown in the region north of Massachusetts, beyond the natural range of the chestnut, and where no native tree producing such durable wood as

rapidly as the European Larch is to be found Many of these facts relating to the behavior of European trees in this country are now well known to nurserymen and other experienced planters. Probably where one native tree is now planted in Massachusetts, five foreign trees are planted. The cause of this unfortunate condition of things will be found in the ignorance and indifference of planters, and in the shortsightedness of nurserymen who supply them with trees. The fault, if fault there is, in this matter, lies with the purchaser, however, rather than with the seller. The nurseryman, as long as he can find a market at good prices for cheaply-grown foreign trees, can hardly be expected to sacrifice immediate profits in creating a demand which does not now exist for better material, wise as such a policy would doubtless be for him in the long run.

Massachusetts, in spite of her many sins of omission and commission, has made some substantial progress in the art of sylviculture. Her most instructive plantations, however, are not those which have been made upon the European fashion, or rather with European trees, by men who have studied the subject in Europe or in European books upon forestry, instructive and valuable as all such plantations have certainly been in showing us what to avoid. The real progress in sylviculture in Massachusetts has been made by the farmers of Barnstable and Plymouth Counties, who have taught us how to plant and raise forests successfully and profitably under the most favorable conditions. The secret of their success must be sought where they sought and found it, not in foreign treatises, unsuited to the requirements of this community, but in the native woods, in full view of their own doorsteps, which told them what to plant and supplied them with material for planting.

It has been demonstrated in Barnstable County that a crop of Pitch Pine can be raised from seed with as much certainty as a crop of corn, and with much less expense; and that the loose and shifting sands of Cape Cod, useless for every other purpose, can, with the aid of this tree, be made to bear valuable crops of wood.

Not less interesting, certainly, and perhaps even more suggestive of future development towards the true policy for New England forest management, are the White Pine plantations made 40 or 50 years ago in Middleborough, Raynham, Bridgewater, and other towns in that part of Massachusetts.

These plantations were made upon barren, sandy soil, entirely exhausted by long cultivation, with seedling pines dug in the neighboring woods. The young trees are set in shallow furrows, at odd times, without interfering with other farm work, and so with little expense to the farmer. A distance varying from five to twelve feet in different plantations was left between the trees, which, after planting, received no subsequent care or thinning. These trees, with few exceptions, have grown rapidly and with great vigor, and are now worth, on the stump, $60 to $75 an acre; and men are still living in these towns who have cut and sold White Pine saw-logs at the rate of $150 an acre, from seedling plants set by themselves.

These plantations are valuable, not in the great amount of timber which they have produced, but because they show how our farmers, with a trifling outlay, can improve their farms by covering worn-out and unproductive land with a valuable crop, which, if left to mature, will continue to increase in value for generations. They show that White Pine, the most valuable tree in New England, can be successfully and profitably cultivated; but, unfortunately they do not yet show the method of culture which can best be adopted in order to make this tree yield the greatest returns.

There are other trees, besides the White Pine, which the farmers of Massachusetts can cultivate with profit. The wood of some of the native trees of Massachusetts is in great demand, and will soon become rare and expensive everywhere. The best hickory has already been cut, and as no wood has ever been found to take the place of hickory for the particular uses to which that wood is applied, and as there is no hickory except in the United States, the value of any farm can now be increased by a plantation of hickories. White Ash of good quality has also become very scarce, and there can be no loss in planting this tree wherever good land can be spared for it, or in protecting and encouraging the young plants wherever they have sprung up spontaneously. Chestnut, too, must always be in demand for railway ties and fence posts, and there are rocky and unproductive hills in every town in the State, which might profitably be covered with groves of this tree.

HAY-MAKING.—Mr. James Howard, in an address before the English Farmers' Club, on hay-making, took the ground that in order to avoid loss, both in quantity and quality, pastures should be cut when the grasses are in flower, and that of two evils, cutting too soon and cutting too late, the latter is the greater. In very heavy grass where there is danger of lodging, it is unwise to wait even for the flowering stage. As a rule, farmers wait too long before cutting hay. They are anxious to secure an added bulk, forgetting that much of this bulk may be tough, woody fibre. The component parts of grasses mostly fitted for nutrition are those soluble in water, and the great object should be to secure the crop when it contains the greatest amount of gluten, sugar and other matter soluble in water. This stage is reached, in most grasses, when the flowers are well formed and before the seeds ripen. As a practical test, Mr. Howard watches the sorrel in his fields. When this begins to ripen he begins to make preparations for cutting. As to cutting, he thinks the extra bulk of hay obtained through the closer and more level cutting of a good machine is nearly sufficient to pay the cost of cutting. At the same time, nothing is gained by the practice of close shaving, as the roots of the grasses are always injured by this practice. Of all farm operations, none calls for quicker work than hay making. The most successful manager makes and secures his hay in the shortest time, and the quicker the work is accomplished, the less it will cost. Mr. Howard's plan is to cut a small area and at once put the tedder at work upon the cut grass, keeping the machine in motion all the time, if necessary tossing and re-tossing the hay. It was the old fashion in hand cutting to let the hay dry in the swaths. It would have paid even then to scatter and turn the hay by hand. Nowadays the employment of hand labor is to be avoided as far as possible. The object of a good hay maker is to get his hay into cocks as soon as possible, as it is safest and most easily handled in that condition. For this purpose the heavy horse rakes with the dumping done by the horse, are admirable. The hay is drawn into windrows and then the rake is run lengthwise of these, drawing the hay into piles which by a few strokes from the fork are easily turned into well shaped cocks.

SPICE.

A CORRESPONDENT of the Iowa Homestead thinks he has discovered a new way of milking that increases the flow of milk. He used to milk with "one hand up while the other was down." He now milks with "both hands up and down together, instead of alternately." The correspondent referred to thinks he has increased the flow of milk from one cow by the simultaneous movement of both hands at least eight or 10 per cent, and from another, four or five per cent. The above note we find in the Chicago Live Stock Journal.....

E. P. ROE says, in June Harper's, that he once saw the driver of a stage load of ladies, bound out of his vehicle to kill a garter-snake—the pallid females looking on meanwhile as if the earth were being rid of some terrible and venomous thing. They ought to have known that the poor little reptile was as harmless as one of their own garters, and quite as useful in its way.....

MR. ROE, one October day, took a stone pot of the largest size and put in first a layer of Isabella grapes, then a double thickness of straw paper, then alternate layers of grapes and paper until the pot was full. A cloth was next pasted over the stone cover so as to make the pot water-tight. The pot was then buried on a dry knoll below the reach of frost, and dug up again on New Year's. The grapes looked, and tasted as if they had just been picked from the vine.....

THE man who can allow a cow to kick him over three times and come up smiling each time, and refuse to retaliate, can cure a kicking cow, says L. S. Hardin in the Weekly Press.....

Prof. A. J. Cook much prefers tobacco to Mr. Woodward's lard and kerosene for lice on cattle, and he speaks from "abundant experience." For poultry he has found lard and kerosene or sulphur and kerosene excellent. He always keeps such a mixture in the poultry house, and every few weeks in Summer rubs the roost poles with it, and occasionally at night under the wings and tails and about the breasts of his birds. Such use is not untidy, takes little time and does effectually destroy the vermin. But on cattle or horses this mixture is disagreeable. The greased hair does not become smooth for days, and catches much dirt. Again, it is difficult to use so that a single application will suffice. On the other hand, he has found five minutes enough to make a thorough application of the tobacco decoction. It is not unpleasant to apply, and if used on a warm day, and the animal is blanketed well for an hour, it is attended with no danger.....

Prof. Cook always observes the last precaution. Chilling a cow in Winter may produce abortion or induce an ague, which should always be avoided. The very next morning after tobacco treatment, the animal can be curried and its hair made as smooth as ever. He has found a single washing to be wonderfully efficient..... .. ..

Not one of the so-called agricultural colleges in this country has accomplished desirable results without the compensated, obligatory student labor system, says Prof. F. A. Gulley in the late Report of the Agricultural College of Mississippi.....

TWO axioms connected with the breeding of stock are frequently heard among those who are interested in the subject, says the London Live Stock Journal. One is that "like produces like," and the other that "breeding is a lottery." Both cannot possibly be correct, and it may be said that neither is absolutely and invariably true.....

IT seems never to strike breeders that before allowing a mare to be served they should at least take the trouble to ascertain if the horse is in good health, for it cannot be taken for granted that because when robust and in strong exercise a stallion has fathered an Eclipse or a St. Simon, he will be capable of begetting similar stock when ill and uncared for.....

THE Journal further says that most breeders are familiar with the case of Lord Morton's Arabian mare, which to a quagga, or species of wild African ass, produced a hybrid having distinct marks of the quagga, and which in 1817, 1818 and 1821, having in these years been mated with an Arabian horse, gave birth successively to three foals, all of which bore unequivocal marks of the quagga. Still if certain considerations are constantly kept in view, it will be found in most cases that the maxim that like begets like is much nearer the truth than the other, that breeding is a lottery and altogether beyond the control of the stock owner .....

A WRITER in the Poultry Yard caught a troublesome mink by setting a steel trap just at the edge of the stream where the mink came out. A chicken was killed and the blood sprinkled about the trap. Then the body was suspended on a stake just over the trap.....

THE Herald of Health calls attention to the foolish though very general habit of making the back of the vest of the very thinnest stuff. The back of the vest should be made as thick and warm as the front. The first sensation of chilliness always comes at the spine. The lungs are protected in front by layers of muscle, fat and ribs, while at the back they come much nearer the surface. Many persons seek to wear "chest protectors," when the real protection is needed at the back. This could be supplied by a thicker back to the vest.....

OUR good friend, Dr. T. H. Hoskins, says, in the Vermont State Journal, that, practically speaking, good manure is too rich in nitrogen, and needs to be extended by the addition of both phosphoric acid and potash, especially the former. For use with manure there is no need of buying a nitrogenous superphosphate, for a plain superphosphate is much cheaper and quite as good. Along with this, use 10 or 15 bushels of unleached hard-wood ashes to the acre, and a half dressing of manure will give far better results than a full dressing used alone. We guess that the above is quite sound advice..

THE Massachusetts Experiment Station says that a bushel of average hard-wood ashes is worth, for the potash and phosphoric acid alone, 18 cents, taking the commercial price of these ingredients as a standard.

SUNFLOWER seeds are especially good for fowls when fed in proper proportion with grains, says Mr. Armstrong of the Husbandman. They are very oily, having somewhat the nature of flax seed. The usual estimate of yield is a gallon of oil to a bushel of seed, and the oil is said to be of superior character for many mechanical uses, and, when suitably refined, is used on the table.....

THE farmer who sits down to his breakfast of fried pork and potatoes through the month of June, while his neighbor revels in strawberries, doubtless flatters himself that the strawberries cost more labor than the pork did, and that he is thus on the right financial side. But he isn't. The Orange Co., Farmer thinks that he never made a greater mistake in his life. If the absence of fruit only punished the man who is responsible for it, we should not much care, but the trouble with it is that the wife and children must suffer for his sins of omission as well as himself.....

THE horse which can plow an acre while another is plowing half an acre, or that which can carry a load of passengers 10 miles while another is going five, independent of all considerations of amusement, taste, or what is generally called fancy, is absolutely worth twice as much to his owner as the other. So says Mr. H. W. Herbert. The Live Stock Journal (Chicago) takes the view that double the speed in traveling considerably more than doubles the practical value of the horse There is just as much trouble and expense in raising the slower horse. It is really working for less than half pay either to raise or use him. No farmer can afford this. So let us see if we can not, by proper selection, breeding, and breaking, improve the walking gait, and increase correspondingly the value of the general business horse.....

WE fancy that Director Lazenby, of the Ohio Ex. Station, in his trials of chemical manures upon corn, has made the mistake of selecting plots which were already well furnished with plant food. His fertilized plots, taken as a whole, give no increase of grain over those not fertilized. It is a pity the same careful experiments might not have been conducted on an impoverished soil.....

MR. LAZENBY says that the name "rust-proof," as applied to a variety of oats, has no significance. It is as subject to rust as any other..... .....

REFERRING to the Bohemian oat fraud, he says that these oats are commercially not equal to common oats in value.....

OF 34 different kinds of earliest potatoes tested, Stray Beauty was five days ahead of any other. It was planted May 4th, ripening July 20. Beauty of Hebron, Charles Downing, Early Durham, Early Gem, Early Harvest, Early Ohio, Early Pearl, Gardner's Early, Prince Edward's Early Rose, and Vanguard came next, ripening the same day, July 25. We are surprised that the Early Ohio is in this list. At the Rural Farm it is a week earlier than B. of Hebron..... .....

THE yield of the above was as follows:—Early Harvest 336 bushels; Early Durham 335; Early Ohio 324; Chas Downing 319; Beauty of Hebron 287; Prince Edward's 274; Gardner's Early 270; Early Pearl 285; Vanguard 195....

Lee's Favorite, ripening two days after, yielded 422 bushels, the greatest yield; and Clark's No. 1, ripening five days later, 363 bushels, the next largest.....

OF the second-early, Cullum's Superb, Pride of the West and Weld's No. 22 gave the best yields of marketable potatoes, while Pride of the West shows the best total yield. Quality poor. Of late kinds James Vick, Perfect Gem and Red Star head the list for marketable yield, and Jumbo for total yield—James Vick, second, being 451 and 449 bushels respectively.

THE Mammoth Pearl planted six inches deep yielded 329 bushels; eight inches 247; 10 inches 210; 12 inches 175. The yield of small tubers decreased with the depth the same as in the RURAL experiments.

Everywhere.

TRANSCONTINENTAL LETTERS.—LII.

MARY WAGER-FISHER.

The Lower Columbia River; Astoria; Sunday there; an early settler; back to Portland.

On the morning following our arrival in Portland, we boarded, at six o'clock, one of the steamers of the Oregon Railway and Navigation Co., which run from Portland to Astoria, for the purpose of seeing the lower Columbia. Readers of the RURAL who have followed our wanderings as detailed in this series of letters, may remember our trip up the Columbia to The Dalles, and appreciate our desire to see the lower river as well, which furnishes a scenic panorama of an altogether different character. The morning was foggy and it was fully nine o'clock before the fog lifted, after which the entire day was of the most radiant description, and the soft and graceful foliage of the river banks aglow with the brilliant hues of Autumn, borrowed added brilliancy from the blue-green color of the stiff pines that clothed the mountains rising in the distant background, and which in the extreme distance lay like so many undulating banks of hazy purplish hue against the roseate horizon, for it had a roseate tinge throughout the day. Occasionally an island, beautiful in vegetation, lay in the river—the rocks along a near shore were exquisite in mosses and vines, and as we sat on deck looking out from the stern I busied myself in making some sketches in color of some of the more striking views. An occupation of this kind invariably elicits a certain interest in the minds of one's fellow passengers, and "I wish I could sketch" is an exclamation I have many times heard. That an "accomplishment" of this character, which can be so readily acquired, is not a part of the education of every man and woman is one of the surprising things in this surprising world. As I sat at my work a young girl came and looked over my shoulder, and asked if I lived in Asto-

ria. If I did she thought she would like to get me to give her lessons in painting. She went on to tell me how she had learned to color photographs and would like to be an artist. I did not think it difficult to forecast her unartistic future. She had allowed decay to eat holes through her front teeth, and the money that should have plugged them with gold and bought a tooth brush had gone into artificial flowers, cheap ostrich feathers and jetted gimp trimmings for her dress. There is not much hope for a girl who allows furbelows and finery to win the day over care for her teeth.

One very striking triangular rock, of great hight, velvety green in color and with a clump of fir trees on the pointed top, goes by the name of Coffin Rock, because the Indians aforetime buried their dead upon it. A curious mountain range bears the name of Saddle Mountains from its resemblance to a saddle, and the nomenclature of the river scenes is suggestive of the practical rather than the esthetic sense of the early settlers. The scenery was exquisitely beautiful all the way, with an occasional clearing, where farms lay in luxuriant meadows "level as a house floor." Occasionally we passed a saw-mill, or stopped at a landing; but the signs of habitation on either the Washington or Oregon shore were few and far between. But we heard of fine farms "lying back."

We reached Astoria at four in the afternoon, and after establishing ourselves in the Occident Hotel we took a stroll about town. In the hotel where we passed the night in Olympia, there was a hand-grenade hung at every door, and a similar, but less bountiful provision had been made for fire extinguishment in the Occident, and judging from the hotels we have since been in, I judge that Pacific Coast inns have been generally supplied with them.

Of course, every American youngster has read of John Jacob Astor, from whom Astoria was named, and of the fact of his having had a trading post there. I had fancied Astoria as being built on low, marshy ground and with a great sweep of level land back of it, and was pleasantly surprised to find the location quite the reverse. Indeed so high are the hills and bluffs and so narrow the strips of level land along the shore, that the business part of the town is built on piles over the water, which explains, I suppose, the reason why Astoria is called, on this coast, the "American Venice," and it is needless to say that it resembles Venice in not the smallest degree. Saw-mills and salmon canneries are the chief industries of the town, which has a population of between five and six thousand.

The following day was Sunday, and we went out to attend church. The first church we came to had, hanging in the vestibule, what appeared to be a portrait of the pastor—which I thought a new "wrinkle," and as we were not favorably impressed with that sort of advertising, we went on and entered another, which proved to be Presbyterian. An old Englishman preached about heroism and laid much stress upon the great moral heroism of the working classes in England during our War of the Rebellion. As the looms of Manchester and other manufacturing centers were largely fed by American cotton, the sufferings of the people were great, and still they stood solidly by the North in their hatred of slave labor. The preacher said that part of the history of the war had never been written. I counted the persons in attendance at this service—28 men and 50 women, and the number of men on this coast is many times greater than that of the women.

After church, we climbed a high hill back of the town where we could see the breakers of the ocean as they broke on the bar of the river 15 miles away—for Astoria is this distance from the mouth of the Columbia. Afterward, we went in search of the site of Astor's old fort, and seeing an elderly woman in the street accompanied by a younger one, I asked her if she could direct us to it. "It was right there!" she said, pointing to the opposite side of the street, "just the other side of that house, in the same lot. Of course, when those grounds were fixed up and terraced, the place of the old fort was filled up. There was quite a hole there." "And who owns this property now?" I asked. "I do," she replied, "I was the first white woman to come to Astoria, and I've lived her ever since. I came here in 1846, and Astor then had sold out to the Hudson Bay Company, and that was removed soon after. Where he had his trading post was a block below here toward the river—a street now runs through the identical spot. Won't you come in the house?" Of course, we went in, glad of the opportunity to hear this pioneer talk of the old times. Her house was new and spacious, luxuriously fitted up in modern style; but she seemed to be quite alone in it—her husband dead and her children married. She was fashionably dressed in a gown of black satin; but any amount of prosperity could not erase from her face the imprint of hard work that had been her lot.

That evening, like the previous one, was of great splendor and we sat long and late on the pier of a huge saw-mill, watching the sunset effect on the broad and mighty river, and the far away faint lines of the mountains guarding its mouth. Steamers came in and passed out over the bar, fishes darted about in the water in myriads, and it was only the chill of the evening air that drove us from the charming spot. We went on board the steamer that evening, and early next morning were retracing our way to Portland. The day, like all the days, was perfect in clearness, and when we had reached the Willamette junction with the Columbia, St. Helen's, Ranier, Adams, Hood and Jefferson—all snow peaks—could be seen. All the way up the Willamette to Portland I thought the scenery the prettiest I had ever seen—the gorgeous Autumn foliage, the beautiful shores of the river, the gathering mist with the sunshine illuminating it, indeed it was a delicious sight, and like the girl who colored photographs, and wanted to be an artist, I wished I could paint what I saw.

RURAL SPECIAL REPORTS.

Kansas.

PARSON, Labette Co., May 29.—After a couple of heavy dashes of rain in the first days of the month, we have had dry, hot weather, the temperature being from 70° to 98° in the shade at 5 P. M. Wheat and oats are headed, but are threatened with the chinch-bug, and possibly with drought, as grass, strawberries and peas are already suffering therefrom. The two latter have sold as low as 70 cents per bushel for peas, and $1.60 for strawberries. Prices of strawberries would have gone still lower if seasonable weather had prevailed. Corn is by far the most important of our productions, and never looked better. It is now from six to 36 inches high, and exceedingly clean and vigorous. In the whole of the State, it is in this condition. A friend who passed hence *via* the "Santa Fé" to Pueblo, Colo., says: "Corn is immense in extent as far as we traveled before dark, and invariably well cultivated and clean, with a full stand. Apples will fall below an average; blackberries seem to have been "winter-killed; January had an unprecedented number of cold days, ranging from 10° to 20° below zero. We have had 25° below in former years without damage; but only, say, for about one day in the month. There is more railroad building going on now than at any other period. This is induced by low prices of railroad material and the willingness of farmers and citizens to vote bonds in aid. All these extensions and branches will, on completion, fall into the hands of the Western and Southwestern trunk roads, which are stretching far and wide into the "unoccupied territory." Crops of wheat and oats are hardly fair. J. B.

New York.

STOCKTON, Chaut. Co., May 31.—This has been the most forward Spring known to this section for many years. Crops are all in, with few exceptions. Grass is looking well and promises a good crop. The chief industry of this section is dairying. Many new factories are being started. Until this year the factories made cheese; now nearly all have put in separators for the purpose of making butter. The latest ruling price for butter in this vicinity was 14 cents. Prices of produce and feed are:—corn 45 cents; oats 40; potatoes 50; meal per cwt., 90; bran, 80; provender corn and oats, $1; flour from $1.25 to $1.45 per sack.

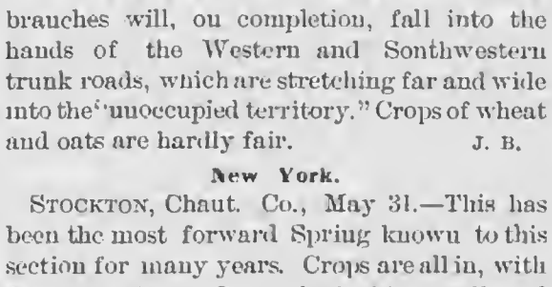
S. M. V.

Texas.

CLYDE, Callahan Co.—The weather has been so dry crops are almost all ruined—no rain for three months, and the ground hasn't been thoroughly wet for 12 months. Wheat and oats won't amount to anything—they're dead. Corn looks very well, but isn't growing much.

G. W. D.

MIDLAND, Midland Co., May 25.—We have not had a good general rain since September. All small grains are failures. Corn and cotton doubtful. Some little garden truck, irrigated from wells. Sheep are doing badly—too dry and too much Morrison tariff. Sheep can't be sold at $1.50 per head. J. S. C.



ANSWERS TO CORRESPONDENTS.

SUPPLEMENTARY FODDER CROPS.

G. S. S., Middleburgk, Pa.—As clover and Timothy are short, what would be a good crop to sow to supplement the scanty hay crop?

ANS.—Where the clover or the grass are light in a meadow, such places, or a whole field may be mown and then plowed up and sown with millet, and the new crop will be ready to cut for hay in two-and-a-half months; other land can also be used if there is time enough for maturity. Hungarian Grass (which is a smaller variety of millet than the common kind) will also make a good crop of hay. Either may be sown broadcast at the rate of ten or twelve quarts on an acre, and covered with a roller. A peck of seed is ample if the ground is in a fine condition, so that the seed will not be lost. A top-dressing of *fine* manure will send the crop along more rapidly and make a larger yield. Two hundred pounds of some good kind of superphosphate, sown broadcast and harrowed in, will pay well. With a little pains and manuring on the surface in good land, three to four tons of excellent hay may be obtained from millet or Hungarian Grass. There is a coarser and late-growing millet which should not be used. Some seedsmen call this the "German," and the kind with narrower leaves and taller and smaller stems, the "Golden." The latter is the better. In all cases these grasses should be cut *before* the seed matures, and while the stems are soft and green. The crop may be cut with a mowing machine, and left to wilt, and then be put up in tall cocks in which form it will dry nicely. The cocks should not be large but tall and slim, so the air can pass through. It would be well to let the grass lie on the ground till the second day, if the weather is good, turning it over before the first night, so that the dew will come on the green side. If a little salt is strewn amongst it when moved away, it will keep it from heating and do no harm for feeding. In no way can a farmer supplement his hay crop so easily as with millet. All large seedsmen keep the seed, which is cheap. Fodder corn will mature in three months, or less, if the weather is favorable, *i. e.* warm enough. In Pennsylvania it can be put in any time in June or early in July. There should be time enough for it to tassel out before any frost would kill it. This crop should be sown in drills and not too thick, so that every stalk will be fully grown and a a natural one. When grown in this form it is valuable food, but when sown broadcast and so thick that the stalks are mere stems without joints or substance, it is very poor food. The ground for fodder corn cannot be made too rich, and it should be cultivated frequently. This kind of corn will insure a large crop and a rapid growth. It should always be cut and put into stooks before it is touched by frost. When bound up in small bundles and about a dozen are got up in a stook, and a large band put around the top to hold them firmly, this fodder may be left out in the field till wanted, and it will keep well. The stacks may be bound around the top with bands of rye straw twisted together, or with willow twigs. It may be left till a dry time in the late Autumn and then be stored in the barn or in a stack, and in either case it will keep well and make the best of fodder for all kinds of stock.

EVERSION OF THE WOMB IN A COW.

P. W. S., Marksboro, N. J.—My six-year-old cow, a short time before calving, shows symptoms of falling of the womb, and a few hours after she "comes in," the womb comes out, and has to be put back and a stitch or two have to be taken in the vulva; what is the cause and what should be done?

ANSWERED BY F. L. KILBORNE, B. V. S.

The condition being unnatural, there is, of course, a cause for the eversion in every case. But there is not in every case an apparent cause. It may be due to an impoverished, relaxed condition of the system, brought about by insufficient or unsuitable food; to hot, damp, relaxing stables, or to disease. A common cause is the backward slope of the stall, which throws the weight of the abdominal viscera against the organ, forcing it backward. Violence, either in a natural or an assisted delivery, or pulling at the afterbirth may cause the eversion. In some cases, the eversion occurs without any apparent cause, owing perhaps to some predisposition on the part of the animal. In so far as one can remove the causes, there is a cure; otherwise, no. After the mishap has once occurred, it is very liable to occur at each succeeding parturition. Whenever the eversion does occur, carefully but thoroughly clean the organ with tepid water, in which may be added a few drops of carbolic acid or crystals of permanganate of potash. Then return it to place and retain with a truss or by the sutures, the former being preferable; place the animal in a stall with the hind feet the higher, and feed on sloppy or laxative food in moderate quantities for several days. Unless this animal is especially valuable for breeding purposes, we would advise fattening her for the butcher.

REFUSE ANIMAL MATTER AS A FERTILIZER.

T. A. P., South Bend, Ind.—I have bargained for a ton of fertilizer matter once a week for three or four months at $2 per ton. As nearly as I can tell, it consists of blood and a few bones. It smells so bad that I can hardly get close enough to it to tell what it is. The seller says it is the surplus of what he dries, grinds and ships East at $30 per ton. Is it cheap enough where barnyard manure can be got for 35 cents to 50 cents a cord? How should it be handled to keep it in proper shape until it is used?

ANS.—It is not safe to judge of the fertilizing value of any manure by its smell. The strongest and most disagreeable odor which comes from decaying substances, especially from animal matter, is sulphureted and carbureted hydrogen, produced by the decomposition of the carbonaceous matter and the sulphur. The odor of rotten eggs is due to the sulphureted hydrogen given off in the decomposition. The odor from decaying ammoniacal substances is pungent and not always disagreeable; the strong smell of a horse stable, for instance, is caused by volatile ammonia escaping. As to this particular matter, no opinion can be given from the statement, which is exceedingly indefinite. It is quite probable, however, if this stuff consists of the coarser refuse of dead animals, that it is well worth $2 per ton, unless it is very wet. At the price named for barnyard manure, however, there need be no anxiety as to other manures, the price being one that any farmer could well afford to give, even in the fertile West, and he would find it sufficient for every purpose. 2. The best way to manage decaying animal matter and to avoid the offensive odor, is to mix it with earth, and compost it; one load each of the decaying matter and earth would be sufficient, although three times the bulk of earth and a liberal mixture of lime is a common proportion in composting. There is no reason why manure should not be mixed with the compost, excepting that it is unnecessary.

APPLE BARRELS.

F. C. D., Daleville, Va.—1. What is the diameter of the heads and bilge set or tress hoop of apple barrels? 2. What kind of timber is best for staves; also for heads and also hoops? 3. What machines are used for making the staves?

ANS.—Two sizes of barrels are used in Western New York, one having a head 17 inches; the other one 16½ inches, in diameter. For the larger heads, "tress hoop" should be 17¼ inches; for the other, 17 inches inside diameter. The bilge hoop of the larger barrel should be 20 inches, and that of the other 19½ inches in side diameter, to give the barrel the proper shape. 2. Elm is the best timber for staves; but beech, soft maple, birch and ash are sometimes used; in fact, almost any timber that does not warp too badly will make staves. Heading is made of basswood, soft maple and beech. It can also be made of other kinds of timber. The hoops are made of ash or elm; but could be made of any tough timber. 3. Staves are cut of the proper thickness by a machine, from "bolts" (blocks split about six inches thick and of any width the timber will make). The bolts are put into boxes and thoroughly steamed through, and are then, while hot, cut into staves, and these sawed of the proper length and then piled in open piles to season, after which they are "jointed" by another machine which shapes the sides, so as to give the desired bilge to the barrel. Many machines are made for cutting staves, and all work with an up-and-down stroke. The heads are sawed by a saw running very fast and cutting lengthwise of the timber, which causes them to cut very smooth. They are afterward seasoned and then put into a machine which planes one side; after this they are jointed straight on the edges, and then "turned" by a machine of the proper size for the barrel. The hoops are made by hand and also by machinery. The hand-made are much the best, but cost considerably more than the others.

STRAINED SHOULDER MUSCLES IN A MARE.

F. C. McC., Beech Grove, Indiana.—What should be the treatment of a mare which, eight months ago, strained the inside muscles of the shoulder; effects never very severe, but more so at some times than at others?

ANSWERED BY F. L. KILBORNE.

Allow the animal a period of rest in a large box-stall or small inclosure, and apply a mild blister of equal parts of strong ammonia and sweet oil over the seat of the sprain. When the effect of the first application has passed off, repeat, if the animal is improving. If there is no improvement apply a more powerful blister, such as two drams powdered cantharides, one ounce of lard and five to ten drops of strong spirits of camphor. Cut the hair close and rub the blister well in against

the direction of the hair. Tie the animal so that she cannot rub the blistered surface with her mouth. When the blister is well raised (12 to 24 hours) carefully wash with Castile soap-suds, and anoint daily, until healed, with vaseline. Repeat this blister if necessary, or, this failing, try firing in points with the hot iron. At the outset it would be well to have applied a high-heeled shoe to relieve the strain.

PROPAGATING RASPBERRIES, ETC.

W. H. L., Harrisonburg, Va.—The best and most rapid way of propagating raspberries is by root cuttings. Take up the plants in the fall and cut the roots into pieces from one to three inches long. Then prepare boxes by boring holes in the bottom to insure drainage, placing little stones or bits of crock over them. Then cover with two inches of soil, then a layer of the root cuttings, and so on until the box is full. Bury this box in any dry soil so deep that the roots will not be frozen. It is well to cover with boards to carry off the water. In the Spring plant the roots in rich soil about three inches apart in drills, covering them three inches deep. If the cultivating is to be done with a horse, the drills should be three feet apart; if by hand, 18 inches. It is well to cover with mulch after planting to insure moisture. Of course, the cuttings may be made in the early Spring, but Mr. A. S. Fuller and other authorities prefer Fall as the roots callus during the Winter and thus start more readily. The Meshannock Potato is the same as Mercer we believe. It is not offered for sale that we know of.

MAKING AND KEEPING A PERMANENT MEADOW.

C. P., Trenton, N. Y.—A well fertilized piece of land has been seeded down with oats as a permanent meadow so long as it can be kept so without barnyard manure—soil, a gravelly loam—can the land be kept in good heart by the use of commercial fertilizers? How should it be treated?

ANS.—There will be no difficulty in keeping a permanent meadow in good condition if the right grasses and the proper treatment are used. There are Blue Grass meadows in Kentucky that have been in use for a century, and others in Europe that are hundreds of years old. Orchard Grass fields 40 years old are now in good condition and promise to continue so as long in the future. Orchard Grass, Meadow Fescue, Perennial Rye Grass, Yellow Oat Grass, Kentucky Blue Grass and Timothy, at the rate of six pounds of each per acre, will make a very good selection of seed. If the land is thoroughly well prepared before seeding, and the grass is kept reasonably well manured or fertilized and a little fresh seed is given every three or four years, the meadow may be expected to last a lifetime.

TEATS GROWN TOGETHER.

S. E. B. Endora, Kan.—My two yearling heifers have teats grown together, caused, I think, by their sucking each other. In other respects the teats are all right. Is there a remedy?

ANS.—If only slightly grown together they may be carefully dissected apart with a sharp knife, and kept apart until healed, by a light bandage around the body with a separate opening for each teat. Slight bleeding may be checked by touching the surface with a stick of lunar caustic or a solution of copper sulphate. While healing apply daily a dressing of vaseline, or an ointment made by mixing equal parts of almond oil and spermaceti. The operation should be performed before the heifer comes in milk.

STERILE COW AND BULL.

M. R. S., Pine Bluff, Ark.—A 10-year-old cow took the bull in Jan. 1885, but she has never since been with calf. She has been in good health all the time and still gives milk; can anything be done for her? A two-year-old grade Jersey bull, well formed and rendering good service apparently, fails to get calves; is he likely to continue worthless?

ANS.—There is probably no cure for either case. Before condemning them, however, it would be well to consult a competent veterinary surgeon, since the cause of the sterility may be removable.

Miscellaneous.

"Hired Man," Kirkland, Ill.—The inquiry about working corn is not one we can answer decisively. The land may or may not have been too wet. Harrowing young corn certainly pulls up many plants, and that's the end of them. If merely broken off, they would continue to grow. We do not think that the soil thrown into the young leaves' "cups" would deprive the plants of any moisture.

R. G. M., Dell Roy, Ohio.—The squash grub borer can be driven away by using a solution of two ounces of saltpeter in 1¼ gallon of water. The liquid is poured around the stem and roots with the double effect of killing the bugs and fertilizing the plants. Soot blown through bellows upon the vine and roots is also recommended. Gypsum and kerosene, in the proportion of two quarts of the former and a tablespoonful of the latter, sprinkled on the vines, will prove effective.

P. S. B., Plainville, N. Y.—What ails my 12-year-old horse? He is in good condition and has always been a good worker; but now, after working well a few hours, he acts as if tired and weak—breathing short and quick. He eats all right, except that he will pull his hay out on the floor and eat with his head down. Slabbers considerably.

ANS.—From your description it is impossible to say definitely. Try turning the horse on pasture for three or four hours daily, or feeding grass, roots or mashes twice daily. Work moderately, and when the animal shows signs of fatigue, take him from the harness and let him rest. For the slabbering examine the teeth to see that none are diseased or decayed. The pulse is normal?

J. C. O., Somerset, Ky.—What is the proper time to cut Clay Cow-peas for fodder and to be plowed under as green manure?

ANS.—The best time to cut Cow peas for fodder is when they are in blossom, or when the blossom is beginning to fade. The plant then contains the largest quantity of nutritous substance, which is chiefly sugar. After this, the soluble carbonaceous matter is converted into indigestible cellulose or woody fiber. As the most benefit from green manuring is derived from its action upon the soil during its decomposition, and the nitrogen it contributes, a green manure crop should be plowed in at the same period as that in which it is most valuable for feeding; viz. when in fullest blossom. This applies to all sorts of green manure crops.

C. C. M., Akron, Ohio.—My six-months-old pig eats heartily, and is all right except that it walks lame and is cross-legged in its front feet; what should be done?

ANS.—Give it two tablespoonfuls of castor oil. Feed sparingly, especially of grain. Green food and milk, with slops from the kitchen, will be good. If convenient turn into a dry, shady yard or field.

G. W. D., Clyde, Texas.—1. There is no way of budding grapes. 2. Grapes that thrive in your section are Concord, Cynthiana, Delaware, Goethe, Herbemont, Lady, Lindley, Martha, Moore's Early, Norton's Virginia, Perkins and Triumph. Agawam, Brighton, Early Victor, Elvira, Hartford, Iona, Ives, Massasoit, Merrimac, Noah, Prentiss do well in parts of Texas.

J. A. W., Maple Grove, Ont., Can.—Personally we know nothing of the Kelsey Japan Plum. Mr. Kelsey of Cal., imported it from Japan, in 1871. It is said to be over-productive, and to bear early. The fruit is large, heart-shaped, yellow and red. It is of good quality. Perhaps Dr. Hoskins, or some of our Canada friends, will tell us as to its hardiness.

J. G., Washington, N. C.—About bagging grapes:—We fancy cloth bags induce mildew Paper bags cost from $1 to $2 per thousand—what are known as two or three-pound bags, as needed. Our experience is to bag when the berries are the size of No. 5 shot.

Subscriber, Buckingham Co., Va.—The plant sent for name is Lithospermum arvense—Corn Gromwell. Native of Europe. Worthless.

J. D. S., Whitewater, Wis.—The plant sent is Orchard Grass—Dactylis glomerata.

DISCUSSION.

M. R. S., PINE BLUFF, ARK.—The RURAL (page 323 in Farmer's Club) says: "The peach tree bears fruit only on the young shoots of the current year's growth." It is evidently meant that the fruit buds were formed on the young shoots.

R. N.-Y. We meant to have written "preceding" instead of "current."

Miscellaneous Advertising.

Dyspepsia

Does not get well of itself; it requires careful, persistent attention and a remedy that will assist nature to throw off the causes and tone up the digestive organs till they perform their duties willingly. Among the agonies experienced by the dyspeptic, are distress before or after eating, loss of appetite, irregularities of the bowels, wind or gas and pain in the stomach, heart-burn, sour stomach, etc., causing mental depression, nervous irritability and sleeplessness. If you are discouraged be of good cheer and try Hood's Sarsaparilla. It has cured hundreds; it will cure you.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

Stock and Poultry.

CHANNEL CAN CREAMERY.

Makes more Butter than any other process. Calls for less labor and ice. Will raise all the cream without ice. Automatic Butter-workers, Churns, etc. One at wholesale. Agents wanted. Send for circulars.

ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JUNE 12, 1886.

By request of the Editor of the R. N.-Y., Henry Stewart will next week begin a short series of articles, entitled "THE DARK SIDE OF FARMING."

IN one row of blackberries, we have the Early Harvest, Taylor's Prolific and Early Cluster. The last (at this time, June 2d) bears the most blossoms—Taylor's next and Early Harvest last. The Early Harvest was more injured by the past Winter than we had supposed.

WE have this season 66 different kinds of strawberries, as stated, growing at the Rural Grounds. Our first lot of ripe fruit was picked from Iron-Clad June 3. The berries are variable in size and shape, but firm and of good quality. The plants are moderately vigorous.

THE pear Duval (Beurré Duval) illustrated on page 383, was sent to us by Gen. Noble, of Connecticut late last Fall. It is a Belgian pear, named after the originator. The tree is vigorous and productive. The fruit is from medium to large; skin yellow, dull brown in the sun, with patches of russet and many brown dots. The flesh is nearly white, juicy, melting, sweet and agreeable. Its season is October.

WHEN corn sets appear, cut out all barren stalks—those which have no sets—and feed them to the farm animals. These barren stalks all bear tassels, and these, just the same as the fertile stalks, mature pollen which is wafted all over the field to mate, so to speak, with females which would otherwise be impregnated with pollen from ear-bearing stalks. In this way the fruitfulness of our corn fields is reduced. If not practicable to cut off the tassels of all the barren stalks in a given field, try it upon a part of the field, and from this the seed corn may be selected for another year. For ten years past we have raised a plot of corn, about a twentieth of an acre in area, for the purpose of ascertaining to what extent prolificacy can be increased by such means. Those who visit the Rural Grounds this Summer may see the results.

THE American Nurserymen's Association needs an energetic man for its Secretary; one who is filled with an appreciation of the good the society can accomplish other than as a mere organization for the sale of nursery stock. We want the society to be a body that will benefit the public as well as the trade. The office of Secretary entails an immense amount of work, and as the pay is trifling, it is hard to select the right man who would be willing to accept of the position. It has been suggested to us that Mr. Herbert Myrick, Editor of the Farm and Home, a young man of good executive ability, untiring energy, and well fitted for the work by education and taste, would be the right man. We hope the position will be tendered to him, and that in view of the value of the services he is capable of rendering, he will accept it.

EVERY farmer should know enough about politics to protect his interests. There is no reason why professional politicians should have a monopoly of the business. Steal the doctor's business by regarding the laws of health. Drive the lawyers out of business by thinking a dozen times before you go to law. Starve the politicians into some honest work by thinking and acting for yourself. Attend all primaries, and do your best to send honest men to represent you. It often happens that one vote at a caucus is worth a dozen at the general election. Whenever voters get careless and negligent, crime is sure to creep into office. The people wait in silence for a time and then rouse, with a mighty effort, and clean the public service. Then after a short period of watchfulness they grow easy again, and the same story is repeated. Let every farmer become a politician on a small scale; know what is going on; keep informed. When a candidate comes about smiling and shaking hands, don't let him take you by the nose and lead you up to the ballot box. He will do it if he can. Understand him, and he never will dare to do it.

HOW BEST TO TREAT THE POTATO BEETLE.

AGAIN some writers are talking of the economy of hand-picking potato beetles. "If this is well attended to, there will be no eggs deposited on the leaves," they say. Do they write from experience, or do they write such stuff because it seems plausible. Years ago, we diligently picked off and killed, once every day, every potato beetle to be seen on a patch 200 feet square, and yet there were, so far as could be judged, just as many eggs deposited and hatched as if this tedious work had never been done; while the soil between the rows was kept hard by being walked over so often. The fact is that the beetles are to be found in every crack of the soil, under little clods and stones, about the stems and creeping everywhere. One may pick off all the beetles from the plants at 10 o'clock, and at 11 they will be as thick as ever. Hand picking destroys just so many beetles certainly and there are just so many less; but it is like removing a mound of earth pebble by pebble, or emptying a tub of water drop by drop. The work has no appreciable effect. We have tried every method of killing potato beetles. For one entire season we tried London-purple, but found that if applied the least bit too strong, it would injure the foliage. Paris-green and water is also injurious to the foliage, because the water collects wherever the leaf will hold it, and evaporates, leaving a film of Paris-green. We now use pure Paris-green and plaster—one pound to a barrel of plaster—and see that it is thoroughly mixed with rake and hoe. The first application is made as soon as the plants get well out of the ground, and the second, when the beetles begin to deposit their eggs, and the third, when the grubs make their appearance. A fourth application is not needed for early potatoes.

PROGRESS OF THE RYE-WHEAT PLANTS.

THE development of the RURAL'S rye-wheat hybrids is far more curious and interesting this season than in any previous year. Those plants which "most resembled rye," as we have designated them, have hitherto varied to a trifling extent as compared with the others, which resembled wheat more than rye. We selected the best heads of the former, as already stated, and planted them in a plot of about one-twentieth of an acre. The heads in shape were rather narrow, tapering, half-bearded—the tops of the stalks of all were downy. It is a matter of very great surprise to us that in this plot there is such a variety of heads that if evidence were suddenly placed before us that all of the varieties of wheat in cultivation sprang from accidental crosses between rye and wheat, we should accept it as in harmony with the appearance of these plants. The down does not appear upon the culms of some, while others are covered more thickly than the parent stems. Some of the heads are beardless, others as much bearded as barley. Some heads are of the shape of Clawson, or the female parent, Armstrong; others are club-headed, with and without beards. Our readers must remember that this twentieth of an acre of plants, so strangely dissimilar, all originated from a *single seed*—one of the ten kernels which four years ago was the result of crossing rye upon wheat. The three-quarters rye-wheat plants (the cross made last year by again using rye pollen upon these hybrids) all differ from one another. There are 14 plants. We shall select some of the best heads and again attempt to cross it with rye, which, if successful, will make the progeny seven-eighths rye. If, as judged by appearances, we were finally to produce rye plants by the continued use of rye pollen, would this prove that wheat and rye were of the same origin?

CAN WHEATS CROSS NATURALLY?

IT has been assumed, and the writer was one to do so, that wheats naturally are invariably self-fertilizing; that the pollen of the three anthers is shed upon the feathery stigma before the anthers push their way between the close-fitting palets or envelops. That this is generally the fact, there can be no doubt. Two years ago we first noticed that these palets gaped open in exceptional cases before the anthers had burst, and the present season we have spent a good deal of time in observing how often and why this occurs. Now and then the top of a spike of wheat will get caught in the sheath or "boot." The head or spike is then bent over—sometimes nearly double—and the flowers are sometimes twisted or bent apart. Insects or birds in some cases injure a flower so that the sexual organs are exposed. Again, a flower will gape open without any cause whatever, that the writer can discover. Some of our rye-wheat hybrids have been and are virtually sterile. Nearly all the flowers open their mouths (so to speak) wide, as if, in their sterility, they were praying for aid to perpetuate their kind. In all these cases (except the impotent hybrids) the pollen ripens as usual, and 99 times in 100 is shed upon the pistils of the open flower. Still, it is conceivable that foreign pollen might be carried by the wind or insects and effect crosses. We are just as positive that such instances rarely occur as that their occurrence is *possible*. The chances of natural crosses are perhaps the same as those of a given house being struck by lightning. This subject has its practical value. We often hear of a new variety having been found in a field of Clawson, Diehl or Mediterranean. Nineteen times out of 20, such novelties prove to be old varieties well known in England, Germany, Russia or elsewhere. But in the twentieth case, the new kind may prove a true, natural cross-bred wheat.

"OLEO" IN THE SENATE.

THE Oleomargarine Bill passed the House on Thursday by a vote of 177 to 99. The party division was: ayes, Democrats, 81; Republicans, 96; nays, Democrats, 84; Republicans, 15. The votes from the New England States were 17 for and 4 against the bill. In the Middle States New York gave 20 yeas, and 7 nays; New Jersey, 4 yeas, 2 nays; Pennsylvania, 20 yeas, 4 nays; Delaware, 1 yea; Maryland, 3 yeas; total, 48 yeas and 13 nays. The Southern States, including Kentucky and West Virginia, gave 21 yeas and 66 nays. The Pacific States gave 7 yeas and 1 nay. The Western States, including Missouri, were the chief supporters of the bill, giving 84 yeas and 15 nays. The tax was reduced from 10 to 5 cents per pound, and the provision giving a moiety of the fine to the informer was stricken out; otherwise the bill remains the same as epitomized by us. Its fate in the Senate will depend chiefly on the committee to which it may be "referred." If referred to the Finance Committee as a revenue measure, it is thought it will be pigeonholed; if to the Agricultural Committee, it will certainly be favorably reported, and if the producers and eaters of genuine butter act energetically it will probably pass. But will the President sign it?

ONE point about the bill should not be overlooked. It has served to illustrate the possible strength of the farmers of this country as nothing has ever done before. Petitions and resolutions by the thousand have been poured in upon Congress and many a vote has been influenced by this popular demonstration. For years it has been considered the thing to advise farmers to "combine" and to demand their rights. The loudest shouters have very carefully neglected to inform the public how these "combinations" were to be made. To our mind the recent postal bill and the present oleomargarine bill have given farmers the most practical chance of asserting their rights that they have had in years. City Congressmen can afford to snap their fingers at the petitions of farmers, but the great majority of our legislators are created by farmers' votes, and they have common sense enough to understand it. For this reason we advised every cow owner and every butter eater to take a hand in the "oleo" discussion. We are glad to see that our remarks were so well heeded. Let the good work continue. Your Congressmen is not a bigger man than you are—you made him. We are getting into practice, friends, and "practice makes perfect,"

OUR SCHOOLS.

IN many places, much dissatisfaction exists with the present system of public education. In too many country school districts the course of education is almost a farce. A new teacher comes with every term, the school officials take little or no interest in the school, and the ill-feeling and animosity that exist between various families in the district are brought into the school-room. These failures should not be. The country school ought to do better work than the city school. In good districts where sensible and liberal-minded men are put on the school board, and where all take an interest, a school is maintained that is a credit to the community. Such a school not only tends to create a sound public sentiment, but it enhances the value of property. The old practice of electing the last man to move into the neighborhood, to any vacant position on the school board, is still in vogue in many districts, and a more ridiculous proceeding is hard to imagine. Too many of our town and city schools fall into the management of politicians, and favoritism is rampant in the selection of teachers. The average country teacher works simply to secure his wages. Unless he is watched and directed, there will be few grains of wisdom for the pupils. The average city teacher is generally a person who would be a most complete failure in any other branch of business. He seems to go upon the principle that all his pupils are to become teachers. In fact, he is only capable of teaching his trade just as the carpenter and the blacksmith would teach their trades. It is beginning to be generally felt by all, except professional teachers, that there are too much system and form and worthless routine about the common school education. This fact is evidenced by the fact that in all large places private schools are increasing in size and number. Many practical people are in favor of conducting our city schools in connection with workshops or places where pupils could learn the rudiments of business. The design is to shorten the hours of study, and put more time to practical work. It is justly claimed that the average workman seldom receives an adequate return for the time spent at school in studying geography or "language." When so many millions are devoted each year to the cause of education, it may be well to see if this education cannot be improved upon. Country schools can be the most easily and quickly improved of any. Every resident of a district should feel an interest in school matters, and do his best to rectify existing evils.

BREVITIES.

OUR first ripe strawberries for this season were found upon the Iron-clad. But there are better kinds.

A FARMER near the RURAL'S Ex. Grounds, has lost 130 chicks out of 150 with gapes. He can't account for it.

THE Convention of the American Nurserymen's Association will be held in Washington, D. C., June 16–18, inclusive.

THERE are this season 66 different kinds of new strawberries growing at the Rural Grounds. We have had as many as 110.

NEVER before have potatoes at this day (June 1st) been so far advanced. The season has been very favorable. The experiments with different chemical fertilizers and all sorts of combinations thereof promise to confirm the interesting results of two years ago.

The Bangor Blackberry (new), a semi-recumbent variety, is blooming freely from spring-set plants. The Earhart Raspberry, the plants set in November of last year are full of sets. We are in hopes this variety, for which so much has been claimed, will not disappoint those who purchase it.

THE summer meeting of the Michigan State Horticultural Society will convene at Lansing, on the evening of June 15, at 7:30—headquarters Hudson House. The topics to be considered will cover small fruits. The meeting will continue through the next day, closing with an evening session.

READERS of the RURAL will recall that we have repeatedly and earnestly tried to guard them against selecting the Norway Spruce and Balsam Fir for their lawns or farms. Prof. Sargent says, and we have no better authority, that "the Norway Spruce, in spite of its early promise, must be acknowledged to be a complete failure in Eastern America." And the Balsam is worse.

AFTER all, the worst of the striped melon beetle is that it lays its eggs upon the stems of melons, squashes, cucumbers, etc., and the grub which hatches out eats into the stems and our plants all at once die. Nothing better than pouring a small quantity of the kerosene emulsion about the stems of the plants to keep the beetles away has been devised.

A SUBSCRIBER favors us with the following remarkable bit of rhyme:

"O say do you see by the dawn's early light,
The crow in the corn field appearing,
Where the wire-worm has been gnawing through the long stilly night,
And the gopher his head is uprearing;
While the chipmunk comes out from the old rotten stumps
And the cut-worms so festive the blades are a-climbing,
And the blackbirds all gathered in the poplars near by,
While their notes are a-chiming;
Yet in Autumn the corn stalk in triumph shall wave,
O'er the field of the free, and the land of the brave."

A COTTON-PICKER has at last been invented which appears to promise fair results. It is in the form of a bulky box filled with revolving spindles or picker stems. The machine is driven directly over the rows, and the lint catches upon the spindles, and is thus drawn from the stalks. It is thought that some 75 per cent. of the lint can be thus gathered; what remains on the stalks must, of course, be picked by hand. A successful cotton-picking machine means a revolution in cotton culture at the South. At present the planter is at the mercy of his laborers. With a successful picker the work could be brought into the hands of a few trusty workmen. Quicker and more economical methods of planting and cultivating the crop will be adopted. The vast army of negroes and poor whites who now live on the cotton fields will be forced out of employment, and made to adopt some other work and a more diversified farming system.

The Herdsman.

JERSEY COW TINY.

THE animal shown at Fig. 153 won the gold medal at the show of the British Dairy Farmers' Association in 1885. She is a dark gray, and was calved in February, 1878. She produced a calf on June 5th, 1884, and was in milk for 44 weeks three days, when she gave 8,957 pounds of milk (10 pounds to the gallon). She calved again on May 30th, 1885, and was in milk 44 weeks five days, yielding 8,172 pounds of milk. During this latter period, she made three journeys—to Southampton, to the Royal Counties Show, where she was highly commended; to Tunbridge Wells Show, where she was also highly commended; and in October to the London Dairy Show, where she took the gold medal of the English Jersey Herd Society and second prize of the Dairy Farmers' Association, the first going to an Island-bred cow. She was in equal milking form when she had this her sixth calf, and it is believed she would have equaled or exceeded her former yield then, but her three journeys from home were much against her. She fell off nearly two quarts in her daily milking at Southampton, about a quart at Tunbridge Wells, and at the London Dairy Show nearly two quarts.

AYRSHIRE CATTLE.

I AM often asked why I keep Ayrshire cows, when other breeds are more fashionable. Now I am located in that region in Michigan where every inch of ground not under tillage, soon becomes thickly sodded with Kentucky Blue Grass. Even the wood lots will ultimately become sodded with it. All who know its habits have learned that it affords an abundance of excellent pasture, but is "short-biting." My cattle run in the wood and fallow pasture till after haying, and find good eating.

One acre of clean sod will furnish pasture for one cow during the Spring and early Summer, if she has the ability to eat every bit of it. To this work the Ayrshire is well adapted. I have only grades, but find them hardy, healthy, and profitable. They will, like a mule, eat any thing that ever bore a green leaf. They respond liberally to good care and feed; and, if not fashionable, they possess many sterling qualities for which they are appreciated. I know of no breed that will graze over so large a range and do so well on the short grass that here springs "unbidden" from the ground. All breeds have their good points, Ayrshires with the rest. They cannot be turned off for beef at so early an age as can the beef breeds; but they are fairly profitable for that purpose. Their fat, like that of all other dairy breeds, is laid on in the inside, and they dress better than their looks indicate. Ill health and accidents are seldom heard of among Ayrshires. At this season my little herd, two-thirds of which are heifers or farrow cows, are making a pound of butter apiece daily on pasture alone. They are one-half and three-fourths grades, and make nearly double what natives did under like conditions. The herd has not yet been improved by selection. Ayrshires may be set down as being among cattle what mules are to horses—born into the world without their knowledge or consent, and determined to stay here till old age takes them off. Let each one study his own circumstances and choose accordingly from among the many breeds, not to please some pet theorist who has pedigrees to sell. EUGENE DAVENPORT.

Barry Co., Mich.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

KALAMAZOO CELERY.—A pamphlet of 30 pages from G. Bochove & Bro., Kalamazoo, Michigan, price 50 cents.—Kalamazoo celery is famous, not perhaps as is stated in this pamphlet, "through the inhabited portion of the earth," but throughout a large portion of our own country. The object of this pamphlet is to give, in a few words, the methods of cultivation and care that have led to this reputation. The work is well done. There is not a superfluous word in the pamphlet, and yet the facts are all given, from the selection of the soil, to the marketing of the crop. A mucky soil is preferred. Around Kalamazoo the muck has a depth of from one to ten feet. The people engaged in the cultivation of the plant at Kalamazoo are mostly Hollanders. As a rule each family works from two to three acres. The land is drained by open ditches two or three feet deep, one foot wide at bottom and three feet wide at top. With this slope, the freezing and thawing of Winter will not break down the sides. Celery is of no better quality for deep drainage. On some of the best celery land the crop grows within 18 inches of standing water. If the plant itself is covered with water for two days, however, it will be destroyed. The ditches are placed from three to five rods apart. They are dug in the Fall with spade or plow. On very soft land wooden shoes six or eight inches in diameter are placed on the horses' feet. Well rotted stable manure is used, a layer about two inches thick being plowed or harrowed in. One ounce of seed will give from 5,000 to 10,000 plants. For the early crop the seeds are sown in the hot-bed in March and transplanted in late May or early June. This crop is sold during July and August. Too early sowing is said to cause the plants to run to seed, making them tough. For the main crop the seed is sown at intervals of every few days from April 20 to May 20. The seeds are sown broadcast in small beds in the mellowest and best pulverized spot to be found. When the plants are about two inches high, transplanting begins. This must be done on a cloudy day or late in the afternoon. The plants are set five inches apart. The leaves and points of the roots are cut off. When the sun shines, no watering is done before 4 P. M. Rows are placed from three to four feet apart according to the time desired for marketing. If for winter use the rows are close together. The dwarf varieties are mostly raised. Some lands are able to produce three crops in one season. Blanching is done with muck or with boards. In the first instance the soil is drawn towards, but not against the celery. The leaves are then lifted and straigthened and the ground pressed to the celery with the hands. No dirt should fall into the heart of the plant. About five days after the first cutting, more muck is drawn towards the plant—almost to the leaves. Two men are required to blanch with boards. The boards are from 10 to 12 inches wide, one inch thick, 15 to 18 feet long, and free from holes. These boards are placed on both sides of the rows, close up to the plants. Earth is drawn up to the bottom of the boards, while at the top they are fastened with wire or notched pieces of wood. The boards are left about two-and-a-half inches apart. Blanching requires from 10 to 20 day. The celery is stored in "coops" or in trenches.

FARMING IMPLEMENTS.—Catalogue from the Ames Plow Company, Quincy Hall, Boston, Mass.—Our readers need no introduction to this company. Any man who has ever handled a hoe or a shovel has read their advertisement on his implement. It is useless to say that the company is one of the most reliable in the world, and that its implements are in every respect first-class. Almost every known agricultural implement is manufactured by this company. All are well described in the catalogue. We call particular attention to the "American" Hay Tedder. The practice of "tedding" or turning hay by machinery is becoming more general, even upon the smaller farms. Where a large amount of hay is to be secured, the tedder is considered an indispensable piece of machinery. The great object in hay making is to shorten the time between cutting and stacking as much as possible. A drying wind is almost as effective an agent in curing hay as is the sun itself. Tossing or lightening the swaths admits the air and sunshine more freely. By the aid of a tedder, a horse can do the work that formerly required half a dozen men and boys. The American Tedder has been thoroughly tested, and has given universal satisfaction. It is simple and easy of draft. It has won many first premiums, and is highly recommended by hundreds of practical farmers. Send for the catalogue.

UNION WIND-MILL AND MANUFACTURING Co. T. H. Loomis, General Eastern Agent, 11 Caledonia Avenue, Rochester, N. Y., or Union Wind-Mill Co., Albion, Michigan.—An illustrated catalogue of Wolcott's Wind-Mill, Feed Mills, Corn Shellers, Stalk Cutters, Wood Saws, Pumps, Tanks, and fixtures for farms, railway, village and ornamental purposes. Our friends must send for this catalogue if they would learn the particulars of the goods manufactured by this firm. The Wolcott Wind Mill is known to do good work in all kinds of weather. It is one of the best self-regulating mills made; its construction is of the simplest and it is therefore durable. It is claimed, also, that this wind-mill presents a greater surface to the wind than any other. It is designed to work at the same rate of speed in light as well as in strong winds. The Company agrees to furnish, free of charge, any part or parts necessary to make good any defect in workmanship or material used for one year. The company's Geared Power Mills for grinding feed, shelling corn, sawing wood, churning, elevating grain, etc., are highly praised.

FIELD FORCE AND LIFT PUMPS.—Catalogue from the Field Force Pump Co., Lockport, N. Y.—It pays to spray orchards with a poisonous mixture of Paris-green or London, purple. That point has been fully decided. Few fruit growers would think of raising a fair crop without the aid of these poisons. As stated by us last year, we do not know of any force pump of equal price, that will do better work than the Field. It is particularly well adapted to orchard work, being strong, simple and easily handled. We advise all who are desirous of obtaining a pump of this character to send for this catalogue and study it. The information contained in it regarding the destruction of insect pests will far more than repay the writer's trouble.

SIXTH ANNUAL REPORT of the New Jersey State Ag. Ex. Station, New Brunswick, New Jersey, Prof. Geo. H. Cook, Director.—The Station has analyzed 239 samples of fertilizers, the list, with the manufacturers' names and guarantees appearing in full. There is a fund of information in this work for all who choose to study chemical fertilizers. Field experiments of many different kinds, feeding systems, feeds and fodders, reports on vineyards, sweet potatoes, sorghum, peach trees, etc., etc., are presented in an instructive way. We shall endeavor to quote from this Report at an early day, for the benefit of those readers who may not procure the entire Report.

JERSEY COW, TINY. Fig. 252. Re-engraved from the London Live Stock Journal.

TOBACCO SMOKE FOR GAPES.

A sure cure for gapes in poultry I have found in tobacco smoke. After having spent hours each day fishing worms from the throats of hundreds of chickens with horse hairs, Timothy heads, and feathers, I found tobacco smoke much more effectual and infinitely less troublesome. Place the affected chicks in a box with the lid on top and an open space on one side for the entire length of the box for ventilation and feed and water. Fill a large pipe with tobacco, light it, place a piece of muslin over the bowl, and blow the smoke into the box until the chicks begin to settle down. Be sure they do not smother. Repeat the operation two or three times; then cover them with a cloth. Three such performances, in 24 hours will almost always effect a cure. Keep them the entire time in the box, feeding and watering them from the outside. The entire litter should be smoked as soon as one is noticed scratching its noze or sneezing. A small-sized bee smoker is useful for those who cannot stand tobacco smoke themselves. W. H. B.

Dover, N. J.

[This is essentially Col. Curtis's method given in these columns several years ago.—EDS.]

TWO NEW GRAPES.

Mr. Wm. E. Green, of Vermont, originator of the Vergennes Grape, has originated a new variety called Early Delmonico. It resembles the Brighton. He says it is the earliest grape he knows of, and that it is superior to the Vergennes or Brighton. He also has a new black grape, called Montreal, that is superior to the Concord. O. H. ALEXANDER.

A VOICE FROM TEXAS.

The strikes ought to teach us lessons in political economy. It is high time we began to study the labor question. The distribution of labor lies at the very root of the matter. We can only wonder why so many people of moderate means persist in living in the cities when Nature has so lavishly provided for their maintenance and independence in the country. Sober and industrious persons could easily make homes here. Our large ranch owners are ready to help parties with small means to invest, by giving them an interest in their herds and helping them to a home. The trouble is that people want too much. They expect to come here with nothing, and in a few years to go back to their old homes and buy and sell all their old neighbors. This cannot be done in this age, and, consequently, many become discouraged and will not half try. The only successful immigrant is he who goes "for good," determined to cut away from the old home entirely and to build a new one. Would that thousands of the poor city people could be induced to settle here! I do not suppose they ever will. Country people move to the city far oftener than city people move to the country. T. H.

Comfort, Texas.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

OUR BABY.

WHAT is most like her, our baby sweet?
Strayed from the skies on yester-even,
So newly come that her dimpled feet
Still are missed in the gate of Heaven,
Where the angels kissed them and bade them go.
What is most like her? Don't you know?

The bud of a rose, of a moss rose fair,
Flushed and dainty, a folded flower,
The blossom a woman is fain to wear
Over the heart. May sun and shower
Brim her cup to the overflow
With dewy perfumes, if this be so!

Or call her rather a nestling dove,
That fluttered down through the moonlight amber,
To be brooded under the wings of love,
Here in a hushed and happy chamber.
May never a stain of our earth below
Dim her plumage, if this be so!

Or else I deem her a spellbound lute,
Unconscious yet of her songful mission,
The silver melodies sealed and mute,
Waiting the breath of the sweet musician,
Even of life. May grief and woe
Melt in her music, if this be so!

I liken her unto a pearl—a pearl
From seas of trouble. But whist, my numbers
What strains are these for our baby-girl,
Shut like a star in a mist of slumbers?
They vex her dreams with their tuneless flow;
She heard the angels a night ago.

—*Katharine Lee Bates, in Sunday World.*

OF INTEREST TO WOMEN.

A NOVELTY is the Mikado handkerchief of fine linen with hair-line plaid of many colors. It has a hemstitched border edged with lace.

Miss Catherine L. Wolf, of New York, who spends much of her immense wealth in unostentatious charity, has recently presented a

church, costing $45,000 to the Italian Mission of the Episcopal Church in New York.

This season fashionable girls have been seized with a craze for donkey carts, that unassuming but determined animal having come into style. The fancy is for a white one, which is handsome, but difficult to obtain. Of course, these donkeys are more expensive here than in England, where a good animal may be purchased for two pounds.

The daily papers are filled with glowing accounts of the fame and fortune awaiting energetic women in the far west. We are told that they may take up Government lands and rapidly attain wealth by sheep or cattle raising; while in the towns and villages they may make money quickly by their knowledge of music and art. We should like to hear something more of this from our Western RURAL sisters.

Scrap jars made of birch bark are to be seen at a New York bazar famous for its decorative novelties. The foundation is a cylindrical box about two feet high and 10 or 12 inches in diameter. This is smoothly covered with the satiny bark; around the top a slender spray of the birch forms a heading. On one side is a big bunchy bow of peacock blue and dull orange ribbon, having a spray of artificial fruit or filigrette flowers twisted amongst it. These filigrette ornaments look like skeletonized flowers or leaves of tinsel, and are very effective in decoration.

Charming pongee tidies are decorated with a combination of painting and embroidery. An outline design of wild roses being chosen, it may be worked in silk, the stems and leaves shaded green, the flowers rose-pink. Then these outlines may be filled in with water colors of appropriate hue. It is extremely easy work, and charming in effect.

A Fourteenth St. bric-a-brac store recently displayed a quantity of pretty little ornaments in Derbyshire spar. This substance, which may be unfamiliar to many, is an earthy crystal, appearing in delicate shades of cream and pink. It is common throughout the Peak of Derbyshire, a picturesque district much affected by tourists, who are great purchasers of these local souvenirs.

Relative to women's work, Ruskin says: "You may see continually girls who have never been taught to do a useful thing thoroughly; who cannot sew, who cannot cook, who cannot cast an account nor prepare a medicine, whose whole life has been passed either in play or in pride. You will find girls like these, when they are earnest-hearted, cast all their innate passion of religious spirit, which was meant by God to support them through the irksomeness of daily toil into grievous and vain meditation over the meaning of the great book, of which no syllable was ever yet to be understood but through a deed; all the instinctive wisdom, and mercy of their womanhood made vain, and the glory of their pure consciences warped into fruitless agony concerning questions, which the laws of common serviceable life would have either solved for them in an instant, or kept out of their way.

Give such a girl any true work, that will make her active in the dawn and weary at night, with the consciousness that her fellow-creatures have indeed, been the better for her day, and the powerless sorrow of her enthusiasm will transform itself into a majesty of radiant and beneficient peace."

CHIPS FROM A COUNTRY WORK SHOP.

WHAT a lot of philosophy there is in just letting things slide! We need not be lazy or slatternly about it either, but let things slide from a high moral standpoint. I mean this—we should not bother our heads and bodies too with vexatious superfluities, a very common failing with ambitious housekeepers. We needn't put 17 tucks and a frill on our small daughter's frock, just because her playmate has as many, when every extra tuck means a nail in the tired mother's coffin, to use a homely old saw.

We need not be ambitious to set before our guests three kinds of cake and puffy hot biscuits, presided over by a hostess too tired and heated to do more for entertainment than to press on her guests the material comforts for which she sacrificed the very spirit of hospitality. It is the true essence of hospitality to offer mere bread and salt in the spirit of genuine welcome. We must offer the refreshment of the spirit, the rest we may buy at an inn.

What a lot of superfluous cares we are apt to create through our anxiety to please our guests! Here is another direction in which to let things slide. Do not think I mean that we should be slip-shod in our hospitality. No; I mean that we should so live that "company manners" are a thing unknown—it will very materially simplify matters. This is especially true in all things connected with the table. If the meals are prepared and put upon the table with all things done decently and in order, while the olive branches are from the first instructed in table manners, the hostess is not likely to be annoyed by any unlucky *contretemps* when guests are present. A very useful little work for such instructions is "Don't: A Manual of Improprieties in Conduct and Speech." In alluding to the philosophy of letting things slide, we must not forget another valuable preventive of social friction, and that is, looking at life and its mishaps from a humorous standpoint. It does not imply making fun of serious things, but making high comedy of life, as Horace Walpole says. Really, we should live a good deal longer if, like Mark Tapley, we could be jolly under a variety of circumstances. So, if you have a keen sense of humor, cherish it as your most valued friend; if not, try to cultivate it, for it forms a sovereign shield against the blows of adverse fate. E. T. LYNN.

THE READING OF HISTORY.

HOLLY DEAN.

IN a previous article we have attempted to show, that home study is not a mere myth, but on the other hand may be made productive of most excellent results. In the present instance we shall present something in the way of illustration, and suggest the way in which these general principles may be applied. An eminent educator was recently asked the question: "How shall we read?" and in reply gave it as his opinion, that no general rule was possible, but that this was on a par with the equally unanswerable question; "How shall we breathe?" There is some truth in this observation, and yet experience gives us certain general rules, which are applicable in all cases. First, in choosing *what* to read, we must remember that we cannot read everything, and that this, even were it possible, would hardly be desirable. Much is written now-a-days, which is far from profitable reading. Never before has the literary market been so full of works, good, bad and indifferent and a nice discrimination has been never more necessary than now. But even when we have drawn in the over-full literary net, and cast the bad away, we find our mental fish baskets too small to contain the residue, and are so forced to make a second division.

Our subject leads us away from the wide and interesting field of fiction, and remands our attention to the question of historical reading. Its value as a means of culture is undoubted, and we only need to inquire, how a person with limited time, and small purse may be able to utilize this means of culture in the best possible way. History is the most accessible branch of study, open to those who are deprived of the benefits of instruction. Scientific works are largely obscured by a terminology peculiar to themselves, and this terminology must first be mastered before we can make any great progress. Languages may be studied in private with great advantage, and yet, an imperfect rudimentary knowledge of the rules of languages in general, may cause the home student much perplexing and discouraging trouble and delay. But history may be read and studied by any who can read at all, and forms an excellent preparation for more difficult work to follow. A year's course in some line of historical reading must result in the gaining of much useful, and practical knowledge, and even though the time devoted to the work each day is small, especially during the summer season, a single fact secured daily and thought upon in its several relations sufficiently compensates for the time and trouble bestowed. We must guard against two extremes, i. e., grasping too much and laying hold of little, or nothing. If we run over a large territory, and retain little or nothing of what we have read, the results are to say the least unsatisfactory. On the other hand, if we confine ourselves to the acquirement of the names of a few persons and places, and the dates of a few chief events, we have come far short of the true aim of historical study; we have laid a foundation, but reared no superstructure upon it. This calls to our notice another frequent cause of failure in this direction. The rule of progressive knowledge is "branch out," instead of this, some persons are under the constant necessity of branching in. Their progress may be compared to that of a ship, which, having proceeded a certain distance from a known point, is forced again to return to that point in order to "take bearings," and a second time start from the same place to go a little farther than before and again return.

It is good for a traveler in a strange country to make himself familiar with the road along which he is passing, as otherwise he may easily lose himself, and the same advice is applicable to the mental traveler, who enters an unexplored region. Be sure you know where you are, and then go forward always keeping your eye on some familiar landmark. Who can thoroughly enjoy Carlyle's admirable History of the French Revolution, without first thoroughly learning the facts connected with the event from some other source? Such writers presuppose this rudimentary knowledge, and proceed at once to their discussion in detail. Whatever line of historical reading you choose to pursue, first acquaint youself with the outlines. Construct a skeleton first, and then clothe it with flesh, and it at once becomes to you a thing of life.

History is a broad subject, and it is generally best to begin "near home," and gradually widen our circle of investigation. Some knowledge of our own national history is first essential. A brief and, at the same time, comprehensive American history is a *desideratum*, which genius and labor has yet to produce. Barnes' Brief History is a fair outline; Quackenbos' a little more full and certainly more interesting, while for those who desire to pursue the subject in detail, Bancroft's, when accessible, is the undoubted standard. The history of England is intimately connected with that of our own country. "English History" in the Chatauqua text books is an admirable little compendium of dates and events, and may be purchased at the price of a dime novel. By committing to memory the 50 small pages therein contained, we have constructed a good, firm foundation for subsequent reading. Dickens' Child's History, though sometimes inaccurate, is written in the genial, pleasing style characteristic of the author, and deserves a careful reading. After this, we have a wide field from which to choose. Many have here done yeoman service in recording the history of their country. Green's Short History has much to commend it to the general reader. It covers the whole period, is accurate, and constructed on a new plan, striving to present rather a history of the people than a mere detail of wars and political intrigues. Every person of liberal culture aspires to read Macaulay, and we cannot well afford to omit it from our list.

After this course, we are well qualified to read anything in the way of English history, and may pursue Hume, Lingard, and Hallam at pleasure. A general outline of universal history is a proper preliminary to further reading. Anderson, Willard and Lardner have each produced such sketches, of which the respective value is indicated by the order in which they are placed. Gibbon's decline and fall of the Roman Empire covers a field of history, occupied by no other writer. A careful reading of some small history of Rome, such as that of Smith or Liddell should precede the perusal of this more extensive work, which may really be considered as a general history of the period, of which it treats. Space does not admit the further specification of particular lines of historical reading. We close the article with one general suggestion in regard to the use of note books. These aids to the memory, are nowhere more profitably employed than here. By judicious use of pencil and paper, it is possible to compress a chapter of Hume or Macaulay into the limits of a few closely written lines, and so arranged that a reference to these notes recalls much that has not been written. Aside from this, the practice of condensing thought into the fewest possible words is acquired, and in this form, facts are most readily retained, and easily utilized. Question books may either accompany or partially take the place of note books. In these, questions are written out, the answers to which include the statement of facts, especially important in their bearing on the general subject. In either case, the same caution is necessary. Do not try to make a note book a transcript of the printed page. In this case, much time is lost, and, besides, nearly all the benefit derived from judicious note-taking. Make your notes few and brief, and as far as possible suggestive. A couple of lines will often recall a five-page argument. Review your note-book frequently. Do not think that when written full, its usefulness is past, and therefore consign it to the waste basket. Mark each book with the subject on which it is made, and lay it away for future reference. Well preserved and carefully written note-books form a library in miniature, and are especially valuable, when the book on which they are made, happens to be a borrowed one, and when once read passes out of your hands. Much more might be said on this point, and on the general subject, but what has been written has been presented with the especial view of aiding the unaided efforts of those who may chance to read this article. In this way many hours may be profitably and pleasantly employed, which would otherwise be devoted to trashy reading, or wasted in idleness or frivolous amusements, and a store of useful knowledge accumulated, which will prove of lasting benefit to the possessor.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

PITHS.

VARNISHED furniture should not be wiped off with a *damp* cloth.

If you do not possess a carpet sweeper, insist upon having one.

When sweeping, open such windows and doors as will create a draught, that the dust may be carried off instead of settling again upon carpet and furniture.

Soiled clothing, particularly that which is damp with perspiration, should never be thrown into a dark, non-ventilated closet and there left until washday.

If you would rob ironing day of a part of its terrors, provide yourself with good, steel-faced flat-irons and then keep them, when not in use, in a dry place wrapped in thick, brown paper.

Water that has boiled for any length of time will not make a good cup of tea. Put fresh water over the fire, heat to boiling and turn at once onto the leaves. Let stand where it will keep hot, but not boil, for five minutes and serve. Long boiled tea is always suggestive of "yarbs."

We have seen a fretful baby quieted by giving it a few teaspoonfuls of cold water.

Cut waist linings *across* not lengthwise of the goods—this to avoid stretching—and silesia makes a much better lining than drilling.

HOUSEKEEPING IN CALIFORNIA.—VIII

MARY WAGER-FISHER.

WHILE visiting the Citrus fair in San Francisco in January, a man who was one of the exhibitors, and who had a ranch of 900 acres near Sacramento, was moved to tell me something about himself and his family, with which I was greatly entertained. He was a a son of John Bull, a solidly built man, not tall, but very snug and compact in figure, and looked the picture of health and strength. He was greatly interested in olives, and treated us to olives ripe and fresh, and olives pickled—the latter having been soaked in lye, and then when reduced to a pale green color, put in slightly salted water. He declared that his family lived well on simply dry bread and olives of which the children—he had five girls and a boy or two, but only the girls seemed to be of special account—were very fond. The oil in the olives made meat dispensable.

He thought his girls, girls worth talking about! One of them 10 years old, rode to school on horse back, a distance of two miles, and in addition, would, for a week at a time, pump water for 75 head of stock. Another daughter of 14 years, would carry a sack of flour weighing from 120 to 130 pounds up-stairs and think nothing of the feat. He never yet sent her in the meadows to catch a horse that she failed to catch, and he had always found girls more reliable than boys! She took entire charge of a stallion weighing 1,200 pounds, would make him lie down and get up at her bidding, and she would sit on him when lying down and read a newspaper with as much unconcern as if sitting on a stump. But she didn't play the "pianner" however, she wanted to learn, and in exchange for music lessons she would teach one how to feed and water, to clean off and bed a horse, to bridle and harness it, and make any horse gentle as a lamb. She would hitch one horse on one side of the tongue of a big wagon and make him draw it; all his girls rode on horse back, but astride. He thought it most ridiculous and absurd for girls, or women, to hang themselves on the side of a horse, and would I not do all I could to encourage astride riding? I assured him that I had always believed in women riding as did Queen Elizabeth, and that if I had daughters to ride on horse back they should all ride astride.

He said there was a great deal of nonsense talked about what one should eat and drink. He himself had not drunk tea or coffee for 40 years—water was quite good enough for him—and his wife had drunk neither for 20 years. They were never sick at his house. One time just to "experiment," he had gone without food for five days, and worked every day. Another time for weeks, he had worked in a printing office, and lived on 35 cents a week. "And did you keep well?" I asked, "Just as well as I am now!" Still another time for a period, he lived entirely on animal food, and an equal length of time entirely on vegetable food, and was just as well and strong on the vegetable diet, as on the meat food, and he could at any time carry a sack of flour in his teeth. But there was nothing like olives for dyspepsia—sure cure. His 14-year old girl, furthermore, would ride 40 miles in a half day, on horse back and think nothing of it, and take care of 100 head of horses. I might have questioned his veracity as to his wonderful girls, but I heard from another source of their extraordinary doings with horses.

This Anglo-American has lived in the United States 34 years, is now 59 years of age, looks ten years younger. He told me also of another girl—a young woman who came to California from Illinois hoping to find a school to teach. But meantime she must do something, and he hired her at $12 a month to work on his farm. She, too, understood horses and was not afraid of work, and she would harrow with a double team, as well as a man. She got a teaching certificate finally, and the school directors declared that any woman who could harrow a field as did she could teach a school, and so they hired her at a salary of $80 the month. She was a good teacher and was doing splendidly until a fellow came along and wanted to marry her. My informant said he advised her to have nothing to do with him; that she

know nothing of his antecedants—"but although she was a girl of downright good sense," he explained, "like so many other women, it seems to be their failin'. You couldn't make her cautions as to marrying, and she married. Then she tried to get him elected school superintendent. I told her it was no use, and it wasn't; and she paid his whiskey bills, and he not only used up all her money, but beat and misused her; that smart girl that might have lathered him well if she had set about it. But she didn't, and I guess if her father hadn't come on and took her away, that she would have gone on submittin' and died of a broken heart. And just as I had hinted to her, the fellow had a wife when she married him. He had left number one up in Washington Territory, and the poor thing followed him down here, coming in a lumber schooner, stowed away with her three-months' old baby in the hold like a piece of wood! And after number two left him he married still again!"

"That's the California way, is it?" I observed.

"Yes, it's the California way! Marry as many times as you can; and it's an awful good place to get crazy in; the lunatic asylums are just running over!"

"But you like it here?"

"Oh yes, I like it. When I look around on this show, all these oranges and lemons and pomegranates and olives and posies, I just wish that my father could take a look at it all. I've got his picture—taken 50 years ago when he was 50—and I've just a mind to bring it here and let him take a look around! Do you think there would be any harm in that?"

Girls generally in the country in California ride much on horseback, and in the towns drive a great deal, and seem to be accustomed to horses. And women, for the larger part, have the Boston fever of work. They all want to learn some trade, or acquire some vocation by which they can earn money, for the time has come when money is no more plentiful here than elsewhere. The girls learn typewriting, shorthand—are not so much employed as dry goods clerks—but very generally as teachers, and many married women with grown families engage in teaching. Single women object to this, as they contend that when a woman is married, it is the business of her husband to support her—as it is—only no husband "supports" his wife any more than he supports his hired man or clerk—and the mutual support comes just as much from her as from him. Everybody complains of the incessant drive of California life; owing to the climate, there is no specially dull season in trade or business, no getting away during the heats of Summer as in the East, or of rest for farmers in the Winter, no time when one can take a holiday better than at another, which is one explanation why business men break down and get into the insane asylum. Still, among agriculturists, there is a good deal of the *laissez aller*, and a large proportion of them haven't as yet caught the "Boston fever."

DISH DRAINER.

FIG. 253 shows a rack for drying dishes, the use of which will reduce the work of dish washing at least one-third. The dishes are washed clean, rinsed in warm or hot water and placed edgewise in the rack. In 15 min-

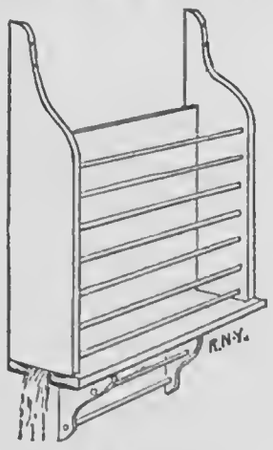

Fig. 253.

utes they will be found dry and shining. The end boards are 25x11 inches, one-and-a-fourth inch thick and curved at top for fastening to wall. The bottom is of one-and-a-half inch board 24x11 inches. This is nailed to sides so as to allow of one-half inch slope. It is slightly hollowed in center the entire length and extends a little beyond end to allow of water passing off freely. The back is of one-and-a-fourth inch board carried up to curve in sides. Inch rods are fastened securely in sides to hold dishes in place. The rack is secured to wall by screws at top and supported at bottom by wooden bracket-like pieces. Two or three rods can be fastened to these supports, as seen in cut, and are very convenient for hanging the drying towels upon.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

LEMONS.

MANY people know the value of lemon juice in allaying bilious troubles. Many know nothing of the wonderful power wrapped up in the little yellow fruit, for the good lemon juice has done is wonderful—as wonderful as it is harmless and simple. A lady who had suffered greatly with severe attacks of something akin to bilious colic, keeps free from them as long as she faithfully takes lemon juice. Let her, through "feeling so well," neglect to take the juice of at least one lemon a day, and in a short time symptoms of the return of the old enemy will make her only too glad to be faithful over that little thing. For several years, this lady had been subject to these attacks, at times so severe as to indicate gallstones. No care of diet or druggist's doses averted them, and hope of relief was nearly gone, when a friend said, "You crave sour—why not try lemon juice and water? Dr. Somebody says a person need never be bilious who will take the juice of one lemon in water every night before retiring." Catching at this straw, the lemons were tried, and the juice in water, *without sugar*, was freely drank whenever thirsty, and always the last thing at night. One slight attack of the old trouble proved that the remedy was doing a good work, and after that, complete exemption for more than a year, makes her an ardent advocate of lemon juice and water. Sick headaches yield in many cases to this simple treatment. Some cannot bear the acid, but those who crave it are very sure to be benefited by its use.

S. E. H.

RAG DOOR MAT.

IN these days of cheap carpets one often wonders what to do with the old clothes we used to make rag carpets out of. I have found a way to make use of "men's old cassimere clothes." Make a large crochet needle out of green hickory, then cut the cloth in narrow stripes and sew it together as for carpet rags—the light and dark separately. Commence with the dark, knit a chain a quarter of a yard long, throw the cloth over the needle and knit around the chain with a plain stitch widening at each corner until the rug is three-quarters of a yard long. Then join the light cloth, and knit two rows, then two of dark, two of light and finish with two of the dark. If you will follow these directions you have a very serviceable door mat that will not easily kick up.

MRS. R. W. WILLIAMS.

CHEAP DRESS-GOODS.

Mrs R. W. W. writes: I think it is mistaken economy to buy cotton and wool dresses. The making, lining, buttons, silk and thread cost just as much as they would for an all-wool dress, and after they are worn a couple of times, their first freshness gone, they are faded and shabby, while by adding a few dollars to the first outlay and buying a good quality of all-wool goods, you have a dress which will look well as long as the fashion lasts, and can then be cleaned and remade. The summer silks are very pretty but are not as serviceable as an all wool dress of a good quality.

A BATCH OF PUDDINGS.

BOILED FRUIT PUDDING.

MIX half a pound of suet chopped fine, with one pound and a quarter of flour, and a teaspoonful of salt; make it into a paste with milk that can be rolled out, spread on it any kind of sweetmeat, roll it up, tie or sew up loosely in a cloth, put in boiling water and boil for an hour and a half.

INDIAN PUDDING WITHOUT EGGS.

BOIL a quart of milk, and stir in a scant pint of Indian meal mixed smooth with cold milk, boil for 20 minutes, add two tablespoonfuls of butter, one each of ginger and cinnamon, and a tablespoonful of salt. Stir in a cup of molasses and bake for an hour and a half. This may be varied by the addition of a cupful of raisins and currants.

OUNCE PUDDING.

NINE tart apples peeled and chopped, one-and-a-half pints of milk, 10 ounces of bread crumbs, and ten of raisins and currants mixed, six beaten eggs, half a grated nutmeg, the grated peel of a lemon, a quarter of a pound of sugar, and a little salt, steam in a mold for five hours. This is a large pudding.

CRACKER PUDDING.

ROLL fine six soda crackers, and pour over them a quart of boiling milk, add six eggs beaten separately, a teacupful of sugar, a pound of currants and raisins mixed, a little salt, and a scant cup of sifted flour. Boil in a mold for two-and-a-half hours.

Santa Clara, Cal. MRS. M. C. HAYES.

PIE MADE OF RHUBARB.

This pie tastes more like green apple than rhubarb. One cup of bread crumbs chopped fine, two cups of chopped pie plant, two-and-a-half cups of water, one cup of sugar, a little salt, two tablespoonfuls of melted butter, flavor with lemon or nutmeg. Bake in deep plates with two crusts. This will make three pies.

S. E. H.

TO MAKE A STOVE SHINE.

A good housekeeper in Bergen Co., N. J., says that she adds a teaspoonful of turpentine to the water she mixes her stove blacking with. She lets the stove become almost cold before blacking.

BREAKFAST MUFFINS.

Three thoroughly beaten eggs, one cup of sifted flour, two teaspoonfuls of baking powder, a scant cup of sweet milk—a little more than two-thirds—a half teaspoonful of salt. Sift the baking powder and flour together, add the milk to the beaten egg and pour over the flour. Beat and pour at once into hot buttered gem pans. The oven must be hot enough to cook them in 15 minutes. MRS. C.

Catarrh

Is frequently an indication of a Scrofulous taint in the system. Ayer's Sarsaparilla purifies the blood, and thus restores health to the affected membranes. It also stops the nauseous catarrhal discharges, and prevents the infection from reaching the lungs and stomach. Catarrh should be treated as a blood disease.

I suffered for years from chronic Catarrh. My appetite was very poor, and I felt miserably. None of the remedies I took afforded me any relief until I commenced using Ayer's Sarsaparilla, of which I have now taken five bottles. The catarrh has disappeared, and I am growing strong and stout; my appetite has returned, and my health is fully restored.—Susan L. W. Cook, 909 Albany st., Boston Highlands, Mass.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

ALLEGER ORGANS you can get a strictly first class organ from $50 to $75, stool and book. Warranted 5 years. It will pay to send for circular before you buy. Address the manufacturer. H. W. ALLEGER, Washington, New Jersey.

HIRES' IMPROVED ROOT BEER. Packages, 25 cts. Makes 5 gallons of a delicious, sparkling and wholesome beverage. Sold by all druggists, or sent by mail on receipt of 25 cents. C. E. HIRES, 48 N. Delaware Ave., Philadelphia, Pa.

ELEGANT SHAPE, HEALTH and COMFORT

Perfectly Combined in

MADAME FOY'S Skirt Supporting CORSET.

It is one of the most popular and satisfactory in the market. For sale by all leading dealers. Price by mail $1.30.

News of the Week.

HOME NEWS.

SATURDAY, June 5, 1886.

THE Knights of Labor and Trade Unions Convention at Cleveland, Ohio, is over. No definite agreement was made between the two, the Knights wanting the control of strikes and boycottings; the Trades insisting that each trade should decide upon and manage these for itself. A large number of "trade-unionists" are also Knights, and in case of a conflict these would withdraw. Powderly and the other old officers of the K. of L. remain in power, but six new ones were elected, and these with some others already in control will be likely to form a majority with a more violent policy than that of Powderly, who is opposed to strikes and boycotting. By his efforts it was agreed that hereafter the Executive Board must approve all strikes, and, except in certain grievous cases where immediate action is necessary, a strike or boycott will not be allowed without their approval. Twelve propositions are embodied in a demand on Congress made by the Knights of Labor. The first seven relate to the public lands—keeping them for actual settlers, fully taxing those owned by corporations, forfeiting un-earned grants, barring alien ownership, etc.; the eighth asks the abolition of all laws requiring a property qualification for voters; the ninth favors an income tax; the 10th protests against the cutting down of the appropriation for the Labor Bureau; the 11th asks for the passage of the bills approved by the Congressional Labor Committee; the 12th asks for a passage of a law prohibiting the employment of minors for more than eight hours per day. Congressmen who pay no attention to this demand will be put "on the list." They also want Congress to regulate interest on money by opening loan offices where money can be got at three per cent on prime security..... .....It is not unlikely that the newspapers in favor of Capital against Labor, are exaggerating the dissensions, faults and shortcomings of the convention..... Labor troubles quieting down. Eight hour movement collapsed. Third Avenue strike here a complete failure. Employers everywhere organizing for a war of resistance against future demands: Example, 47 hosiery manufacturers of Philadelphia, Pa., employing over 12,000 hands, have organized for mutual protection on account of the recent demands of employés. Nearly all the prominent manfacturers were represented at the meeting. ...Last Friday and Saturday (May 29 and 30) the tracks on the Southern railroads (15,000 miles), were changed from five-foot to the standard gauge for the rest of the country. The trucks of engines and cars were also changed to suit the new gauge; yet all was done with such lightning rapidity along the various lines, that only an occasional through train was delayed a little. Henceforth one sort of engine or car can travel on 90 per cent. of the roads of the country....Although a constitutional amendment has prohibited the liquor traffic in Maine since 1884, the Collector now reports the traffic steadily on the increase!...The Senate has passed the bill "to prevent the acquisition of real property (land) by aliens"—in the Territories, of course .....Of late the "Salvation Army" has caused a great deal of trouble by its public vagaries in large and small towns nearly all over the country—its chief illegal fault in most cases being its absolute refusal to obey the orders of the municipal authorities forbidding its noisy street parades. At Beloit, Wis., it caused a serious riot the other day by refusing to obey the Mayor's orders.... .. The bill to tax railroad lands, which now escape in most cases in the Far West, because the railroads won't pay the cost of surveys, is being vigorously pressed by the Western Senators in the Senate; also a bill compelling the roads to have their grants surveyed at once, and in case of neglect, refunding the cost of surveying to outsiders who have done the work.....Neither Washington Montana nor Dakota Territories will be admitted into the sisterhood of States this year. The first and last are Republican, and the Democratic House know their votes would outweigh those of Democratic Montana..... About 250 representatives of stove-makers, assembled. Wednesday, at Cleveland, Ohio, and decided to raise the price of stoves throughout the whole country..... Gov. West, appointed to succeed Murray in Utah, went the other day to the penitentiary where 49 convicted polygamists are serving their sentences, and after some "goody-goody" talk, promised to secure their pardon if they would renounce polygamy. They have just answered they value polygamy above all other relations human or divine, and will all redouble the practice as soon as they get a chance. Document circulating like wild-fire through Mormondom, and encouraging the "Saints" everywhere. West has "slopped over" as Murray would never have done.....The House, after having shamefully pigeonholed Edmund's Senate anti-polygamy bill, now propose to bring in one still more severe—mere "bunkum" to bamboozle indignant constituents. All know it is now too late to pass such a measure—Mormon lobby triumphant!..... Maine Democrats have nominated Clark S. Edwards for Governor.....The lately established New York State Board of Arbitration, organized, Thursday, with William Purcell, of Rochester, as President. Quite a number of States have lately established such Boards, which must give advice without power to enforce it.....Ex-Treasurer Martin O. Van Fleet, of Huron County, Ohio, charged with having misappropriated $65,000 of the County funds, has been extradited by the Dominion authorities. They should do the same with the numerous other American swindlers skulking in hotels and boarding-houses, but, then, the rascals squander their plunder freely!.....The work of Congress to Thursday is thus briefly epitomised, from Speaker Carlisle's examination of the books of the House: Introduced in the House, 9,125 bills and 178 resolutions. Of these, the House has passed 191 public and 741 private bills, and the Senate has concurred in 72 public and 384 private bills. There have been 2,580 bills and 68 joint resolutions introduced in the Senate, of which that body has passed 157 public and 323 private bills; and the House has concurred in 36 public and 87 private bills. Thus the total result of the labors of Congress to Thursday last was 11,951 bills and resolutions introduced, and 108 public and 471 private bills acted upon by both Houses. Nearly all the "private bills" were pension bills giving pensions or increasing the same in cases not provided for by the existing laws.... No prospect of passing the general bankruptcy bill through Congress at this session, as the West and South are strongly opposed to a measure supposed to be contrived in the interest of Eastern dealers and money lenders. Many others object to the bill as increasing the security for debts, and therefore likely to enlarge their amount. The bill would be splendid for lawyers, as it would force into involuntary bankruptcy all 30 days behind in their payments. What a tremendous crop of lawsuits from this clause alone!!!.....Herr Most, a lately landed, loud-mouthed, virulent, cowardly German Anarchist, who through his catch-penny paper in this city, tried to incite riot, pillage and assassination, has been just convicted of having done so, and sentenced to one year's imprisonment and a fine of $500—the highest penalty. One of his fiery, blatant confederates got nine months, and $250; another nine months without a fine.....Now indictments against the Chicago rioters; and indictments also found against the Milwaukee Anarchists. This foreign scum is lashed all round.....A Congressional report intimates the practical failure of Ead's jetties at the mouth of the Mississippi. He really did deepen the channel, but the accumulating mud brought down by the river causes constant bars....Decoration Day a glorious success here and everywhere else. Here Grant's tomb was magnificently decorated, flowers coming from all parts of the country, even from California. The Emperor of China ordered his Minister to come from Washington to decorate the tomb. Logan spoke ....John H. Deane, of this city, for years counsel for the American Baptist Missionary Union, is "short" $150,000 in its funds entrusted to his honesty. .....The Presbyterian General Assembly which adjourned Monday at Minneapolis, objects to advertising in Sunday papers; and allows music in the churches.....Subscriptions for the families of the Chicago murdered policemen amount to over $70,000..... The New York Supreme Court has affirmed the conviction of Alderman Jaehne..... Canada is to investigate the Northwestern Indian trouble.....The Dominion Parliament at Ottawa was prorogued Wednesday. Governor-General Lansdowne congratulated both Houses for granting proper representation in the Commons to the Northwest Territories; on the completion of the Canadian Pacific R. R.; on the repayment by it of the advances it had received from the public treasury, and on the establishment of a public printing office like that at Washington..... The Canadian export duty on pine logs has been reduced from $3 per 1,000 feet to $2. .... Oregon is prospering from new immigration this year as never before, and it is almost exclusively American, as foreigners are generally too poor to travel so far. Portland has added 2,000 to her population. Agriculturally the State is "booming."....Rhode Island prohibitionists are much excited at the election of Brayton as chief constable to enforce the Prohibitory Amendment to the Constitution lately passed. They say he is a very bad man, and his bondsmen had to make up a deficit of $30,000 in his accounts while Postmaster at Providence..... .....Our government has released that Canadian schooner without exacting the $500 fine. Canada has seized another of our fishing vessels. Bait is being clandestinely sold by the 'long-shore Provencials. Our fishermen have lost a good deal by the Dominion embargo on bait and ice, and some won't pay expenses where usually they would have made a good surplus. Negotiations still in progress between Washington and London. Looks as if the British Government will side with Canada. Much complaint at the dilatoriness of Sec. Bayard. "Reprisals" the favorite cry. War talk here and there; war thought nowhere..... .....Denver, Col., greatly excited over the striking of oil in the heart of the city by people who were sinking an artesian well. Oil began to flow at a depth of 1,100 feet. Old oil men from Pennsylvania say that the prospect is good for a big flow.....James G. Blaine made a rattling, Irish-vote-catching speech at the "Gladstone meeting" at Portland, Me., the other night.....The public debt was decreased $8,828,566 last month, against a decrease of $10,065,388 in April. The debt, less $302,164,274 available cash items (including $100,000,000 reserve) and $76,142,611 net cash in the Treasury, is now $1,398,198,282. ....Pasteur's hydrophobia cure is to be tested in this city. Dr. Mott and assistants are "producing" rabies-virus, and two patients are waiting to be inoculated..... .....The Dominion Government has refused to sanction the anti-Chinese legislation passed by the government of the Province of Columbia..... ....We are glad to learn that the enterprising dry goods house of Messrs. James McCreery & Co. are falling into line in the early closing movement. For the month of June they will give one-half of their employés, alternately, the whole of Saturday each week. For the months of July and August they will give one-half of their employés, alternately, the whole of Saturday in each week, besides closing as usual every Saturday at 12 M. during these months. This arrangement, though somewhat novel, is quite satisfactory to all concerned...

FOREIGN NEWS.

SATURDAY, June 5, 1886.

LITTLE foreign news of general interest during the week. In England the Home Rule bill is still bitterly debated in the Commons. A vote on the second reading will be taken at 2 o'clock next Tuesday morning, and how it will go is still extremely doubtful: but it is probable it will be defeated. Gladstone will then dissolve Parliament, a new lot of members will be elected, and the people will thus decide the question. In Ireland the Orangemen are enrolling themselves and drilling; an army of 75,000 men is reported to be ready to take the field to oppose a Parliament in Dublin. Many tenants still refuse to pay rent, and much consequent distress prevails among some of the poorer landlords. A great deal of forced idleness and consequent privation among the laboring classes all over the United Kingdom..... .....In Spain the young King is getting along well. Don Carlos has issued a proclamation that he will never, under any circumstances, resign his right to the Spanish throne..... In Italy cholera has been making little headway of late. The Pope and the King are becoming more friendly. Great distress and poverty among all working classes, especially the agricultural.....In Germany Bismarck is redoubling his efforts to stamp out socialism and agitation of all kinds, while keeping a watchful eye on the movements of Russia against Turkey and British India..... .....In France the bill expelling all the descendants of former sovereigns is pretty certain to pass the Legislature. It will not be left to the option of the government to expel them; nor will expulsion be confined to the prominent members—all are to be exiled, not by the Government, but by the Legislature. The "princes" are preparing for exile. A good deal of labor trouble, especially among metal workers and miners. Strikers becoming riotous and threatening to use dynamite..... Russia is massing troops in the south, and thereby disturbing Turkey and Austria, as they fear the Czar is meditating a march on Constantinople.....Greece and Turkey have made peace without the intervention of the "Powers," and the Turks have surrendered 1,200 prisoners made in those frontier scrimmages, so it seems Greece got much the worst of the fighting.....

AGRICULTURAL NEWS.

SATURDAY, June 5, 1886.

THE sudden appearance of myriads of grasshoppers has created a panic among farmers in Williamson, Bell and Falls Counties, Northeastern Texas. Farmers hurridly assembling to devise means for averting the destruction of their crops .....The English Privy Council, last Wednesday, made Dundee, Scotland, an open port to foreign cattle. Glasgow, Hull, Liverpool, London, Cardiff, Bristol, Plymouth, Portsmouth and London have hitherto been the only ports open to this trade, and American trade has almost exclusively been with Glasgow, Liverpool and London, the other ports dealing almost entirely in Continental cattle. The opening of Dundee will, it is thought, improve the trade in American cattle.....The sugar crop of Egypt is very small this year, and some of the public sales have been stopped because prices are so very low. Bad news this for English, French and German bondholders. Egypt is held and farmed by the English with the single object of wresting from the wretched, starving fellaheen taxes enough to pay interest on these bonds, which bear preposterous interest, and were given for money wastefully and wickedly squandered by the Khedive Ishmael. The condition of the Egyptian fellaheen, under British rule, is worse even than that of the Hindoo ryots or the Irish peasantry..... Tremendous drought all through Texas, but especially in the Western section, including 48 counties and embracing a region larger than Illinois. Reports from the interior bring horrible accounts of suffering from drought. The loss of live stock will rise high among the millions, perishing from thirst and starvation by tens of thousands on the dried-up prairies and along the dusty, parched water-courses. All growing crops ruined or cut down fully one-half. Even in Galveston, where cistern water alone is used by a population of 40,000, fresh water is peddled in the streets at 50 cents a barrel. Hotels, etc., are using salt water for washing purposes. Fresh water has to be brought in tanks from Houston, 45 miles away. The longest and severest drought known in the history of Texas.....Just as we go to press the telegraph tells us a widespread rain has partly relieved the distress in a great part of the State..... .....

Epidemic at Ohemnitz, Germany, from eating raw beef—not pork—123 victims reported; disease still spreading.....The receipts of the Chicago citrus fair cover expenses so that California oranges, lemons, etc., have had a good advertisement *gratis*.....The Clydesdale Horse Society of Great Britain and Ireland, will present valuable medals for competition at the Clydesdale show, to open at Chicago, September 6, 1886. Competing animals must be entered in the British or American Clyde stud-book.....Jack rabbits are so unprecedentedly multitudinous as to be a grievous plague to the stockmen of Nevada, Utah and parts of Idaho. They swarm in the valleys eating more grass than all the herds and flocks. The last Legislature put a bounty on the scalps of coyotes, the next will be urged to take it off, as the increase of the pests is attributed mainly to the slaughter of the "wolves of the prairies" which used to feed upon them.. .....Over 12,000 acres belonging to Jay Cooke & Co., in Minnesota and Wisconsin, were auctioned off in Chicago the other day. Prices generally low .....At several of the grain warehouses at Chicago, 1884 wheat is said to have been mixed with that of 1885, to prevent shippers from drawing out the "old" wheat which is preferred to the "new."....Frosts and hail storms have been very destructive to the potato crop in some parts of Ireland..... Not only are our foreign cattle syndicates and barons turning their attention to the Canadian Northwest for grazing lands at a nominal rental, but many of our native "kings" are doing so too. Several are already seeking to rent large areas there, for grazing. Will the Canadian Government be as "liberal" as Uncle Sam has been? ...."Is ranching doomed?" is becoming a question in the West.

Especially Thoughtful People.

IN common with other thoughtful people, clergymen look with interest upon any method of relieving suffering. But they are very cautious about giving their names as witnesses to the value of any new candidate for favor in the healing art. They see many people and hear discussions of the merits and demerits of everything asking attention. The testing thus afforded secures them from making the mistake of hasty judgments, and gives to their utterances a value which those of few others can have. When so many therefore cheerfully make statements like the following, the seeker after health has reason to take courage:

Rev. Edward J. Fisher, Pastor of a Presbyterian Church, Bristol, Morgan County, Ohio, writes:—"A Treatment cured me of a severe attack of pneumonia, and I used only two-thirds. The rest cured a neighbor of *pneumonia* in its last stages."

Rev. Anthony Atwood, a widely known superannuated Methodist Clergyman, of the Philadelphia Conference, at the age of eighty-four, writes:—"I recommend Compound Oxygen to all who suffer from throat diseases."

Rev. J. H. Chandler, Missionary thirty-eight years to Siam, representing the Baptist Church of America, now returned, and living at Camden, New Jersey, writes:—"To all diseased, worn-down, disheartened fellow-sufferers, of every land and tongue, I beg to say, there is

hope for you in this remedy. Try it; be healed and live."

Rev. A. W. Moore, Editor of the *Centenary*, Darlington, S. C., says:—"I feel more life—more vigor—than I have had for years. I believe Compound Oxygen a blessed providential discovery."

Rev. Cyrus Hamlin, D. D. LL. D., President of Middlebury College, Vermont, writes:—"I derived so much benefit from your Compound Oxygen Treatment, last year, that I will ask you to send me the same supply for home treatment, for which I inclose the price. By my advice others have tried it, and never without benefit."

Rev. A. A. Johnson, A. M., formerly Financial agent, and now President of Wesleyan College, Fort Worth, Texas, wrote February 21, 1885:

"DRS. STARKEY & PALEN:—From 1878 to June, 1883, I was troubled more or less with catarrh. During those years I tried several remedies, but from them I received no permanent relief. In the Winter and Spring of 1883, I grew a great deal worse, and suffered greatly with sore throat, hoarseness, and catarrhal fever. At times I could not speak publicly, because of hoarseness and coughing. Alarmed at my condition, I sought a remedy, and was led to try the Compound Oxygen cure. It worked liked magic. Within two weeks my hoarseness and sore throat were gone, and my general health began to improve at once. At the end of three months, when I had finished the first Treatment, the catarrh was gone. I regard the Compound Oxygen Treatment as *a wonderful discovery* of science and a blessing to suffering humanity." Nov. 2, 1885, Mr. Johnson writes:—"You are at liberty to use anything I have written you in favor of Compound Oxygen. I regard it as a great remedy."

Rev. I. S. Cole of the Protestant Episcopal Church, Manitowning, Algoma, Ontario, Canada., writes:—"I deem it a high privilege to be able to assist in any way in making known so wonderful a discovery as your Compound Oxygen. I have found it of great benefit in my own family, and know of good results in the families of acquaintances."

Curiosity as to Compound Oxygen may be fully gratified by any one who will take the the trouble to write a postal card or letter of request to Drs. STARKEY & PALEN, at 1529 Arch St., Philadelphia. All their literature, or any part of it, will be sent, postpaid, freely, to any address on application.—*Adv.*

Crops & Markets.

SATURDAY, June 5, 1886.

Foreign cables have been exercising a steadily depressing influence on the wheat market during the week. Last Monday the London Mark Lane Express cabled to New York that English grain crops and trade had been checked by cold rains. Wheat, it was added, was more difficult to sell, and "rates for American (flour) were in buyers' favor." Wheat futures were easier. The present week opened with foreign wheats at London one to one and one-half cents lower per bushel, and with the demand almost nil. In France heavy receipts of wheat from Russia and India have lowered the market. Needed rains have greatly improved the wheat prospects in Southern Russia. Prussian and Austrian grain markets have been somewhat firmer. Recent mail advices mention a need of rain in central Europe.

At home the extreme depression in the wheat market for some time back was decidedly checked on Wednesday. The decline was due to free receipts at all points; the proximity of the new crop, backed by very favorable reports as to yield; the light export movement; the unwillingness of England to buy at our quotations, although her stocks were greatly depleted, and, finally, to the heavy bear operations at Chicago. The advance was due to a falling off of over 3,000,000 bus. in the visible supply; reports of considerable injury to winter wheat north of the Ohio from bugs, together with reports of cold rains, etc., and freer exports. The reaction caused an advance of from 1c. to 3½c. per bushel, Chicago leading, but New York following close behind. It is doubtful, of course, whether the upward movement will continue; but it ought, in view of the reduced reserves at home and abroad, a moderate crop in India, a short one in Australia, and doubtful outlook in Russia and the United Kingdom.

THE McCORMICK harvester reports give the following as the latest percentages of crop condition on wheat: Wisconsin 99, Nebraska and Dakota 98, Kentucky, Minnesota, and Iowa 97, Missouri 91, Ohio and Indiana 88, Illinois 86, Michigan 85, Kansas 50. Chiefly owing to unfavorable weather and the ravages of insects, the average condition of the winter-wheat crop was reduced about six per cent. during May. Condition of spring wheat crop higher. Outlook favorable to another large crop of corn, oats and grass.

Statistics compiled by the Washington Bureau of Agriculture, as given by the Associated Press, show that the world's product of wheat in 1885 was 2,110,000,000 bushels, the requirements of consumption 2,165,000,000 bushels, presenting a deficiency of 55,000,000 bushels drawn from the previous year's surplus of 125,000,000 bushels. They find the product of Europe a medium, those of India and Australia large, and a heavy reduction in the United States. For the supply of the coming year the crops of Australia, India, and South America already harvested are probably about 32,000,000 bushels less than those of last year, while those of the United States promise fully 100,000,000 bushels more than the harvest of 1885. The wheat in the United States on May 1 last was 104,000,000 bushels, against 152,000,000 bushels in 1885.

The visible supply of Indian corn increased 100,000 bushels during the week, and that of oats 400,000 bushels, hence, instead of sympathizing with wheat, both were lower.

Very little interest anywhere in hog products during the week. Chicago stocks of hams, short-ribs and shoulders are reported to be 20,000,000 pounds less than on May 1. Receipts of hogs at Western packing centers continue full, and there does not appear to be any likelihood of an advance at any early date.

At Philadelphia there is a good jobbing trade in hog products, and prices are firm. Butter is steadier under a more active demand. Cheese is one-half cent lower. Eggs are a shade lower and plentiful. Potatoes have advaneed under light receipts. Excepting bacon, provisions at St. Louis are dull, but without especial change of values. Cattle are in lighter offering than usual, and there is no reliable demand for any but the best grades. Hogs have been in good supply and very active at strong values, but the market is easier now.

There is a tendency to hold butter for better figures; but if the receipts continue as large as now, these are hardly likely to be offered.

	June 4, '86.	*June 4, '85.*
Creamery, new choice to fancy	16@18c.	16@17c.
State, new dairy fancy.....	15@16	15@16

Foreign advices for cheese are not encouraging. Receipts so far considerable smaller than last year; prices therefore better.

	June 4, '86.	*June 5, '85.*
New.....	7⅛@7⅜	6@6¼

The wool market is looking cheerfully up: holders have seldom got better prices; but they are less anxious to sell. The better outlook is due principally to brighter advices from London and Antwerp. Heavy purchases for manufacturers and dealers in Texas, especially at San Antonio. In Ohio and Michigan, prices asked are somewhat higher than at the same time last year. In Boston quotations show an upward tendency, and manufacturers appear ready to lay in stocks. Ohio and Pennsylvania X wools should now be rated at 30 to 31 cents, against 29 to 31 cents, last week, and Texas spring of 12 months' growth at 20 to 23 cents, instead of 19 to 23 cents. The current quotations for leading sorts are as follows.

Ohio and Pennsylvania X.....	30@31c.
Ohio and Pennsylvania XX.....	31@32c.
Ohio and Pennsylvania XX and above.....	32@33c
Michigan X.....	27@28c.
Fine Ohio delaine.....	30@32c.
No. 1 combing.....	31@35c.
Texas spring, 12 mos.....	20@23c.
Super A.....	31@31c.

Philadelphia market steady; holders refuse to make concessions; manufacturers disposed to fill up at bottom quotations. Interior markets also firmer. Receipts are light, as dealers are unwilling to pay the figures asked by growers.

MARKETS BY TELEGRAPH.

SATURDAY, June 5, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 2⅝c. higher. No. 2 Spring, 3½c. higher. Corn, ¾c. lower. Oats, 1⅜c. lower. Pork, 17½c. higher. Cattle, some grades a trifle higher; others a trifle lower; prices average about the same Hogs, 5c. lower. Sheep, a shade lower.

WHEAT, active; Sales ranged: June, 76½@78c; July, 77⅝@79½c; August, 78⅝@79⅞c; No. 2 Spring, 77@77⅝c; No. 3 Chicago Spring, 66@71c. CORN.—Firm. Cash, 34½@35¼c; June, at 34⅜@35¼c; July, 35⅝@36¼c; August, 36¾@37c. OATS.—Firm. Sales ranged: Cash, 26⅜@26½c; June, 26⅝@26¾c; July, 26⅝@27⅛c. RYE.—No. 2, 57c. BARLEY.—No 2, at 55c. MESS PORK. Cash, at $8 50@8 55; June at $8 82½@8 85; July, $8 0@8 72½. LARD.—Cash, $5 87½@5 95; June, $5 9.@5 97½; July, $5 97½@6 05. BULKMEATS.—Shoulders, $4 30@4 35; Short rib sides, at $5 20@5 25; Short Clear sides, at $5 65@5 70. CATTLE—Market slow; 5 to 10c. lower than Yesterday. Shipping steers, at $4 30@5 55. stockers and feeders, $2 90@4 00; cows, bulls and mixed at $1 50@3 75; bulk, $2 80@3 00; thorough Texas cattle, $2 75@4 85. HOGS.—Rough and mixed, $3 65@4 05; packing and shipping at $3 90@4 10; light, $3 70@4 0.. SHEEP.—Market steady; Natives, $2 00@4 10, Texans, at $2 15@3 00.

ST. LOUIS.—Compared with cash prices a week ago, wheat is steady. Corn, 1⅜c. lower. Oats, 4¼c. lower. Butter, creamery, steady,; dairy, 1c. to 2c. higher. Flaxseed, steady. Pork, 25c. lower. Cattle, shipping steers, from 35c. to 40c. lower; other grades teady. Hogs, 5c. lower. Sheep, unchanged.

WHEAT.—Active; No. 2 Red, Cash, 76¼@77½c; June at 77½c, July at 77¼@78c; August, 79½c. CORN.—Dull; No. 2 mixed Cash, 30¾@32½c; June, 30@c; July, 32½c. OATS.—Dull, No. 2 mixed, Cash, at 26@26½c; June, at 27c; July, at 26c. RYE.—Quiet at 59c. BARLEY.—There is no market. BUTTER.—Quiet; Creamery, 14@15c; dairy, 11@13c. EGGS—Quiet at 8c. FLAXSEED at $1 00@1 01. HAY.—Timothy, $13 00; Prairie, $; 00. BRAN 63c. at mill. CORN MEAL.—Steady at $2 00. PORK, at $8 75. BULK MEATS.—Long clear at $5 80; Short Rib, $5 40; Short Clear, $5 55. LARD.—Steady at $5 67½@5 75. CATTLE.—Market firm; Fair to Choice Native Shipping Steers, at $4 80@5 35; Native Butcher Steers, $3 50@4 75; Cows and Heifers, at $2 25@3 80; Stockers and Feeders, $3 25@3 60. HOGS.—Light, at $3 80@4 00; Packing, at $3 85@4 05; Heavy, $4 10@4 15. SHEEP.—Market steady at $2 50@4 50.

BOSTON.—CORN.—Steamer yellow, at 50@50½c, and steamer mixed at 49c., and no grade at 35@47c. per bushel, as quality. OATS.—No. 2 white, 43@43½c; No. 3 white, at 42@42½c, and fancy white and barley are held at 44@46c. per bushel as to quality. Rye is selling at 65c. per bushel. Sales of Bran at $14@15 for Spring and $17 00 for Winter; fine feed and middlings at $14 00@15 00 and cotton seed meal at $23 00 on spot and $22 25 per ton to arrive. HAY AND STRAW.—Hay is in fair demand at $19@20 per ton for choice and fancy; fair to good, at $17 00@18 00; fine, at $16 00@17 00, and $13 00@15 00 for poor and damaged; Western choice, $17 00@18 00; do fair to good $15@16. An Editor's Friend.

NEW CASTLE, Pa., March 27th, 1885.—I had a painful affection of the liver, and let it alone, until it got a firm hold of me. Took seven or eight bottles of Warner's safe cure, and am perfectly well, without pain.—F. J. MELANY, Editor *Clarion*.

For the Young.

DECORATION Day has come and gone. No doubt most of you helped to celebrate it. You will wonder, perhaps, why I talk about it after the celebration is all over. There were so many to talk and write about the day before it came that I have waited till now so that what I have to say can be remembered. Every one of our great holidays serves a good purpose. They take our thoughts away from the present, away from ourselves, and show us that we do not live for ourselves alone, but that this is a great big country, stretching thousands of miles North and South, East and and West. Every man and woman and every boy and girl ought to feel an interest in this country. It has cost too much to preserve the Union and to make this country what it is, for us to say that there are plenty of others to look out for good government and all that sort of thing. It is just such a spirit that makes war and bad government possible. Decoration Day is, to my mind, one of the most useful of all holidays. We always like to talk about brave men and brave deeds—it does us good to discuss them. The world has never seen braver men than those whose graves are covered with flowers on Decoration Day. I do not think the world can produce braver or nobler women than those who sent their husbands and sons and brothers to the war, and did a man's work at home that the battles might be fought. These things are sure to come into our minds on Decoration Day and they ought to do us good. We do not need to go back into the centuries, or to go to other countries to find examples of bravery; we have them here. Each one of my boys and girls desires to be good and true and brave. I never yet heard of a boy or girl who made a bad man or woman from choice. I hope our boys will never be called upon to fight, and I hope our girls will never be obliged to act as home soldiers, yet I know that there are thousands of little battles that you will have to fight before you can be the men and women I want you to be. There are a dozen giants like selfishness, carelessness and laziness that will be sure to want to fight. You must do the fighting alone for nobody can do it for you. You will need the same silent and patient courage that has called out the great heaps of flowers in the soldiers' graveyards. For this reason I say that Decoration Day has its uses. It should always be celebrated, and its memories should be cherished.

Look out for the slugs on the roses now. They will do plenty of damage unless you take them in time. Look for them on the under side of the leaves. The flies saw into the leaves and lay their eggs. When the slugs hatch out they feed upon the leaves and soon make them look as if they had been burned. A solution of whale oil soap in water will make them leave, but a good dusting with pyrethrum will make sure work.

Now is the time to get "into print" easily. We have more space now, and perhaps we can crowd that advertising column off the page. Let us try it. Who can tell us about catching moles, or keeping rabbits, or planting nuts, or in fact about anything that is a little new? You will get an idea from the above of a letter that will surely be printed.

Lists have been received this week from Abbie Ward; Freddie J. Champion; Stella Woodard; Clifford D. Greene; Sidney G. Anderson; Amy E. Taylor; Bessie Cole; Jessie M. Andrews; Dora Brasie; Fred Balsey; Freeman E. McNall; Nellie M. Sankey; Johnnie F. Holm; Emily Cockeran; Mary E. Nicholson; Emma Mohr; Harry Daxe; Mary Garmory; Lottie E. Stevenson; Julia E. Newman; Dennie E. Boyd; J. G. Campbell; Herbert Damrell; Harry M. Hart; John C. Hick; John Z. Reed; James H. Lewis; S. C. Stockton; George C. Brower; Asa Wersom; Walter Puntenny; Jos. Greethurst; Rubie Van Demark; Willie Marvin; Hoyt G. Muffitt; Thomas Knowles; Lillie Moore; Lewis W. Peterson; C. C. McClure; Eva and Fred. Bomber; Walter Fisher; Grace Dille; Walter H. Beall; Hubert E. Turner; Mark E. Hoose; Ethel M. Bennett; Robert M. Colt; Mary C. Green; Ada R. Allen; E. M. Burge; Frank C. Evarts; Lee Webster; Truman Gerould; Elmer R. Young; James M. Stevens; Lillian Newman; James A. Leland; John Ohline; Wirt M. Bishop; Sarah J. Gordon; Bertie Season; Joseph E. Crocker; Bessie D. Sandess; Orris French; and Agnes S. French. I have not had time to count all the lists yet but I am sure that there are many thousands of words in all. The papers, all pasted together would make a very long roll. Some of you did not understand it as I did. I find some words with more than one w and more than one h. The idea was to use only the letters that can be found in the three words given. I shall have to cut out all these "bogus" words.

A GOOD TRAP.

DEAR UNCLE MARK: Perhaps some of the boys in the RURAL family would like to make a box trap that will catch a rat, squirrel or rabbit, and be sure "every time." The enclosed sketch is a box trap open at either end and has a simple tripping arrangement connected with the bait. The trap I made was of sound, weather-stained boards (to avoid suspicion—light boards would not do), 26 inches long, 6 inches deep and 10 inches wide, inside measure. On the side opposite the bait, nail a standard outside, to extend 6 inches above the top of box. Nail a piece 2 inches wide and 12 inches long across top of box at center for post to rest on and to hinge lids to. On top of posts nail a piece about 9 inches long. Bore a hole

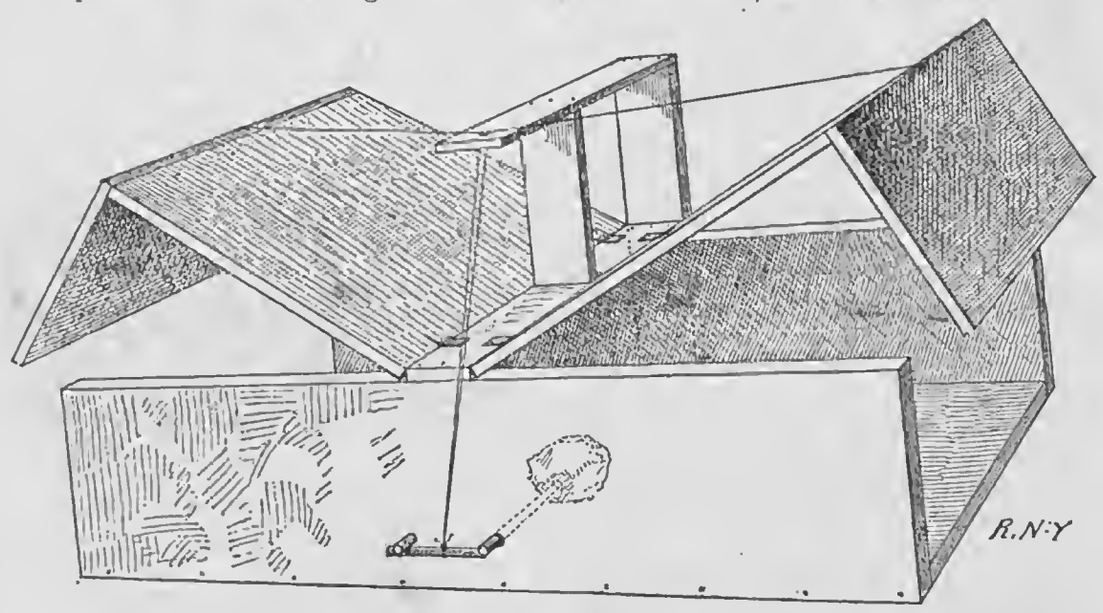

Fig. 254.

through the end of this piece for strings to go through, hinge the doors or lids to the center cross-piece. For bait bore two small holes, put a peg in tight at one and let it stick outside one-half inch, and in the other put a loose peg with bait tied on inside. Make the two strings even in length and tie them to the short loose stick. Now set the trap "ticklish," so a slight nibble will trip it. This is very simple, and can be made with saw, hammer and nails and square. As rats and squirrels will gnaw, take some old rusty tin and protect places where light shines in.

M. H. C. GARDNER.

Johnsons, N. Y.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: As my last letter was not printed, I will try again. Papa received the RURAL seeds and gave me the Garden Treasures, and I have planted the sweet peas. I go to school and have the same teacher I had last term. Papa has a span of Norman colts two years old and their names are Tom and Dan. He has driven them and carried me to school. This Spring he tapped about 250 trees and made quite a lot of sugar, and I had all the warm sugar I wanted to eat, and wish you could have been here to eat some. Will Uncle Mark or some of the RURAL Cousins please tell me how to grow pansies? I have tried two or three times, but without success.

Sandy Creek, N. Y. STELLA WOODARD.

[Who has had the best success with pansies? I am glad you have the same teacher—U. M.]

DEAR UNCLE MARK: We are having fine weather for growing things, though we had an uncommonly cold winter. We have some corn a foot and a half high. In March last, we put out 1,000 plants of Crescent strawberries, and 500 of some other kinds, but the Crescent is a great deal the best. We planted the Alaska Peas, and they were getting along finely when the rabbits found them, and now we won't get back as much as we planted. We will have wheat to cut in a few weeks. We have potatoes and beans in bloom; tomatoes also. If we had not taken your paper we would have lost a horse and Jersey cow that we paid $65 for, so your paper has helped us. Last year we had two great big watermelons; one weighed 49 pounds and the other 20.

Your loving nephew,

Chickamauga, Tenn. JOHNNIE F. HOLM.

HAZE.

"I RECK'N I done quit fo awhile boss."

As the engine made this remark, he stopped turning the press and took up the bundle of rags which served him for a handkerchief. He polished his face lustily as the press went on until I had "fed in" the next paper. Then, with one hand the engine stopped the wheel and repeated his remark.

Now don't drop me entirely because I speak of an engine's talking. Give me a chance to explain. Our engine was a tall, strong colored man. We called him our engine, because he surely did an engine's work, and because he was the only one we had. We liked to speak of our "power press," and never cared if the public saw fit to make us more powerful than we really were.

Our engine was certainly stronger than any of his steam brothers of equal size. His muscles were like steel rods and his lungs were as strong as an iron boiler. He never puffed at all over his work, while a real engine would make a dreadful outcry when pushed a little.

The engine looked anxiously at me as he mopped his face. I was feeling rather good natured—no, I will tell the truth and say that I was lazy—so that I nodded to him. He never waited for a second word, but ran out at the door with all speed.

A short time after this I chanced to look out at the window and saw the engine in what seemed to me a curious position. There was a fence—in fact, several of them—between us, so that I could only see the upper part of his body. That was enough, however. He stood with his hat off and his head bent forward. His wife stood close at hand in very much the same position, while one or two little woolly heads just reached to the top of the fence. It seemed like a curious position in which to find the engine and his family. I had seen him in many ridiculous positions, however, so that it did not seem so far out of the way after all. A white man would have taken such a position at the grave of a very dear friend, but no one thought of the engine as a mourner. I contented myself with calling him back, thinking his vacation had been extended long enough.

In a short time he came rushing back to the office. He caught hold of the wheel and fairly made the press fly. After a "run" that made a great hole in the papers, he stopped to fill his pipe. As he rubbed the tobacco up in his great hands, it seemed to me that there was something wrong with him. He laughed and grinned just the same as ever, and fairly tied himself into a knot when I remarked that his pipe was strong enough to turn the press. Back of all this mask of gaiety, however, there was something that told me he was greatly troubled.

I doubt if I could have found out the reason of this trouble, however, if a friend of his own color had not dropped in. This gentleman had evidently called during the engine's absence. From their conversation I got something of an idea of the cause of the engine's seriousness. Let their dialogue tell the story.

"Whar you ben at," said the new comer, as he took off his hat and turned it into a fan. "I cum round yer awhile ago but done see nuffin ob you; reck'nd youse done quit."

"The engine rubbed away at his tobacco as he answered—"I'se ben to de berryin—dats whar I's ben at. I hates powerful ter quit, but pears like I orter go."

"Whose berryin' at wuz? Didn't know dat nobody wuz dead." The visitor spoke sadly, just as if he was sorry to miss such an important event as a berryin.

The engine began to act a little foolish again. He laughed and hung his head down as he answered, "It want one of dese sho' nuff berryin's—jest my dog; but 'pears ter me," he said, as if to explain something of his conduct, "dats deres a heap of men dat done deserb a berryin more dan dat dog done."

The visitor evidently began to get interested. He stopped waving his hat and thrust his great lips out in surprise as he asked: "How dat dog ob youse come ter die like dat? I reck'ned dat wuz de livest dog dey wuz in de hull place. Whar he die at?"

(To be continued.)

Don't kill the toads, boys. They do too much good. Let us spend all we desire to kill on the potato bugs.

AN OPIUM EATER'S STORY.

CRAWLING OVER RED HOT BARS OF IRON IN FEARFUL FRENZY—A SCIENTIFIC INVESTIGATION AND ITS RESULTS.

Cincinnati Times-Star.

"Opium or death!"

This brief sentence was fairly hissed into the ear of a prominent druggist on Vine street by a person who, a few years ago well off, is to-day a hopeless wreck!

One can scarcely realize the sufferings of an opium victim. De Quincy has vividly portrayed it. But who can fitly describe the joy of the rescued victim?

H. C. Wilson, of Loveland, O., formerly with March, Harwood & Co., manufacturing chemists of St. Louis, and of the well-known firm of H. C. Wilson & Co., chemists, formerly of this city, gave our reporter yesterday a bit of thrilling personal experience in this line.

"I have crawled over red hot bars of iron and coals of fire," he said, "in my agony during an opium frenzy. The very thought of my sufferings freezes my blood and chills my bones. I was then eating over 30 grains of opium daily."

"How did you contract the habit?"

"Excessive business cares broke me down and my doctor prescribed opium! That is the way nine-tenths of cases commence. When I determined to stop, however, I found *I could not do it.*"

"You may be surprised to know," he said, "that two-fifths of the slaves of morphine and opium are physicians. Many of these I met. We studied our cases carefully. We found out what the organs were in which the appetite was developed and sustained; that no victim was free from a demoralized condition of those organs; *that the hope of a cure depended entirely upon the degree of vigor which could be imparted to them.* I have seen patients while undergoing treatment, compelled to resort to opium again to deaden the horrible pain in those orgrns. I marvel how I escaped."

"Do you mean to say, Mr. Wilson, that you have conquered the habit?"

"Indeed I have."

"Do you object to telling me how?"

"No, sir. Studying the matter with several opium-eating physicians, we became satisfied that the appetite for opium was located in the kidneys and liver. Our next object was to find a specific for restoring those organs to health. The physicians, much against their code, addressed their attention to a certain remedy and became thoroughly convinced on its scientific merits alone that it was the only one that could be relied upon in every case of disordered kidneys and liver. I thereupon began using it and, supplementing it with my own special treatment, finally got fully over the habit. I may say that the most important part of the treatment is to get those organs first into good working condition, for in them the appetite originates and is sustained, and in them over ninety per cent. of all other human ailments originate."

"For the last seven years this position has been taken by the proprietors of that remedy and finally it is becoming an acknowledged scientific truth among the medical profession; many of them, however, do not openly acknowledge it, and yet, knowing they have no other scientific specific, their code not allowing them to use it, they buy it upon the quiet and prescribe it in their own bottles."

"As I said before, the opium and morphine habits can never be cured until the appetite for them is routed out of the kidneys and liver. I have tried everything—experimented with everything, and as the result of my studies and investigation, I can say I *know* nothing can accomplish this result but Warner's safe cure."

"Have others tried your treatment?"

"Yes sir, many; and all who have followed it fully have recovered. Several of them who did not first treat their kidneys and liver for six or eight weeks, as I advised them, completely failed. This form of treatment is always insisted upon for all patients, whether treated by mail or at the Loveland Opium Institute, and supplemented by our special private treatment, *it always cures.*"

Mr. Wilson stands very high wherever known. His experience is only another proof of the wonderful and conceded power of Warner's safe cure over all diseases of the kidneys, liver and blood, and the diseases caused by derangements of those organs. We may say that it is very flattering to the proprietors of Warner's safe cure that it has received the highest medical endorsement and, after persistent study, it is admitted by scientists that there is nothing in materia medica for the restoration of those great organs that equals it in power. We take pleasure in publishing the above statements coming from so reliable a source as Mr. Wilson and confirming by personal experience what we have time and again published in our columns. We also extend to the proprietors our hearty congratulations on the results wrought.

PERSONALS.

GENERAL TOOMBS'S estate, recently settled, was worth $250,000.

QUEEN VICTORIA'S chicken house is a palatial, semi-gothic building.

GEN. SHERMAN has decided to make New York his home henceforth.

PRESIDENT CLEVELAND and Miss Frances Folsom were married at the White House, Washington, on Wednesday at 7 P. M.

WALT WHITMAN'S 67th birthday anniversary on Monday found him in the best of spirits, but in constantly failing physical powers.

GOVERNOR RUSK is almost certain to be renominated by the Republicans of Wisconsin, and Gabriel Bouck is likely to be the Democratic candidate.

THE wife of Senator Leland Stanford, of California, distributed $5,000 among the kindergartens of San Francisco on her recent birthday.

ENGLISH poet Browning calls "our own" Oliver Wendell Holmes "the Horace of America." Oliver is having a glorious time across the Atlantic.

THE Chicago Anarchists are trying to engage Ben Butler to defend them. Having no defense, they suppose Ben is the best man to manufacture one.

COL. DAN. LAMONT has won "golden opinions from all sorts and conditions of men," and especially of women, for the way he conducted that little ceremony at Washington.

ROSE ELIZABETH CLEVELAND, sister of the President, steps down from the proud position of "first lady of the land" with the good opinion and wishes of all.

"Our Mary" (Anderson) sailed for England Thursday afternoon, accompanied by her brother Joe and her inevitable stepfather, Dr. Griffin. Will take "a long rest." The gross "take-in" of her recent tour here was $312,000.

PRINCE JEROME NAPOLEON, it is said, will soon come to the United States, ostensibly to meet his son, who is returning by way of San Francisco and New York from his trip around the world.

SECRETARY CHAMBERLAIN, of the Ohio Board of Agriculture, is to be President Chamberlain soon, he having accepted a call from the trustees of the Iowa State Agricultural College to the presidency of that institution.

ANDREW CARNAGIE, the several times millionaire steel manufacturer, has given $500,000 to build, stock and endow a public library in Pitsburg, Pa., and $250,000 for the same purpose to Allegheny City, across the river from Pittsburg.

IN order to keep an engagement in Washington, Mrs. F. B. Thurber traveled last week from Pittsburg to Washington by special train within eight hours and 15 minutes. The distance between the two cities is 304 miles. The run was the fastest on record. Cost her $300; but she was on time.

THE infant King of Spain, having been born after his kingly father's death, enjoys the almost unique distinction of having been born a monarch. There is no other like instance in the history of Spain, nor of England. In France there has been one such incident, in the case of John I., in 1316.

WILLIAM L. SCOTT, of Erie, Pa., is the richest man in the House of Representatives, if not in Congress. Worth about $15,000,000; born in 1828; page in the House from 1840 to '46; began shipping business on the lakes in 1850, then went into iron and steel; now represents 22,000 miles of railroad. Always a Democrat.

GORDON S. HUBBARD, who is dying in Chicago at 85, was the first trader who ever furnished the Indians with supplies at that point, was Chicago's first pork packer, built the first Chicago warehouses, raised Perry's famous flag-ship, and with it and three other vessels founded the Eagle line, the beginning of Western lake commerce.

JOHN KELLY, Tammany "boss," with country-wide reputation as a politician, died quietly here Tuesday, June 1, after over a year's illness. Born here in 1822; alderman in 1844; Congressman in 1856; sheriff twice here; comptroller in 1876, and for the first time, since it began in 1760, reduced the city's debt. It was $112,000,000,000, and in his four years he cut off $12,000,000. A good epitaph now would be what he has been called for years—"Honest John Kelly."

AVERAGE hight of our Senators, five feet nine; average weight 175 pounds. Fattest and heaviest, Philetus Sawyer, of Wis., 250 pounds, or thereabouts. Stanford, of California; Beck, of Kentucky, and Eustis, of Louisana aggregate 600 pounds. Logan, of Illinois; Palmer, of Michigan; Jones, of Arkansas; George, of Mississippi, and Vest, of Missouri, average 180 pounds apiece. Evarts, Spooner, Eli Salsbury, H. B. Paine, Ingalls and Mahone are the leanest and lightest.

A SAFE FAMILY REMEDY.

ESPECIALLY SUITED FOR

BABES,

CHILDREN AND DELICATE PERSONS.

TROPIC FRUIT LAXATIVE

Entirely harmless and delicious to take. Tropic Fruit Laxative is unequalled for Constipation, Biliousness, Sick Headache, Loss of Appetite, Complaints of Children, and liver, stomach and bowel ailments generally.

Absolutely safe for delicate and nursing women. Taken eagerly by infants and children.

Ask for **Liquid Tropic-Fruit Laxative.** Price 25 cents per bottle. *Sold by Druggists.*

CORNELL UNIVERSITY.

AGRICULTURAL DEPARTMENT

In the year 1886-87 courses of instruction will be given as follows:

In Agricultural and Applied Chemistry; Professors CALDWELL, SCHAEFFER and NEWBERRY: 8 Courses.

In Botany, Horticulture and Arboriculture; Professors PRENTISS and DUDLEY: 11 Courses.

In Entomology and General Invertebrate Zoology; Professor COMSTOCK: 7 Courses.

In Geology; Professor H. S. WILLIAMS: 3 Courses.

In Veterinary Science; Professor LAW: 3 Courses.

In Applied Agriculture; Professor ROBERTS: 6 Courses.

During the present year a course of lectures is given on the Management of the Dairy by the Honorable L. B. Arnold; a similar course may be expected next year.

A veterinarian building is to be erected in the course of the present year, and four rooms are to be added to the Agricultural Laboratory and Museum.

The University Farm contains 257 acres, of which about 125 acres are in tillage. The farm contains two very large barns, a dairy house, and an excellent herd of stock. All the appliances of the Farm are used chiefly for the purposes of illustrative and experimental husbandry.

Students who take the full course and pass the requisite examinations receive the degree of Bachelor of Science in Agriculture.

Students not candidates for a degree are received without examination as "Special Students" and are admitted to any or all of the above courses, provided the applicants are 18 or more years of age; and provided they satisfy the Professors of Agriculture of their disposition and ability to profit by the instruction.

The next collegiate year begins September 14, 1886!

To all students of Agriculture "TUITION IS FREE."

Full information sent on application. Questions concerning courses of study should be addressed to I. P. ROBERTS, Professor of Agriculture; all other questions to E. L. WILLIAMS, TREASURER,
CORNELL UNIVERSITY, Ithaca, N. Y., May, 1886.

HORSE POWERS

LATEST IMPROVEMENT

Machines for THRESHING and CLEANING GRAIN; also Machines for SAWING WOOD with Circular and Cross-Cut Drag Saws.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XLV. No. 1899. NEW YORK, JUNE 19, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Architecture.

A BEAUTIFUL HOME.

RURAL readers will find much to interest them in an examination of the house illustrated at Figs. 253, '4 and '5. Such a building is well adapted to the needs of a country family. An examination of the plans for the first and second floors (p. 398) show that comfort and convenience have been most sought after. It will be noticed that the front door opens directly into the sitting-room, while the stairs are in the center of the house, away from the front door. We like this arrangement exceedingly. The house was planned and built by Mr. A. Freed, of Lancaster, Ohio, and cost not far from $5,000. Mr. F. writes us, concerning the internal arrangements, as follows: "The greatest convenience in the arrangement of my house, and one which the family would be least willing to be deprived of, is the method of supplying water. An abundance of rain water, both hot and cold, is ready for use in the bath-room for water-closet, wash stand or bath. The arrangement is this: the water is conducted as it falls from the roof by an iron pipe down through the building into the cellar, thence underground up a hill near the house into a cistern holding about 75 barrels. From the same pipe that conducts it to the cistern it is distributed first through the cook-stove to a tank, one pipe from the latter supplying hot water to the sink in the kitchen. Another, ascending to the second story, supplies the bath tub, and a branch from this leads to the wash-stand. The cold water is supplied from the "down" pipe in which the water always finds its level with that in the cistern on the hill. Other conveniences are a dumb-waiter and china cupboard in the wall between the dining-room and kitchen, with doors opening to both; also an elevator for carrying coal from the cellar to grates on first and second floors. In moderately cold weather, the halls, bath-room, dining-room, sitting-room, parlor and library are heated by hot water running through pipes which pass through a furnace in the cellar. This mode of heating here in the country is a new thing. The heat is distributed where it is needed without the inconveniences of stoves, dust and ashes. This mode of heating is cleanly and agreeable, but in very cold weather the heat is not sufficient to warm the house without the grates; but by the use of both methods, the rooms are very agreeably and comfortably heated."

A BEAUTIFUL HOME. Fig. 253.

Farm Topics.

CITY AND COUNTRY FOLKS.

CHARLES A. GREEN.

WHEN we first moved to our run-down farm we were constantly surprised by visits from merchants, lawyers and others, calling for the purpose of discussing what was best to be done with property in which all had a mutual interest, and by calls from other fashionable city friends and acquaintances. I was never at ease when entertaining these city friends. I have lived in the city myself, and know precisely how city people look upon the country and country folks. They live where money is spent lavishly upon gardens, pleasure grounds and drives by men whose rest is disturbed only by plans for distributing money, rather than gathering it. They come from the pavements, from front yards only a few feet in extent, kept mowed, ornamented and made attractive at small cost, if the owner is so disposed. These city people make a study of dress, manners, equipage and general appearance. When they drive out into the country they see everywhere evidences of economy and frugality. And when the city guests are seated about the parlor or dining table anyone could easily distinguish the residents of the country from those of the city. The unpretentious farmer points with some misgivings to the growing crops, to his cattle and horses, but the ill-conceived compliments that the city friends bestow are apt to grate harshly upon his ear, and he is apt to feel relieved when they depart. The farmer's horses are not made more beautiful by their work at the plow and harrow. It is sometimes the same with the farmer and his family. Their plodding in heavy boots, their hard work in bent positions, their faces discolored by the blaze of the hot summer's sun tell against the beautiful chiseling of the human form. Indeed, he must be a handsome man who can withstand a thorough tanning in the burning sun and yet retain his good looks. Genuine palor is certainly a badge of intellectuality. A man with a brown face may be as wise and acute as his untanned brother, but he does not have that appearance. It is not dignified to have a nose as red as a beet, or cheeks like leather. True nobility, however, will shine out through all these disadvantages.

There was once a wealthy banker who had taste for fruit growing, and liked nothing better than to get on his old clothes and work among the trees and plants. One day a man called at his house, desiring to interview him, not having found him at his office. Passing through the grounds he saw the gardener, apparently, who pleasantly bade him good afternoon. The visitor scorned to recognize the salute, but inquired gruffly if Mr. So-and-so was at home? Imagine the visitor's dismay a short time afterward, when the apparent gardener (really the banker) appeared in the drawing-room in answer to his call. The visitor had expected to negotiate an important loan. It is needless to state that he did not get it, and was taught a good lesson in good manners. While I would not like to over-estimate the value of dress and personal appearance, I must confess that in my opinion, people of rural districts do not give enough attention to this subject. It costs no more to dress in good taste than to dress in poor taste, but it requires more attention. I shall have to state, in closing, that rural people make altogether too much ado over their city guests. We should assume that city people go into the country for a change, and all attempts to give them other than good farmers' fare and accommodations are out of place and uncalled for. We cannot make the country like the city, nor can we appear like city people, and it is folly to attempt either. Let us take pride in being ourselves, not fearing that others will hold us in less esteem by such a course.

When I lived in the city, I drove into the country with a friend for a day's shooting. Becoming separated from my friend, and finding myself near the residence of an esteemed cousin, I called at the door for a bowl of bread and milk, which was my favorite dish. Imagine my surprise and horror when I found that the lady of the house had begun to spread an elaborate repast, tired as she doubtless was at that busy season. The table as usually set was cleared, china and silver were laid on snowy linen, and every delicacy at her disposal was placed before me. I felt guilty of a crime in thus trespassing, but knew that it was useless to protest. Can the reader doubt that I would have preferred my bowl of bread and milk, with more time to chat with my cousins, who were exceedingly interesting people?

Rochester, N. Y.

CORRESPONDENTS' VIEWS.

KEEP at the bogus butter makers and dealers until you drive them from the face of the earth. If you do, future generations will "rise up and call you blessed." By the way, why don't the bogus butter makers eat their own stuff? I notice most of them pay a big price for dairy butter to use on their own tables. L. P. S.

Rockford, Tenn.

SEVERAL stockmen near me are grading up their cattle somewhat. One man is using pedigree sires, and to some extent, dams. Short-horns are the favorites. His cattle are very fat and present a most marked appearance alongside of our natives. He sold yearlings this Spring at $62.50 per head, while the rest of us that sold any got only $8 per head.

McMillen Co., Texas. T. K. B.

MILKMEN are frequently troubled, during the summer months, by their milk souring. This is owing, no doubt, to the fact that they cannot cool it quickly enough after milking. Various plans are tried, like lowering the cans down the well, or placing them in a barrel surrounded with water. It would pay them to buy a creamer like the Cooley. These creamers are the best things in existence for cooling milk or for the retail trade. Milk can be kept sweet for several days, and a glass can be drawn at any time by simply turning a faucet. They are as valuable for the milk dairy as they are in butter making. W.

Windham Co., Vt.

LAST Fall I built a poultry house for my little boy, and started him in the business. I set posts in the ground about five feet apart, put streamers 2x4 inches on the outside of the posts, and put on white oak boxing an inch thick. The same thing went on the inside—nailed to the posts. The space between was filled with new sawdust packed tightly and firmly. This made a sawdust wall six inches thick. A light floor or loft was made above, and covered with six inches of sawdust; one large window at the south and two smaller at the end. In putting in the ceiling, it is best to nail on about two feet, beginning at the ground, and then fill this with sawdust before nailing on more. This house has been warm in the coldest weather. BUFORD.

Caldwell, Ky.

TOO many farmers neglect to bed the horses. They are foolish. A bed is needed even in Summer. Wheat straw is the best for this purpose. It is brittle, and the animal will not get his feet tangled up in it. Oat straw is too tough. Barley straw is too dusty. It causes irritation of the skin. A few straws will not answer. Give a good, soft bed. A. U. H.

Ashland Co., O.

CAPONIZING pays. The flesh of capons is decidedly sweeter and of finer flavor than that of cocks. They gain from two to four pounds in weight, while the cost of feeding is no more. If the farmer could once get a taste of a capon, there would be a great reduction in the number of roosters on his place. After capons have once been introduced into a market, there will be a great demand for them. A cross of the Dorking or Game on the common poultry will make a fine capon. The operation can be performed at any age, but from two to six months gives the best results. I do not see that the birds suffer much pain after the first incision. They lie motionless unless you touch their heads. To show how little people in general know about caponizing, I can relate a fact that came under my observation. At a poultry farm where I was visiting, a lady called and examined some capons. When told what they were, she said they were splendid birds, and asked the proprietor to be sure and send her some eggs. W. H. W.

Philadelphia, Pa.

IN the rush for chemical fertilizers let us never forget that good barnyard manure, all things considered, is the cheapest fertilizer we can find. Some writers spend long sentences trying to prove the inertness of green stable manure the first season after application. My experience does not show the same result. Grain-made dung that has been made to retain a fair proportion of the urine

even by the addition of great quantities of inert absorbents, with me shows good effects from the first application. It is surprising to see how quickly young corn plants will find it when merely plowed in moderate quantities into washed sterile clay soil. There is no doubt in my mind that grain-fed dung is quicker in its effects than dung from cattle fed on hay or straw alone. The addition of the urine has a marked influence on the activity of the manure. C. S. O.

Foristell, Me.

ITEMS of evidence showing that Holsteins combine to a wonderful degree the characteristics of beef and milk cattle, are the weights of the following descendants of Empress:—Holland milk record, 109 pounds in one day; American milk record, 19,714 pounds 4 ounces, in a year. Her dam's record in Holland is reported to be 114 pounds in one day.

Oswego, N. Y. DUDLEY MILLER.

As a soiling crop, rye has some merits, but I do not consider it by any means equal to clover or corn where these can be grown successfully. A fair crop of hay can be made from rye, if it is cut at the right time—just when coming into bloom. It will make a profitable hay crop in localities where Timothy and clover do not succeed. It would make a good hay plant for the South. For Winter and Spring pasture for sheep or calves, rye is excellent. It can be pastured with us, in the Spring until Blue Grass and clover are well started, and then make a fair crop of grain. We find the hardiness of rye to be one of its strongest recommendations. It will grow and flourish about anywhere, and on soils too poor to grow beans. K. B.

Kankakee Co., Ills.

I HAVE eaten fresh grapes of my own raising nine months of the past year, commencing with Champion and ending with Diana. The grapes were kept in hard-wood sawdust, in 20-pound grape baskets in an ordinary cellar. Victoria cuttings fail to grow alongside of others. Buds did not even swell while those of other vines grew. The buds were not well developed or matured. T. A. P.

So. Bend, Ind.

IN putting up a wire fence the corner post must be well braced to stand the pull given in stretching. We take a brace 14 feet long and put in the second post so that the brace will just come to its foot. Then stretch a wire from the foot of corner post to the top of second post. Place top end of brace just under where the top wire will come. Posts braced in this way, will not "raise." To stretch the wires, we brace the corner posts as above described. Drive a wagon about eight or 10 feet past the post you want to stretch to, with the inside wheel on a line with the fence. Let the tongue down, and drive a post-bar into the ground at the end of the tongue. Fasten the tongue at the bar in the ground—a stay chain is best for the purpose. Put a piece of board or a wagon-jack under the hind axle of the wagon so that the wheel nearest the line will clear the ground. Fasten the wire to the spoke or hub and turn the wheel until the wire is as tight as desired, and then staple it securely. My man and I have stretched and stapled a mile of fence—three wires—in this way in one day. On level land one quarter of a mile can be stretched at one time.

Chase Co., Kan. W. L. B. N.

SOME agricultural papers tell us that ashes sifted over currant bushes, will kill or drive away the currant worms. I have tried it four times with good unleached hickory ashes, and it will not do any such thing. My worms fatten on this treatment. My plan is to pick off every leaf that has turned red and rolled up, and burn them. If you can't do it yourself, hire some boys to help you. "Workman" talks about "oniony" milk in a recent issue. He can make sure of one thing at least—he has been eating genuine butter for once. No "oleo" would be flavored in that way. Don't dig up the garlic, let it stay and thus make a sure test for pure butter. Or would you rather have the "oleo" without the garlic?

Brightwood Ind. W. H. L.

Sheep Husbandry.

Notes from the Western New York Farm.

LAMB FEEDING.

EARLY vs. LATE-CUT HAY.

ALTHOUGH I have before spoken of the advantages of early-cut hay, yet as the haying season is at hand, and the difference is so much in favor of early cutting, I again refer to this subject. I have in mind two lots of clover hay: the one was of large growth with coarse stalks, and yet the lambs ate it clean, even to the coarsest stalks. The other was much finer and apparently much better, but the lambs would eat nothing but the leaves and heads. On tasting, I found the coarse stalks of the one filled with sweetness: stalks of the other, though much smaller, were coarse and woody. On inquiry I learned that the first, for fear of lodging, was cut a little before it was in full bloom; while the other was left until regulation time, or until a half or more of the heads "were brown." The first was cheap at the price ($8.00 per ton), and lambs would have wintered in good order if fed only such hay and plenty of roots, and kept in warm stables. The other would have been dear at $6.00, and the lambs would not eat enough of it to have kept in good condition. The same is true of Timothy hay, only in a more marked degree, because a larger proportion of its nutritive value is contained in the stalks and stems.

My father was once a firm believer in the superior value of well-matured hay, and would cut his only when at least one-half the seed was ripe enough to grow. Once, when he was from home, I commenced the haying, and cut several tons when in full bloom. On his return the haying was stopped until, as he thought, the proper season; when Winter came I was told that the reason for the stock eating the early-cut hay so much the more readily was because of its want of substance, making it necessary for them to eat the more of it. I could convince him that it was because of its greater palatability, and that it was really better, only by an actual feeding test of several weeks' duration.

The philosophy of the difference is plain enough when we consider the sequence of growth. The plant takes its mineral matter, including its phosphoric acid, its nitrogen, hydrogen, and oxygen, entirely from the soil, while its carbon comes mostly (probably entirely) from the air. Sugar, gum, starch, and woody-fiber, while differing so widely in digestibility and nutritive value, are strikingly similar in chemical composition, and are evolved in the process of growth the one from the other. When just coming into bloom grass contains a large proportion of sugar and gum, the more easily digestible; but these, as the plants mature, are rapidly changed into starch, and later into woody fiber. In this condition not only do they become much less digestible and lose much of their nutritive value, but much of the nitrogenous matter is locked up in the close embrace of the woody fiber.

It is really strange to hear the superiority of early cut hay so universally conceded by all careful feeders, while nearly all hay is allowed to stand over until ripe. Probably one reason of this is, that with the most improved machinery it takes several days, and in bad weather, weeks even, to cut all the meadow, and when people wait before beginning until the grass is wholly fit, much of the crop is sure to get far too ripe before it is cut. Since I have so often in my own experience proven that lambs will not thrive to the best advantage on anything but the earliest cut hay, I would strongly urge upon every one intending to engage in lamb feeding, the importance of closely watching the meadows, and of cutting the clover even a little before the fields are in "full color."

WITHIN two weeks we shall be cutting clover on an early rich field, and shall probably cut it three times this Summer, especially "lamb hay." It excels everything else for young lambs.

The field of hand-picked Diehl-Mediterranean Wheat is a sight. It was sown with a scant bushel per acre, but is now over waist-high, as "thick as a mat," and bids fair to go away above 40 bushels per acre. This is a magnificent wheat, and its introduction has been worth millions to the country; yet being a crossbred, it still sports, and requires careful selection by hand-picking to fix its type so as to be uniform. This field has been hand-picked twice, and I am anxious to see if it will still show "bald heads."

Yesterday I tried the Aspinwall potato-planter, made at Three Rivers, Mich. It opens the furrow, drops the pieces of potato, one in a place, and at any distance from 10 to 90 inches apart, puts a little soil, then the fertilizer, and then more soil on the seeds, leaving a ridge from two to three inches above the level of the surface. It does not miss one hill in 50, and seldom drops more than one piece in a place. One man and a team planted, using phosphate, five acres in a day easily, and could have done much more if crowded. I mention this, not to boom the machine or to puff the makers, but I can recognize merit when I see it, and this machine shows the result of much study, and is a jewel to every person raising a half dozen acres of this valuable crop each year. It has almost human intelligence, and I say success to the man who invented it. J. S. WOODWARD.

Dairy Husbandry.

"WITCHES IN THE CHURN."

T. D. CURTIS.

A CORRESPONDENT writing from Cicero, N Y., says that he used a portable creamery during the Summer with good results, but when cold weather came on he at times found it impossible to make the butter come. The milk was set at a temperature of 40 degrees for 12 hours, and the cream was kept at 60 degrees until slightly sour, and then churned at 62 degrees. He wants to know what was the matter with the creamery, as when the milk was scalded and set in pans there was no difficulty in churning the cream.

There was nothing the matter with the creamery, so far as appears from these facts. The trouble was evidently with the temperature of the cream. As a rule, milk is more albuminous in Winter, or when it is cold in the Fall and Spring, than it is in the Summer. Chilling the cows by standing out in the cold, or by leaving a warm stable to encounter the cold air, or by gorging with ice-cold water, causes an excessive secretion of albumen in the milk. Any sudden shock to the cow's system, sickness of the cow, and other derangement for some reason cause this excess of albumen. Hence, we suspect that our correspondent's cows in some way suffered from exposure to the cold; that this increased the proportion of albumen in the milk: that this albumen adhered to the butter globules and interfered with churning; that in consequence his cream was viscous and ropy and that scalding the milk when set in pans congulated the albumen and left the butter globules free or freer to unite and coalesce in the form of butter. If the milk had been scalded before setting in the creamery, it would have churned the same as when set in the pans—although we do not know precisely what the effect is of running the temperature down to 40 deg.; in his pans it probably did not go so low. If he had diluted his cream with warm water quite considerably, we think it would have facilitated the churning, as would also churning at a higher temperature. If he has such trouble again, let him try the temperature of 64 or 65 degrees, and up even as high as 70 degrees. It will do no harm, even if the butter does not come; if it does, he will learn something.

We have recently got some new light on the character of the butter globule. It has appeared in the report of the New York Experiment Station. During last Summer, Dr. Babcock was experimenting with milk fats and other fats, and found that the milk fats are liquid globules, pure and simple, without membranous covering, and that at a certain temperature they will break up by churning, without changing their appearance in the

least, save as to size. At another temperature, they remain unchanged under the operations of the churn; while at an intermediate temperature between these, they readily coalesce by churning and appear as butter. He was able to take milk with small cream globules and convert them into large ones, but correspondingly less in number; and by churning at another temperature, he could make the large cream globules in milk smaller and correspondingly increase their number. He made emulsions of other fats, the globules of which appeared under the microscope the same as the butter globules, and he could unite and divide them in the same way, and also churn them into the consistency of butter. But he had to observe a particular temperature for each kind of fat. This is why temperature is so important in churning. If the temperature is too light, the butter globules are broken up and reduced in size. If the temperature is too low, they refuse to adhere together, and no butter comes. The right medium temperature makes the churning easy.

As albumen is a constant element in milk—less just after the cow calves and during warm weather, and more in proportion in cold weather—it is inferred that this, being the most viscous, is the one that clings most tenaciously to the butter globule, giving it the appearance of a thin membrane. The churning presses the globule from this entanglement before it can unite with its fellow and congeal into butter. Prof. Arnold thinks the butter globule remains liquid until broken in the watery serum, which rapidly conducts off the heat and allows the globules to blend together and congeal in the form of butter, if the temperature is right. If it is too high, they only break and divide. If too low, they do not break at all, but remain enveloped in the viscid albumen. Hence the advantage, when the albumen is in excess, of churning at a higher temperature and of diluting the cream with warm water. It makes the whole mass more limpid, and allows the fat globules to free themselves from the albumen. This is the best light we are now able to throw on the subject.

The Poultry Yard.

POULTRY AT THE SOUTH.

THE Plymouth Rocks are, in my opinion, by far the best birds for this climate, both for the fancier and for the general farmer. They are hardy, thrifty and prolific. Langshans and Brahmas do well here, as do the Games. Any of the above will be profitable with fair treatment. The Polish, Houdans and other breeds with excessive feathering are delicate and almost worthless. Leghorns are healthy and prolific after reaching maturity, but delicate and hard to raise unless hatched very early. All sorts of geese thrive with us and can be raised at little or no expense. Fortunes can be made at geese farming. I can raise a ton of geese feathers for less money than one could produce a ton of wool.

I do not think this climate is as bad for poultry diseases as a colder one would be. If Northern poultry should be treated as badly as ours are, there would be none left at the North. We have but little roup and cholera, and only from neglect and filth. Our worst disease for little chicks is gapes, and I have seldom noticed that outside of filthy runs. Northern and Southern specimens of the same breed do not differ, except in development.

With the same care, we can grow a larger bird from the fact that all birds delight in warm weather—when not excessively warm. All birds, in their natural state, hatch their young in warm weather. Every poultryman knows that cold weather is death to young birds, and even when birds are fully feathered they will not grow in cold weather as they will in warm. Hence, I conclude that as we have nine months of warm, growing weather, we can raise a better bird that can those who live in a cold country where there are three months more of colder weather. Many Fall-hatched chicks are caught by the cold, and stunted, and consequently never reach their full size. Another reason why we can produce larger chickens in a warm climate lies in the fact that bugs and worms abound for a longer period of time. These are the natural food of birds and essential to their health and development. Again, the tender, growing vegetation is spread before fowls for a longer period of time. Chopped meat and vegetables will not so completely meet the tastes and requirements of a bird as the living and growing animal and vegetable life. Birds have no stomachs, and consequently no gastric juice. Owing to the fact that we have an abundance of insects, fruits, grass and seeds during nearly the entire year, we can raise our fowls for one-fourth the cost in a colder climate, yet, to our shame be it said, we buy both eggs and poultry away from home.

I would never advise a friend to buy eggs. Fanciers never buy eggs except now and then to secure a few chicks from an exceptionally fine cock. I would advise a farmer to kill all his old roosters, buy a pair or trio of good Plymouth Rocks, and keep the one or two hens laying all through the year, setting the eggs under his common hens. He could watch their nests and thus secure their eggs. From a trio of Plymouth Rocks a farmer could, with fair success, raise 125 chickens. This would give him at least 50 good hens, and enough to warrant him in killing off all the scrubs. He will have a flock of fine birds as much above the common stock as a race horse is above a Texan pony. If he should buy eggs he will be just one year behind his more enterprising neighbors. If he buys one or two settings, but a part of the eggs will hatch, and he runs the risk of trying to rear a lot of in-bred and poorly mated chickens, and perhaps not enough hens to do away with the common stock. A trio of chickens worth, say $10, will produce in a year 20 dozens of eggs, worth at least one dollar per dozen. The man, therefore, who buys chickens instead of eggs, gets his eggs for half price, and still has a fine trio of fowls on hand. It costs more to start in this way, but I think it pays best in the end.

Baton Rouge, La. W. W. GARIG.

MINORCAS.

THE Black and White Minorcas are new and valuable additions to the many varieties of poultry we already have in this country. Mr. Stephen Beales, one of the best known and ablest English writers, says: "These varieties have been very carefully bred for very many years in the south of England, outside of which, until recently, they were scarcely known; but now their great value as layers has made them very popular indeed all over the country, and they promise to become first favorites in this respect. Nor can we wonder at it, for their great fecundity, the large eggs they produce, their precocity and hardiness, their adaptability for all soils and places, whether confined or otherwise, make them one of the most useful breeds we possess, and, being non-sitters, we must give them the first position among all the laying breeds of poultry." The Minorca is a stylish bird, with stately, upright carriage, close, compact body and of a stout, square build. Their combs are large and single, earlaps white, and face coral red. They are very hardy either as fowls or chicks, and mature early, the pullets laying when 18 to 20 weeks old. They are small eaters and splendid foragers, and I believe will become great favorites, especially among the farmers.

There have been four importations this year, three for prominent breeders in Pennsylvania and one for one of the leading breeders in Maine, each having a fine breeding yard of the Blacks. The White Minorcas are very scarce, and but few have been imported. I predict for those few breeders of Minorcas a very ready sale for all the chicks they may raise this year, as this is surely one of the best fowls we now have in this country, and as true merit will always win, they will speedily come to the front. Pomological.

"HARDINESS OF FRUITS."

PROF. J. L. BUDD.

THE general conclusion reached by Mr. T. T. Lyon, in the RURAL of May 1st, in regard to the need of foliage that will maintain perfect health during our summer extremes of heat and relative moisture of air, cannot be questioned; but it occurs to Western readers that habit of determinate growth and perfect hibernating in Winter should be considered in the same connection. To illustrate the harmony of theory and practice, the behavior of the great variety of ligneous plants on the Iowa Agricultural College grounds during the past three peculiarly severe Winters and Summers may have some interest.

The behavior in Central Iowa of the cherries and pears of Vladimir and Kazan Russia, perfectly illustrate the correctness of Mr. Lyon's views. In their native clime they endure a winter temperature of from 40 to 50 degrees below zero, while with us they have been injured or killed at a temperature of 30 degrees below, for the reason that their foliage will not stand our dry summer heat. Last August I failed to find a perfect leaf on a single variety of the cherry or wild pear from this coldest orchard-growing region of the world; yet, in Northern Dakota, and in Manitoba, they will prove specially valuable. On the other hand, varieties of the apple, pear, cherry, plum, forest trees, and shrubs, from Eastern Central Russia, 400 to 600 miles farther south, seem as hardy with us as our native forest trees. Nature seems to have fitted this oldest orcharding region of the world for developing all the requisites of what we call an iron-clad tree. The alternate play of the winds from the deserts on the east and southeast, from the inland seas and the Baltic on the west and southwest, and from the cold, dry tundras of the far north, has given the leaves of all plants from two to three more layers of palisade cells than are found in those of plants 600 miles farther north, or in any of the indigenous plants of Southwest Europe.

Observation also shows that the epidermis of bark, and all the parts of the flower, have been equally fitted for enduring periods of extreme heat and aridity of air, or extremes of moisture or abnormal cold. With the aid of Dr. Halstead and some members of the junior class, I have for the last two days been engaged in pollenizing the flowers of plums and cherries, with a view to the possible uniting of desirable points as to tree and fruit. The superior thickness and firmness of petals, thickness of stamens and pistils, and strength and firmness of anthers and stigmas have been constant subjects of remark in all fruits from this region.

Again, the constant dry autumns of this interior section, in accordance with a well known law, have in time developed in all woody plants another essential of the true iron-clad, viz., a habit of determinate growth as fixed and constant as that of the currant bush or the Duchess apple. A third essential of the hardy tree is what Mr. R. P. Speer calls "capacity for perfect winter hibernation." The currant, the lilac, and most of our indigenous trees have this capacity for perfect rest, undisturbed by our spells of genial warmth and rain of late Fall, mid-Winter, or early Spring. Possibly the law of survival of the fittest, or some climatic peculiarity has developed this essential in about all the plants of the East Plain south of Simbirsk on the Volga.

Ames, Iowa.

Horticultural.

HIGH FERTILIZATION AND CULTURE,

AS AFFECTING THE GROWTH AND FRUITAGE OF PLANTS ON THE BASIS OF ECONOMY.

Profit the only object of the commercial grower; conditions affecting the value of high manuring; the soil as a bank of deposit; varieties best adapted to high manuring; how to get the best varieties; difficulties.

P. M. AUGUR.

WHATEVER may be the possibilities of size and yield and growth of plant to the amateur, these matter not to the commercial grower if not compatible with clear economic investment. Look at the matter as we may, the question will arise, "Will it pay?" This is the test by which the whole matter must be settled.

To what extent, then, is high manuring and high culture profitable? Regarding the question from this stand-point, a variety of conditions confront us—the variety in hand, the present and prospective condition of the land, the market demand, the cost of labor, the cost of fertilizers, the enhanced value of the land worked, and the consequent profit or loss by extra outlay of capital in manuring and culture. I am a believer in the idea that what is worth doing, is worth doing well.

In any agricultural or horticultural product the variety raised is a matter of prime importance. With an animal, a good respiratory and digestive system, so that every pound of food does the most good, producing best results, is what is needed. Just this, too, is needed in a variety of vegetable or fruit. And it may be truly said that as good breeds and good breeding are important with the successful animal, no less so are good varieties, and careful retaining of vital points, with the vegetable or fruit. Analogy between the animal and vegetable in these respects is strikingly close. For high culture, then, we need only those varieties which respond generously to such treatment. Fortunately we are not without such varieties.

As regards the present and prospective value of the land, a retentive soil properly drained and subsoiled, is nearly as safe a place of deposit as a sound bank of discount; hence, if we wish to make heavy drafts we must make liberal deposits, knowing that what we do not draw out now will remain for future use. I fully believe that heavy manuring last year has an added value this year, especially for the strawberry, the manure having in the interval become much more available for plant food. Composting does for green manure what yeast does for flour, and no good cultivator can forego its advantages. An application of from 30 to 50 cords of stable manure per acre on land well adapted for the application, to be planted to the most productive varieties of strawberries, is positively on the basis of economy. A given amount of composted stable manure, put on evenly at three different dressings, the whole being plowed in each time, and 10 days after each plowing crossed thoroughly with an Acme harrow, makes a splendid preparation for strawberries; but if large berries are objected to, don't try this plan; but if your policy is to drive small berries out of market, the plan will work well. It seems like using considerable manure and, indeed, if I were to plant the field to the Bidwell or Crescent, I would use less, but for the Sharpless or Jewell it is all right, and the two go well together. To secure the heaviest yield possible my plan would be to plant four rows of Jewell to one of Sharpless, or to make the field all Jewells except the first, sixth, 11th, 16th and 21st rows, and so on. My experience shows that this proportion is all-sufficient for complete fertilization of the flowers, and as the Jewell is most productive, I give that the larger space.

To obtain the largest attainable yield under high culture, I would have my propagating bed on rich land planted in Autumn, or very early Spring; I would allow no blossoms, and secure as a result, with good culture, early plants. On rich prepared land, plant as early in July as you get a sufficiency of plants; set them 24 by 18 inches apart and keep off all runners. The immediate results of such a course will gratify the planter, and surprise his neighbors; but the greater surprise will be in the fruiting season, when the profusion of large, bright berries will indeed be a marvel. Under the foregoing plan the maximum yield per plant should reach two quarts, with an average yield of one quart or more; but to reach this, there must be no slip-shod management. As in the solution of a problem in mathematics, every step must be right, in which case the solution will be right. With such a yield selling at 15 cents per quart, the gross returns would exceed $2,000 per acre, or at 12 cents per quart, the income would exceed $1,700 per acre. But observe that to do this, the land, the manuring, the management, the variety, the season and the marketing must all be right. Let no novice expect that he is to step right into such success, the first time; if he did, it would be the greatest marvel of all.

There are difficulties to encounter: the grub may destroy some plants; other insect enemies may do damage; drought may cut short the yield, and in many ways there may be disappointment. So it is never best to count chickens before they are hatched. But I have fully concluded that high culture and expert management are on the basis of true economy in any agricultural product, but nowhere more so than in the production of small fruits.

Middlefield, Conn.

STRAWBERRIES FROM SEED.

THERE are probably but few growers of the strawberry who have not been the victims of the tree agent or a well-written advertisement extolling the merits of this or that "best berry in the world." A few years ago, at our county fair, some very large berries were on exhibition. "They were new, not on the market," but "to oblige," etc., the exhibitor "would sell a few at $5 per dozen," and many bought at that price. A year later there wasn't one of them who wouldn't sell the stock at $5 per 1,000.

Thinking what one could do, another might, I selected a half dozen of the finest berries, and started to raise new varieties, and the next year I had 75 seedlings to plant out. The result was that 10 were good, four very good, and some medium. Of these seedlings I still have three.

At the next year's fair E. P. Roe had a very fine exhibit. Thinking as the fruit was from his trial grounds, there was a better chance for cross-fertilization, I selected those having the most desirable characteristics: result, 150 plants, and none really poor. At least 50 very good, which I continued to grow, dropping some each year, until I now have 15 kinds. They have always had common care, such as the average grower would give to acres, as I determined they should stand on their own good behavior. I have planted many leading varieties under the same treatment, and have a pride in seeing the new surpass the old. The Winter before last was very hard on unprotected berries. With us Sharpless, Bidwell, Atlantic, Prince, and Warren were all surpassed in hardiness by my own seedlings.

The object of this letter is to induce all growers to raise each year a few seedlings. Any one who has intelligence enough to grow an acre of strawberries, has enough to raise his own plants from seeds. My advice is, get a dozen varieties of the best kinds for your locality; plant them close; care for them well; select the best fruit of each kind; plant the seed mixed in sand in a shallow box; fill near-

ly to the top with good soil. When the plants have rough leaves, prick out for more room, winter in a cold-frame, or under a covering of evergreen boughs. In the Spring, when you plant for your crop, plant a row of the seedlings throughout the center. You will get enough fruit to pay for all the work done, and the chances are good that there will be some very choice sorts. You have the advantage of an experiment with 100 or more varieties at once, that have cost you nothing and will be more likely to give satisfaction than kinds grown on soil entirely different from yours, and stimulated to the fullest capacity of an ambitious culturist or nurserymau.

The Vineyard.

HOME-MADE BAGS FOR GRAPES.

Mr. James Dougal (Ontario, Can.) favors us with a plan (see Figs. 256-257) of making bags for covering grapes, which, with little explanation, will be understood by the sketches. No. 1 shows the way to cut and fold the

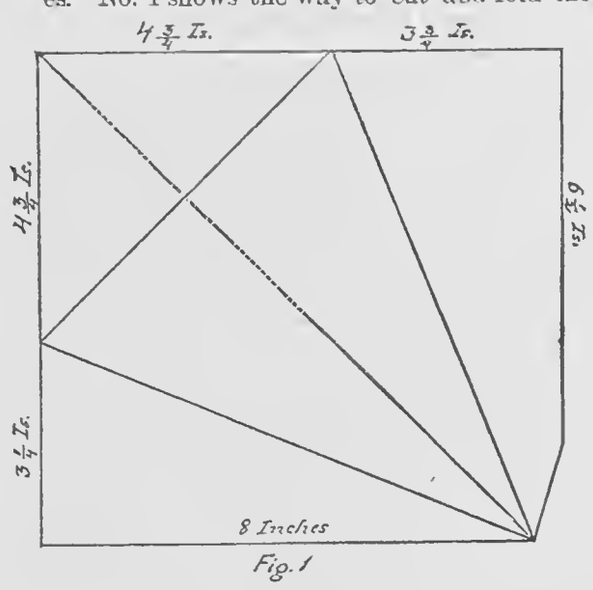

Fig. 1

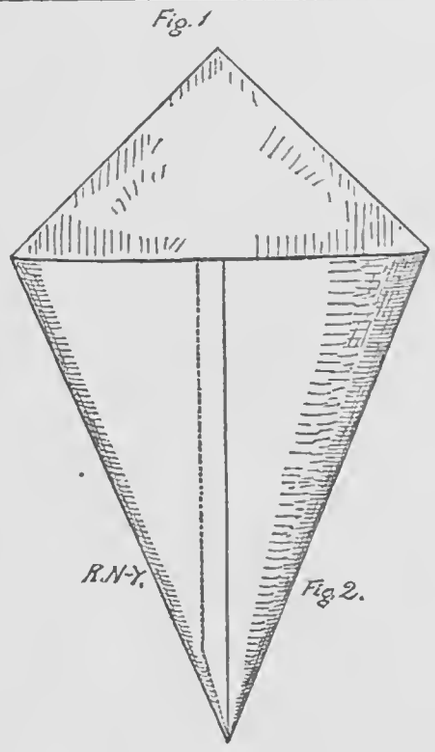

Figs. 256 and 257.

paper; No. 2, the finished bag. The lid or top of the bag must be cut through, so as to make a place for the stem of the bunch, and this should be done with a sharp knife or pair of scissors after the bunch is in the bag. The lid may then be carried over the branch and securely pinned to the bag itself. It is well to cut off the tip end of the bottom of the bag so that any rain that beats into the bag may escape at once. We have never used this form of bag, and cannot, therefore, say from experience, whether it is more or less convenient than the form generally used.

Farm Economy.

A BARREL LIFTER.

Mr. Benj. Macomber sends us the sketch shown at Fig. 259. The implement is designed for carrying open barrels of apples or vegetables from place to place. It can also be

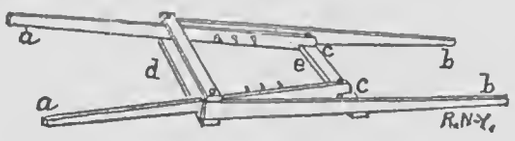

Fig. 259.

made to take the place of a hand-barrow. The four handles, *a a* and *b b*, are four feet two inches in length. The cross-piece, *e*, is firmly bolted to the handles, *b b*, also two cross-pieces, *d*, are bolted to the same handles, one above and the other below, leaving ample space between for the handles. *a a*, to be easily moved. The handles, *a a*, are bolted to the cross-piece, *e*, at *c c*, so loosely that they can be moved as on a hinge. The handles, *a a*, have spikes in them, as shown. To carry a barrel, the handles, *a a*, are spread, and the barrels placed between them. The spikes pass just below the bilge, and the handles are then pressed together, and two men can carry the load with ease.

HAY-RACK SEAT.

Mr. T. H. Rood, of Wyoming County, N. Y., sends the design shown at Fig. 258. All farmers know how hard it is to find a comfortable seat on a hay rack. One must sit at the side and be well shaken, or stand in the center.

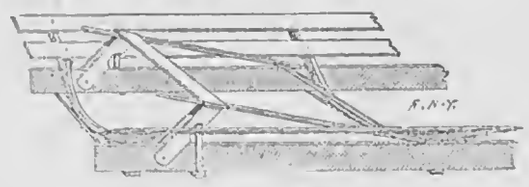

Fig. 258.

It frequently happens that farmers have to haul hay or grain half a mile. In such trips a good seat would be a great convenience. In the figure shown the standard is turned back. The supports are bolted to the wagon bed so that they will turn. As will be seen, the seat is a narrow board nailed to the standard posts. When the field is reached the standard is raised in front. The supports turn on the bolts and form a brace against the standard. The hay holds the standard in place, and when the load has been removed the seat can again be formed.

Field Crops.

MAKING AND PRESERVING PERMANENT MEADOWS.

HENRY STEWART.

Immemorial meadows in this country; grass an exacting crop; preparation of the land; seeding; mixture of varieties; when to sow; seeding with grain; practical directions.

Very little is known on this continent about permanent meadows: but there is a widely prevalent opinion that the American climate is unsuitable and even adverse to the successful permanent growth of grass. That this opinion is wholly unfounded, is proved by the fact that there are millions of acres of grass lands in the Western States and Territories, which have been productive for ages, and will continue to be: that countless thousands of buffaloes and antelopes have pastured and bred upon these great plains no one knows how long, and now that the ruthless hunter has exterminated these herds, millions of cattle have taken their place, and there is room for millions more. In Ohio, Indiana, Kentucky, Arkansas, Louisiana, Texas, Florida and other Southern States, there are meadows which have never yet been plowed, and yet bear annual crops of grass. The Blue Grass pastures of Kentucky, Ohio, and Indiana afford instances of permanent grass fields, which are not surpassed by any of those historical pastures of England, in regard to one of which Sir J. B. Lawes recently wrote that it had been in grass for centuries undisturbed. Some of these American and English meadows are able to fatten one ox per acre.

But there is other evidence than these analogous instances to prove that American farmers can have permanent meadows and pastures if they will take the pains to prepare the land in the right manner and feed the soil adequately, and get rid of the old idea that the only use of grass is to cut two or three crops of hay, to pasture it a year or so, and then, when it "runs out" and becomes full of moss and weeds from extreme starvation, to plow it under and, after further exhausting the soil by crops of corn, oats, wheat or rye, to seed down again with the belief that the grass and clover "rest the land." This idea is to be wholly obliterated from the mind of a farmer who desires to grow grass as it may be grown, and the fact be strongly impressed upon him that grass is an exacting crop upon the soil and must be prepared for and fed and nursed as much as any other crop grown. And to prove that under these circumstances permanently productive meadows may be made, there are abundant instances. Orchard Grass sown 25 or more years ago, is still as productive as ever and yields hay and pasture, both, yearly, with a liberal top-dressing and reseeding occasionally.

The whole secret is in the preparation of the soil, and the selection of the proper kind of grass. When an English farmer prepares to seed permanent grass, he grows a crop of roots, manures the ground abundantly and cultivates it thoroughly, destroying every weed that appears above the surface. Then the land is summer-fallowed and worked over several times, and again every weed is killed. A liberal application of artificial fertilizers is given, a ton of ground bones, 1,000 pounds of superphosphate, or of Peruvian guano per acre being frequently used, and there is no stint of seed, three or four times as much as we niggardly use, being sown. The seed is sown with great care, and is harrowed in patiently with a special kind of harrow, and the surface is rolled and brought to a perfect condition of smoothness, as well as of fertility; $25 to $35 per acre are often thus expended by an English farmer in putting in grass, and it well repays him in a continuous yield of three or four tons of hay per acre for many years.

Grass is, in fact, the most valuable crop. I have cut Orchard Grass over five feet high early in June, which had been sown eight years, and it made four tons of hay per acre, worth $25 per ton, and every year the grass was pastured from September until the snow covered it. Then the English farmer feeds his grass. When visiting an extensive farmer in England more than 30 years ago, when Peruvian guano was comparatively new, and very dear, I passed over one of his meadows and noticed the pungent odor of the guano. The small lumps of it were thickly scattered over the grass—the ground was invisible, being densely covered with the luxuriant herbage in early Spring—and there must have been at least half a ton used to the acre. On inquiry, I was told the grass had been top-dressed the Fall before, after the second mowing, with a ton of bone dust per acre. Besides this, occasional top-dressings of rich compost were given. In this meadow there were Sweet-scented Vernal; Meadow Fescues; Meadow Foxtail; Timothy; Orchard Grass; Kentucky Blue Grass; Italian Rye Grass; Perennial Rye Grass; Oat Grass; Red Top; Rough-stalked Meadow Grass and some others which I can not now recall, besides Red and White Clover and Rib Grass, (Narrow-leafed Plantain) considered then valuable for pasture for sheep, a large flock of which were kept on this farm.

If the same pains were taken here as there, the same results might be reached. I have for years past adopted fall sowing as in every way preferable to spring sowing, and the seed is sown alone and without any foster crop to rob it of food, light and air in return for the very questionable shelter afforded. Shelter is required only when the seed is scattered on the surface and not covered with soil, and the weak rootlets are sprawling on the ground in the effort to find a place to enter, and the tender seed leaves are waiting for the roots to get into the soil to feed them. Then one day's hot sunshine upon the unprotected rootlets kills them, or a few dry days cause them to perish, and the disappointed farmer finds "the seed has failed to catch." On the other hand, when the seed is properly covered in the fine, rich, mellow soil, the roots find their way to their food at once, and being well supplied with moisture, dry weather and hot sun don't hurt them.

An oat or rye stubble may be prepared for grass sowing as follows: It is first well dressed with manure, prepared for it, made fine and partly decomposed. This is plowed in, by lap furrows, set at an angle of 45 degrees and not turned over flat. The plowing should be eight inches deep, if the soil is well enriched to that depth: and if it is not, it is better not to try to put down the land to permanent grass at present, until it is adequately fertile. As soon as the land is plowed and while it is moist and pulverulent it is thoroughly harrowed, first along the furrows and then diagonally across them, until the field has been covered. This method secures a thorough mixing of the soil and the manures, and gives three separate workings, which bring the land to a fine mellow and yet compact texture well adapted to the reception of the very fine seeds of the various grasses.

The ground is made ready by the first of August when the seed is sown alone; or if it is thought better to give some shade and protection, a pound per acre of turnip seed is sown with it. The seed is covered in with a light harrow having short teeth not over three inches long, sloping back at an angle of 60 degrees. A harrow so made passes over the surface smoothly, tearing up nothing from under it; and as the teeth sink in the soil the frame of the harrow is dragged over the surface, smoothing it and covering the seed perfectly to a sufficient depth and no more. From a great many experiments with grass seed, I have concluded that one inch is the best depth to have it covered. At this depth the roots are well developed before the spire appears, like a hair, almost invisible on the surface, and dry weather has no injurious effect upon them. This is the great advantage of this method of seeding. The manner of sowing, amount of seed and the kinds most desirable will be referred to in another article.

SOME POTATOES.

In the Rural of May 20th, page 300, a correspondent has a good word to say for the Snowflake Potato. So far as size, quality and appearance are concerned, it deserves all that can be said in its praise. It is also an excellent keeping sort, but it has one fault that will prevent it from being extensively grown—it is not productive enough to render the crop profitable [That is our experience.—Eds.]. After testing many varieties I have come to the conclusion that there is none better for the late or general crop than the White Star, and for early use one cannot do better than to select the Early Ohio. I prefer the White Star to any other sort. Its white flesh and fine, floury texture, combined with its enormous productiveness and the uniform size of its tubers, are qualities to be desired.—[The Early Ohio is a small yielder in many places. We agree with our correspondent as to the White Star.—Eds.]

C. E. P.

The Apiarian.

BEE-KEEPING FOR FARMERS.

W. Z. HUTCHINSON.

I approve of the division of labor. I believe that specialties in rural pursuits are more profitable in the long run. I think that there are many things that the ordinary farmer can buy to better advantage than he can produce them. Among other things, I believe that the farmer can raise his honey more cheaply in his potato, corn or wheat fields. The busy time with bees—swarming—comes during the haying and harvesting. It does not pay to allow the mower, reaper or self-binder to stand idle in the back lot, while one-half or three-fourths of an hour is spent in coming to the house to hive a swarm of bees.

But we must take things as we find them, not as we wish them to be, and comfort ourselves with the thought that many little children now eat honey, who would seldom taste it did not their farmer father keep bees. There are many farmers who yet keep bees, and probably will continue to keep them—so fascinating to some is the pursuit—even though they could buy their honey more cheaply than they produce it. It is to assist this class that I now write.

The advantage of producing comb or extracted honey depends upon circumstances—the amount of time that can be given, and the season at which it can be given, etc. If some member of the family, as, for instance, an old man, or some one of the older children, takes an interest in the bees, it is quite an important factor, but let us suppose that the farmer himself must care for the bees. If he has as many as 20 colonies to care for, it will pay him, and pay him well, to hire an extra hand during June and July, as the crop of honey that would be lost by a few days' neglect, might be worth more than the few acres of hay or wheat saved by neglecting the bees.

As usually managed, more extracted than comb honey can be secured, while by the use of the extractor the disposition to swarm is greatly lessened, but, in order to keep down the "swarming fever," the extracting must be done often; while it is much less labor, or rather there is less work to be done during the busy season, if "tiering up" is practiced. By "tiering up" is meant tiering up the hives several stories high. To practice this, there must be plenty of hives and an abundance of empty combs or of comb foundation. When the lower story, or brood department, is filled with bees, brood and honey, and honey is being brought in quite freely, then an upper story filled with empty combs is placed upon the brood department. When these combs are filled with honey, and the bees begin sealing it, the usual course is to extract the honey, returning the combs to be re-filled. Such honey as this is not thoroughly ripened, and must be stored in open vessels to allow further evaporation. The vessels should be covered with muslin to exclude dust and insects. If the apiarist has plenty of empty combs and hives he can, instead of extracting the honey, simply raise the story of filled combs and place between it and the lower story another story filled with empty combs. When the last added combs are filled another story can be added next the brood nest. At the close of the honey harvest the combs of surplus can be removed and extracted. By this method there will be but little work to do during the busy season; and many bee-keepers think that honey thus thoroughly ripened by the bees has a more smooth, fine, rich, aromatic flavor than honey that is extracted while "green," and ripened artificially. Although frames of any depth can be "tiered up," shallow ones are much better adapted to the method. As the honey is not extracted until the harvest is over, robbers will be very troublesome, unless the proper precautions are taken. By a plentiful use of smoke nearly all the bees can be driven from the combs of the upper story, when it can be removed to a room with wire cloth over the windows. The wire cloth should extend several inches above the window on the outside, and should not touch the casing at this point, a space being allowed

between the wire and casement large enough for a bee to crawl through. The sashes must be removed. The bees will leave the combs, alight upon the wire cloth, and crawl out at the top. If it is not convenient to arrange a room as above, then a small tent made by covering a light wooden frame-work with mosquito netting can be set over a hive while the combs are taken out and the bees brushed off.

For a surplus receptacle in raising comb honey I know of nothing better for farmers than what is known as the Heddon case. It is simply a shallow box, without top or bottom. It is three-eighths of an inch deeper than the section boxes used, and as large as the top of the hive. There are partitions of thin boards inside the case. These partitions are such a distance apart that a row of sections just fills a space between them. To support the sections strips of tin are nailed to the lower edges of the partitions, and to the end pieces of the case, the edges of the tin projecting sufficiently (one-eighth of an inch) to afford a resting place for the sections. The case is filled with sections, the sections first being filled with comb foundations, and placed upon the hive. A plain, flat board, cleated at the ends to prevent warping, is used to cover the case. When the sections are two-thirds finished the case can be raised and another placed beneath it. When the lower case is partly finished, another can be placed beneath that. As soon as the top case is finished it can be removed. This manner of procedure may be continued as long as the honey harvest continues.

Movable comb hives are, of course, advisable, and in the production of extracted honey are indispensable, but box hives *can* be used in raising honey. If they were more shallow than usually made, it would be better. Bore the top of the hive full of holes, lay some thin strips (⅜ inch) around the outside edge of the top of the hive. On these strips set a Heddon case of sections, and proceed to "tier up" the cases as before described.

Genessee Co., Mich.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

AMERICAN FORESTRY CONGRESS.—Proceedings at its meeting held in Boston, September, 1885.—This association is doing much good. Its efforts are not fully appreciated by all, but the time will come when the value of its labor will be understood. As a nation we have always been wasteful of our trees. The early settlers hated trees and stumps. The great wood giants fought hard for the possession of the farm. Many of us have inherited this hatred or look upon the woods as boundless as the air, without limit, incapable of destruction. As it is well put in this volume, years ago America was a forest, but had no Congress; now she has a Congress but too little forest. People are rapidly increasing, but trees are decreasing still more rapidly. The Forestry Congress has done much to arouse public sentiment in favor of protecting forests, and has accomplished much in the way of promoting legislation favorable to that end. The present volume contains the addresses delivered at the meeting. They are filled with practical and sensible information. We hope to make copious extracts from them in the future. The facts and figures given to show the proportion of woodland, as compared with the total land area in this country, are startling. The percentage of forest to total area is 26.4. To build the existing miles of railroads in this country has required the available timber on 4,131,520 acres. To keep them in repair requires the product of 590,217 acres. Allowing 25 years as the time necessary for trees to attain a size suitable for making ties, it would require the annual growth of 14,755,425 acres to keep good the existing roads, and 8,300,000 to supply the demand for new roads. Thus we must hold in reserve 18,000,000 acres, simply to maintain the road-beds of our rail-roads. This area would be larger than the States of New Hampshire, Vermont, Massachusetts and Rhode Island combined. Americans may well feel uneasy over the wholesale destruction of forests.

THE "MUDGETT" TEDDER.—Circular from B. & J. W. Belcher, Chicopee Falls, Mass.—We spoke last week of the value of a good hay tedder. By the use of such an implement one horse and a boy can be made do the work of 20 men. A man or boy may slight work that is not closely watched, but a machine cannot do so, unless it is broken. The spring fork on the "Mudgett" tedder enables the machine to pass safely over stumpy or rocky ground. Farmers are urged to procure the "Mudgett" because of its strength, its close and uniform work and its lightness of draft. The good points of the machine are best discovered by a personal examination on the part of the purchaser, and the manufacturers earnestly request all intending purchasers to look the "Mudgett" carefully over and compare it with other makes before deciding which one to buy.

THOROUGHBRED STOCK.—Circular from G. H. Bell, Rome, N. Y.—Good specimens of thoroughbred Short-horn and Ayrshire cattle and Poland-China swine, are held for sale.

THYMO-CRESOL.—The Universal Purifier, The Cold Water Dip!—Circular from T. W. Lawford & Co., Baltimore, Md.—This material is highly praised by such men as Henry Stewart, Col. Curtis and Wilmer Atkinson. It has given universal satisfaction wherever it has been tried. It will mix easily with either cold or warm water, and forms a perfect sheep dip. It is not poisonous, and in small proportions it can safely be taken internally by any man or beast. As an agent in the cure of skin diseases in man and beast it has given good results, and as a disinfectant it is highly recommended. It will destroy all vermin on animals, and is frequently used in the poultry house. For horticultural purposes, to rid vegetation of lice and scale, it will be found useful.

What Others Say.

CULTIVATION OF CORN.—We can find no good reason for changing our belief, frequently expressed heretofore in these columns, that it is injurious to the corn crop to disturb the soil between the rows, after the plants are eight inches high, to a greater depth than three inches. Henry Stewart says, in the N. Y. Times, that some years ago it was claimed as a great discovery by Dr. Sturtevant, of Massachusetts, now Director of the New York State Experiment Station, that corn should be root-pruned by running the plow deeply between the rows about the time of tasseling, so as to break the roots and compel the plants to throw out new ones, by means of which the formation of ears could be largely aided and the crop much increased. This was hailed by some inexperienced persons as a most excellent idea, and it was commented upon favorably by them as a valuable hint to corn growers. It is quite possible that the Director had tried this plan on his own corn-fields in a wet season, and had based his theory and advice on this illusive experience. For it was not long before the grand mistake was acknowledged in a bulletin from the Experiment Station. But as truth travels very slowly, while error goes by leaps, the mischief is still being done and the deep cultivation of corn is still advocated. Now, for one very good and sufficient reason, at least, deep cultivation in any kind of soil is to be held as injurious to the corn crop. The excuse for it by those who advocate it under any circumstances is that in a wet season it is the only way to dry and warm the soil in such a manner as to provide for the necessities of this crop, which requires warmth. But we submit that this is neither the time nor the way to dry and warm the soil. This should be done previously, either by draining the land or by previous deep and thorough plowing, leaving it in a well fitted condition for the crop. We recognize the difficulties met with in working the adhesive, stiff, pasty soils in many localities in the corn-growing regions, but the fact that the deep working of such soils, when saturated with water, is exceedingly injurious to them, as well as to the crop, cannot be got rid of, and the way out of these difficulties is by drainage and not by breaking the soil deeply while the corn is growing. The R. N.-Y. has raised several of the largest crops of corn on record, and our plan of shallow and flat cultivation and surface manuring or fertilizing is everywhere gaining advocates.

CHEMISTRY OF HAY-MAKING.—Mr. Voelcker, speaking of the chemistry of hay-making, says that hay made on a fine day with the heat of the sun, loses practically nothing of its value. Hay cut in fine weather contains 70 per cent. of water—too much to induce fermentation. As the grass lies the cells of the plants begin to die and water passes off by the combination of the heat of the sun and a drying wind—so does the balance of water and sugar and fermentable matter in the grass alter. A point is reached which is most favorable to fermentation. At this point the grass remains nice and green, and gets the sweet aroma characteristic of well-made hay. If the weather still continues fine, the water passes away until there is not enough left to induce fermentation. In rainy or damp weather we do not get these conditions. When the grass reaches that point where fermentation is most favorable, the dampness keeps this point up and fermentation goes on. If rain comes we not only lose from fermentation, but also in consequence of washing by excessive water. It is found that the class of manures used has a great effect upon the leaves and stems of grasses. Nitrogenous manures tend to produce an increase of leaf, and mineral manures an increase of stem.

PLANK STABLE FLOORS.—A writer in the same excellent journal says that hemlock and spruce are among the best materials for stable floors. But a plank floor is an absorbent of the urine, and soon becomes rank with ammoniacal odors. Then some process is required to make the planks waterproof. This may be done by saturating them with hot gas tar, when the floor becomes a most desirable one for such stables as cannot have a ground floor. For a plank floor of the best kind the writer would lay the timber double; that is, first a floor of three-inch plank of some soft kind, and thoroughly soak this with boiling hot gas tar, filling the joints well. Then, while the tar is still hot and soft, a two-inch plank floor is laid, breaking joints, and pressing the planks close, so that the tar fills the joints of the upper floor, and overflows upon the upper surface, which is finally well coated with the tar. This floor is made to slope to the rear one inch in the yard, or 2½ inches in the 7½ feet of the standing floor, which is all that is double. This short double floor gives a dry bed for the horses, and the drainage all flows off from it to the lower floor, where it may be collected by a liberal coating of dry absorbents. The tar coating is apt to make a slippery surface, but this may be avoided by dusting dry sand upon the tar until no more will be taken up.

THE CAUSE OF ROPY MILK.—There is something wrong in the feed. Just what it is cannot be told without a full inquiry into the case, says L. B. Arnold in the N. E. Homestead. There are several things that produce ropy milk and cream. The most common cause is the use of some medicinal weeds, especially bitter weeds, as rag weed, tansy, wormwood and some species of yellow daisy. Poisonous weeds, such as cicuta, and lobelia, which cows sometimes seem disposed to take, have the same effect. He has, in several instances, known it to occur from an excessive use of good food. A too free use of corn meal and of sugar beets has every now and then been the occasion of ropy milk, but oftener in hot weather than in cold. It is also often the result of weakness from any cause, but especially from scouring. As the cow in question is apparently well and giving milk, the cause undoubtedly lies somewhere in her feed, and if the owner will take the trouble to change one condition of her feed at a time he will be able to find the cause, and will gain for himself a bit of valuable information.

CLOVER AND HOGS.—John Tucker says, in the Farm Journal, that it does him good to hear people talk about clover and hogs. There is no way a farmer can improve a field faster than by seeding it down and pasturing hogs in it—unless it is to sow peas in a lot and then let the hogs eat them on the ground. A pint of corn fed to a hog every day in a clover pasture will make it fit for killing before cold weather. Two quarts of middlings a day wet up and fed to a hog, wintered over, in connection with good pasture, will make it ready for the market in Autumn. In this cheap way the hogs may be fitted for market early, and the land fitted for a good crop of corn the next year. The shut-up system of making pork is mighty poor economy. The hogs will do a great deal for us if we only give them a chance.

TRUE INWARDNESS.

CUT the clover before the blossoms begin to fade .....

THE Farm Journal says that the animals must drink in hot weather and must take what they can get. But they hate nasty water as much as we do.....

THE Striped Melon Bug, according to Fred. Grundy in the Weekly Press, may be driven away and kept away by sprinkling the plants with water with which a liberal quantity of fresh cow manure has been stirred. Use a whisk broom or something of the kind and don't be afraid of applying too much. Repeat after every shower.....

YES, we should suppose that the green foliage and stems of cow peas would be among the best plants for the silo. In our tests with the different kinds of cow peas eight years ago, some varieties spread as far as 12 feet, growing in hight from one to two two feet. We also found, as others have since found, that some kinds of cow peas ripen, their seeds and have time to spare.....

THE staple food for chicks, Henry Stewart says, is cracked wheat and corn. A coffee mill will serve to crack them. Earth-worms are a great treat to chickens. In place of the worms some lean meat may be chopped fine; give a tablespoonful to a brood of 10 or 12 each day. Give them pure water. The gapes which destroys so many chickens may be avoided by keeping the chicks on clean ground and in clean houses.....

A LITTLE food scattered under a plum tree which is jarred immediately after (in the early morning) will attract the chicks, which will devour every curculio that drops.....

A WIRTER in the London Ag. Gazette speaks highly of pure Langshans. He says it is well known that Langshans lay more eggs than either Cochins or Dorkings. He gives the number of eggs for each hen as 173 per year. The hens should be fed only sound whole grain. He says they lay all through the Winter.....

THE same Journal says that even butter-makers must admit that butterine is a legitimate article of manufacture, and only requires to be sold under its proper name to prove a great boon to the poorer classes, who may not be able to purchase real butter. It is the universal experience that good butterine is infinitely superior to many samples of fresh butter to be found in the English markets....

HON. T. C. JONES, writing to the London Live Stock Journal, says that there is no doubt that British as well as American breeders of Short-horn cattle have been making too much of pedigree—that by combination among owners of fancy sorts, values have been advanced to such prices that breeders have been obliged to reserve every animal of the approved lines of breeding, however inferior, for use in the breeding herd. The consequence has been in too many instances a marked and obvious decline in useful qualities.....

THE horse show to be held in Chicago, Sept. 6, is to be a great affair .....

MR. SHARPE says, in Nature, that it is not merely a sentimental grievance that is uttered by the bird defenders—although it would be greatly to be regretted if all our bright plumaged birds were destroyed—but one that affects the welfare of the nation at large. A very considerable proportion of the birds killed are essentially beneficial to man, and should, from mere economical considerations, be protected.....

IT is an axiom in political economy that the demand creates the supply. As long as women will ask for feathers and birds, so long will they be destroyed, for the collector would willingly kill the last of its race if he could get 15 cents by selling the skin. In social morality we regard the tempter and the receiver as worse than the thief. In our criminal courts of justice he is always, when convicted, punished more severely than the culprit, whose ill-gotten goods he buys. It is useless for a lady purchasing the corpse of a Bird of Paradise to endeavor to ease her conscience by saying, "I did not kill it; and if I did not buy it some one else would." It was slain with ten thousand others to gratify her desire to wear dead birds, and she is more guilty than the man who shot it, for he killed it to gain a subsistence and she instigated the killing for mere caprice.....

THE better the workman the better the work, and the better treatment he should have, says the N. Y. Times. To some degree the entrance of a hired man into a farmer's family is to be viewed with suspicion if not alarm, as a threatened danger, and on the other hand the workman is sometimes degraded by the treatment received. .....

FOREIGN immigrants and tramps now take the place of young men who could be introduced to the family without objection .....

A WRITER in the Albany Cultivator says that he has fed for three seasons his entire herd in milk on green rye, and the improvement in quality of milk, cream and butter is marked. Green rye makes butter gilt-edged. He uses no coloring for butter.....

"'I am going to the seaside,' said the milkman blithe and gay;
'For I love the ocean breezes, and love the dashing spray,
Yes, I love the glorious sunset, love the calm and love the squall—
But I think I love the *water*, in my business, best of all.'" —*Tid-Bits.*

A WRITER in the Cultivator (Albany) says that he has owned a creamery and bought milk in various quantities for the last eight years. In that time, he has used successively the Cooley system, Swartz system of deep open cans in ice water, the Marquis system of 1,200-quart vats (milk being cooled by a current of ice water flowing through four inch pipes, running through the vats), and lastly, for the past two years, the Laval separator. The last he believes the best. It is simple, easy to run, does not get out of order, separates the milk as soon as brought to the creamery, makes more butter per hundred weight of milk, and by the market standard of price, gives as good a return, if not better than any other system.....

PROF. TUSON, in a lecture on disinfection,

says that the desideratum is a substance that will throw off sulphurous acid on exposure to the air, while remaining unchanged in confinement. Chloride of lime sets free its active agent in this way, but though a deodorizer, it is not an anti eptic.....

A DISINFECTANT destroys the organic germs; a deodorizer destroys or neutralizes offensive odors, and an antiseptic prevents or retards putrefaction. It is said that sulphurous acid will combine all these properties in the best form. A mixture was formed of sulphate of lime, sulphate of zinc and sulphate of alumina. Moisture or air caused a decomposition between the sulphates of lime and alumina, which resulted in an evolution of sulphurous acid gas. This has given the most remarkable results in neutralizing foul odors.....

THE best Scotch married shepherds receive as yearly wages about $125 in money, 500 pounds of oat meal, potatoes, a cow's keep and a free house and garden. In many localities the "pack" system of paying wages still exists. Under this system the shepherd is permitted to raise a small flock of sheep of his own and find his wages in the profits derived from his sheep. These small flocks are generally about eight per cent. of those herded for the owner of the estate.....

A. W. CHEEVER would be perfectly willing to dispense with the crow and the English sparrow, as he thinks both birds do more harm than good. A crow can be tamed as easily as a chicken, and quickly makes himself at home about the yard. He will not touch the potato beetle as some persons have claimed. He is a great robber of birds' nests, and is as unfeeling as a butcher .....

A WRITER in the New England Homestead well says there are millions of dollars' worth of good fertilizers lying dormant under barn floors. Where there is no basement, it will pay to take up the floor of the stable and dig up the soil and fill in with fresh earth.....

THE Homestead makes sport of the common practice of shouting at oxen. There is no reason for this tremendous outburst of noise which is hurled at oxen ordinarily. Cattle can be trained to mind a quiet and determined voice without this shouting.....

PROF. ATWATER says that in a pint of milk and a pint of oysters there is the same amount of nutriment. The oysters contain more nitrogenous matter—the milk more fat.....

SIR. J. B. LAWES says that the pig is the best and cheapest fat-making machine which exists, and that the human stomach has a great requirement for some sort of fat.....

THE N. Y. Times says that hundreds of millions of bushels of corn are sold in the ear at the rate of 70 pounds to the bushel. This will do for some kinds of corn. But the ears of many varieties do not weigh 14 pounds—some less than 10. Potatoes vary in weight from 40 to 60 pounds, and a dozen eggs weigh from 14 to 30 ounces. Yet all are sold for the same price .....

THE National Live Stock Journal is right in saying that the questions, what is the cost of a bushel of wheat, a pound of butter or of beef, is about like asking what is the length of a string or the size of a piece of chalk. The cost depends upon the circumstances. It may cost a certain farmer so much to produce a certain amount of produce, another farmer on a different soil, with different stock, different tools and methods, cannot use these figures with any success. The only way to find out what produce costs, is for each farmer to figure on his own work and not accept the figures of others. The closer farmers follow this rule, the nearer they will come to success.....

THE Pacific Rural Press says that California grape growers have found that in smoking for frost, as in sulphuring for mildew it pays to get in the remedy ahead of the disease. On frosty nights bonfires of any material that will make a dense, heavy clinging smoke are made 30 to 40 feet apart throughout the vineyards. It was thought at first that it was only necessary to build these fires just before the sun came up. Now they are kept burning all night .....

IT appears to be pretty generally decided that the most economical use for liquid manure is to mix it with the solids and apply the two together. It will hardly pay to collect and cart out the liquids by themselves and for most plants they are too strong. They can be best conducted into a pit where the solids are thrown, or poured over the piles...

SPEAKING of Herefords, a writer in the London Live Stock Journal says that the disproportion in size between oxen and the dams they come from is one of the curiosities of breeding.....

DR. OGLE thinks that a white nose in cattle or horses indicates imperfect smelling power. He would suppose that white-nosed animals would be most likely to eat noxious or poisonous plants. Who have noticed that this is true?..... ....

THE Mark Lane Express states that arsenical sheep dips have been in extended use in England, but complaint is made that the rains wash the arsenic out of the wool to drip into the feed, frequently poisoning the sheep. A dip prepared from carbolic acid is well spoken of.....

OUR young associate of other days, C. S. Plumb, writing to our esteemed contemporary, the Drawing-room Companion, says that at Geneva (N. Y.), Lucerne or Alfalfa produces an abundance of foliage. It is hardy and a lover of dry, warm soil. He finds, however, that it makes an abundant and vigorous growth where the soil is cold and the thermometer drops to 15° below zero. His plots begin a vigorous growth as early as April 20th, and on July 2d the first cutting is made. One plot yielded at the rate of 10 tons per acre of green fodder; another over seven. On July 17th the plots were again cut and yielded at the rate of over six tons per acre. On Sept. 3d a third crop of over three tons was cut . ...

THESE plots of Alfalfa have made a good growth for three successive years. The foliage is clover-like, and all animals relish it. The average hight of the plants just before making the first cutting was two feet four inches. The plots were not manured. The roots descended quite vertically into the soil, and sometimes measured, a foot below the surface, three-eighths of an inch in diameter, and at two feet nearly one-fourth of an inch. Fibrous roots, though not abundant, penetrated to a depth of four feet below the crown. One large tap-root was traced three feet 10 inches below the surface. In sandy soil they have been traced to a depth of 13 feet. No wonder it thrives in dry soils.....

THE plants, as we know from a trial of Alfalfa at the Rural Farm, do not grow to a cutting size the first year. The land must be prepared as for clover, and 20 pounds of seed sown to the acre..... ....

Everywhere.

TRANSCONTINENTAL LETTERS.—LIII.

MARY WAGER-FISHER.

Sights at a fair; "second" fruit crops; nuts; jellies; apples; potatoes; onions; cabbages; grasses; wheat; origin of Golden Grain; farm wages; patronizing home industries.

THE Mechanics' Fair was in progress while we were in Portland, and we visited it on three different occasions as we found leisure so to do. The pavilion in which this fair is annually held is a permanent structure, and when decorated, as upon this occasion, presents a brilliant interior. Outside of the agricultural department I found little of interest to one like myself, who is tolerably familiar with the "stock in trade" of most fairs. There were more "crazy" quilts than I had ever before seen together, and considerable decorative work, of which the prettiest was a screen of satin or plush, on which was painted a part of a datura plant in bloom, the flower being very fine in effect. A young man who, with his brother, had invented a pillow sham holder—a metal fixture to be fastened to the head-board of a bedstead for holding up shams and lifting them out of harm's way at night—seemed to be having quite a patronage among women. I asked him how it happened that he had busied himself to invent such an article so distinctively belonging to the house, and he said he wanted to make some money. I thought if he had been a chamber-maid and had seen the shams tumble down after he had arranged them scores of times, he might have had reason to hunt for some mechanical remedy. Is it not a little curious that women so rarely invent practical labor-saving machines that apply directly to their own work? In the dairy department I noticed a "separator" for milk, that was labeled "sold."

In the agricultural department I found many novelties in the way of fruits and grains, and a good degree of taste manifested in the arrangement of grains on the stalk—a lesson learned, probably, at the Kansas Exhibit at the Centennial. There was quite a display of "second crops"—Wilson's Albany Strawberries, the second crop picked Oct. 12: the first April 25. This second crop of strawberries is not phenomenal in Oregon or Washington Territory, and this exhibitor, I was told, had brought in 40 boxes, which he sold for 40 cents the box. His ranch was near Mt. Tabor. There was a second crop of "June" apples, and a similar exhibit of silver prunes. Of a second crop of Bartlett Pears, I measured one which was 11 inches in circumference the long way and nine inches around—a goodly crop indeed. There were a number of strawberry plants in bloom and bearing green and ripe fruit—a sight to be seen in many a garden until Christmas. A laudable attempt had been made to show a second crop of cherries, but as the exhibit was limited to one cherry, it could hardly be called a crop! There were grapes from Walla Walla that had been raised without irrigation, and some very large, compact bunches that came from Jacksonville. Of grapes grown in the open air near Portland, I noticed Black Hamburg, White Tokay, Muscat Hamburg, Black Spanish, Iona, Royal Muscatine, Chasselas, Rose and Eumelan. Of nuts, there were black and English walnuts, chestnuts, hickory-nuts and filberts. But the display was meager—a few nuts in glasses—and from what I could learn, I am not inclined to correct the statement I have hitherto made concerning nut-growing on this northwest coast. The nuts, even when they can be produced, do not mature well.

A lady exhibited what she called Mesple—a German fruit, which was unfit for use until it decayed! Then, she averred, it made a fine jelly. Some of the jellies exhibited were fanciful in appearance—a section of orange jelly surmounted with currant, or a sandwich of the contrasting color, through the middle. There was a magnificent display of apples, one man exhibiting 98 varieties. I think the finest collection was made by the Porter family—superb apples without flaw. Early Rose potatoes, a foot long, were common; and I noticed one potato labeled as weighing 6½ pounds. There were some very fine-looking sweet potatoes from Eastern Oregon, and if they can be well produced there, they would form a profitable product, as the price is invariably high. The onions were exceedingly fine. I measured one of average size, 15 inches in circumference, and they produce from 1,000 to 1,200 bushels to the acre. There was an exhibit of onions grown on sage brush land in Idaho. The weight of one of these onions was two pounds ten ounces. A Peruvian pumpkin weighed 128½ pounds. Chinese squashes were brilliant in color. The cauliflowers were extraordinary—compact and firm—the circumference of one head was five feet and nine inches. Cabbages from 18 to 20 inches in diameter; but a Pacific Coast cabbage head would at any time be respected in the East for its size and quality. There were fine apples and squashes of a new shape, and a curious-looking fruit that was evidently undecided whether to be a pear or an apple, but which was called the former.

I saw stalks of oats eight feet high, and the stalk three-fourths of an inch around; Timothy eight feet and three inches tall; clover from the Waldo Hills, east of Salem, seven feet two inches. The Timothy man harvested 12 tons off four acres. One Timothy head was 18 inches long. There was a fine exhibit of wheat, both as to quality and variety, and it was well endowed with fanciful name—"English Purple Velvet," of which one farmer in Linn County harvested 96 bushels from three acres. "Palestine Mammoth Wheat"—largest wheat known. The exhibitor told me that he had sent 30 bushels of it to a Philadelphia firm, which changed the name to "Golden Grain." Its yield was 30 bushels to the acre. Black African Wheat, with beards like porcupine quills, was black of head and yellow of stalk—a novelty. Russian rye, with grain three-fourths of an inch long, yielded 35 bushels to the acre. A fine specimen of Japanese bamboo, grown in Portland, promised a probable future for that plant on this coast. White Australian Spring Wheat and the Winter Velvet were mentioned as good varieties for Oregon, and yielding from 20 to 60 bushels to the acre, according to condition. There was a general complaint of lack of markets for products, which was urged as partial explanation of wasteful, shiftless farming so prevalent in Oregon; but every one seemed agreed that a better class of farmers were coming in from "the States"—as old Oregonians still speak of the the rest of the country.

I asked the wages paid to farm laborers—an average wage, with board the year around, $15 per month; for the Summer, $1.50 per day. A stock show—the first held in Oregon—was also in progress, but I quite forgot about it until it was too late. Its great attraction was the "largest steer in the United States," owned by Mr. Johnson, of Portland. It weighed 700 pounds more than the prize steer at the last Chicago stock show, and bore the pretty Indian name of Multnomah. On every side we heard much talk of protecting home industries by patronizing them, and it would seem to be the only successful way to do, for with Eastern manufacturers flooding this coast with their wares, there is small chance for local industries. There is iron enough here for all purposes, but nine-tenths of all stoves come from the East. It is the old story—tribute to the East. Oregon has some good woolen manufactures, and some of the cloths made are fine enough in appearance for any gentleman's wear; but the men, as a rule, buy English cloths, sending their money to Great Britain, and then growl about the Chinese sending their money to China! Quite an amusing incident occurred at the fair, produced by a lady asking if certain stoves were made in Portland, and upon being told that they came from Chicago, she remarked with a patriotic toss of her head, that she believed in patronizing home industries. The man who had answered her question replied with spirit: "So do I, madam, and I wish every lady in Oregon wore linsey made on that loom there!" The lady wore a gown of silk that was made in France, a shawl that was woven in India, the feathers on her bonnet came from South Africa, her shoes from the East and her gloves probably from Paris. But she had a sense of "justice," nevertheless, much as we all have, and exemplified it in about the same fashion—one kind of preach and another kind of practice.

RURAL SPECIAL REPORTS.

Illinois.

KIRKLAND, De Kalb Co.—Small grains look well here. H. M.

Indiana.

PENDLETON, Madison Co., June 6.—Wheat still gives promise of an average crop. Corn planting is about over. Corn planting and wheat harvest never before came so close together. Some wheat fields have a tinge of gold, as if they would be ready for the sickle in 10 days. Drought is prevailing to such an extent that fields as well as roads are dusty. Gardens, late planted corn and berries are suffering for rain. S. W. H.

Maryland.

WESTOVER, Somerset Co., June 7.—Though we had an unusual amount of rainfall the past Spring, the season is the earliest we have had since 1880. The pea and strawberry crops are all marketed, and although there have been no fancy prices, fair prices have ruled the season through. The crops have been abundant, and most growers have realized a handsome profit. The hay crop will be the best in several years. Wheat and oats are looking well, oats heading out, and wheat will soon be ready for the reaper and binder. Corn is making a slow growth on account of the very cool nights, and much re-planting has to be done because the birds have pulled it up—principally black-birds. All kinds of stock are in a thriving condition. Musk melons in bloom. Tomatoes as large as a hulled walnut. I pulled to-day from the "Alaska" Pea 10 pods weighing two ounces. S. C. S.

Missouri.

ELDON, Miller Co., June 1.—Farmers certainly cannot complain of the prospects for crops this year, for taking things all around, it would be difficult to have them average better. Wheat, oats and grass will all make full average crops. This is well-nigh assured. Pastures are in first-class condition. Fruits in full supply, except peaches. Corn all up and growing finely. Ground clean and weather favorable. N. J. S.

Montana.

FRIDLEY, Gallatin Co.—I have a farm here of 700 acres, Yellowstone Valley land, and a great portion of it is nice enough and good enough for garden, and from a three years' experience, I am satisfied almost any kind of fruit or vegetable grown in N. Y. State can be grown here. Last year and the year before last, no frost from May 1 till September 10.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

THE STRAWBERRY LEAF-ROLLER.

D. H. L., Sheboygan, Wis.—For two years an insect somewhat like the cut-worm, but only half its size, and of not so bright a green, has infested my strawberry beds. It appears about the time the fruit begins to ripen, and in a short time nothing is left but ribs of the leaves and the stems. What is the name of the pest, and a remedy for it?

ANSWERED BY PROF. A. J. COOK.

It is the worst enemy of the strawberry, and has done serious damage in Michigan as well as in Wisconsin, Illinois, Indiana, Ohio, etc. It is the Strawberry Leaf-roller—Phoxopteris fragariae (W. & R.) The moth is quite small, expanding not more than 9-16 of an inch. The front wings are brown striped and specked with black and white. The body and hind

wings are dusky. There are two broods. The moths are flying in early Spring and in July. The caterpillars are small, about one-half inch long when full-grown. Like all larvæ of the Tortricids, or Leaf-rollers, they have 16 legs. They vary much in color, from brown or yellow to green. They will be seen feeding in May and June, and again the second brood in July and August.

As we find true of almost all Leaf-rollers, these larvæ roll up the leaves as they feed. These leaf cylinders are held by threads of silk. Thus the insects live in a green house, which serves them not only for food but for shelter as well. This feeding upon the leaf causes it to turn brown and to wither. The insect pupates within the rolled leaf, where the chrysalis may be found in late June or at the close of the harvest. Saunders advises the use of hellebore to kill the pests, but I have not found it effective. Neither has pyrethrum served the purpose. The larva is so well protected that it is difficult to reach it, as we must to make buhach a sure remedy. Paris-green dusted on to the leaves in May will kill the insects: but, of course, it can not be used on beds where the berries are soon to be used. When beds are in bearing, so that we can not use Paris-green, we can fight only the second brood. There are two ways which I have tried with marked success. First, sprinkle a light coating of straw over the beds as soon as the berries are picked, and set fire to it. This destroys the insects, now in the larval or chrysalis state, and as the vines seem little injured, we seem to have solved the difficulty. The other remedy is the use of London-purple just as the second brood commences to work—late in July in Michigan and Wisconsin. As the insects are so snugly rolled up, the poison does not get where all can or will eat it, and so, on the whole, the burning has given the best satisfaction. As a small parasite is destroying these insects in great numbers, it may be well not to burn over the beds, except where the insects are very troublesome.

SWEENY.

Subscriber, Blue Hall, Fairmount, W. Va.—What will cure sweeny caused by a sprain a month ago?

ANSWERED BY F. L. KILBORNE.

If there is still any heat, swelling or tenderness over the shoulder, keep the animal quiet, and bind a wet blanket over the seat of injury until relieved. When these symptoms have disappeared, allow daily walking exercise on level ground or road. Rub the wasting muscles briskly for 15 or 20 minutes each night and morning with a hard-twisted wisp of hay or straw; or apply a mild blister of equal parts of strong ammonia and sweet oil, to be repeated as soon as the effect of one application has disappeared. Several weeks will probably be necessary to effect a complete recovery, but this simple treatment should be sufficient for so recent a case. The animal should not be worked on miry or uneven ground or be put to the plow for more than a year after recovery, as by so doing the animal will be very liable to be sweenied again.

THE VETCH.

J. J. S., Columbus, Ga.—The "pea" sent us is the common vetch or tare. It is much cultivated in Europe and latterly in many parts of the South. In good soils it grows two or three feet high. The stems are tender and soft and cattle love it. It is an annual, flowering in May in Georgia, the seeds ripening in the course of the Summer. Then the plant dies. Toward Autumn the seed germinates and the young plants grow slowly all Winter, running up rapidly in early Spring. It may be cultivated profitably in the South as an early spring forage plant, and also be cured as hay for winter use. Later in the season the cow-pea is the favorite. The botanical name of this vetch is Vicia sativa.

GREEN LICE ON APPLE AND PLUM TREES.

A. S., Beechwood.—Green lice on apple and plum trees seek the twigs and tender shoots, suck their juices and thus live. The remedy is to spray them with tobacco tea, or to dip the infested twigs into the tea. We have tried nearly everything to kill these pests, and find that when trees or large bushes are attacked the best way is to "grin and bear it." In the case of rose bushes and smaller plants, we spray them, as stated, with tobacco tea or with pyrethrum powder and water, or blow the powder upon them. Paris-green does not kill them since they suck the juices. When the tips of the twigs are alone infested, it is well to pinch them off or destroy them. The black ants you mention as attending the lice merely squeeze the latter, which thereupon yield up a liquid which the ants relish.

DEATH TO THE CURRANT WORM.

J. W., Sand Lake, N. Y.—There are several ways of killing the currant worm. The best is to use powdered white hellebore. Put two tablespoonfuls in a pint of hot water. Mix and add this to two gallons of water. Spray the bushes with this. It is an absolute specific. A spraying bellows (Woodason's for sale by seedsmen), a hand force pump with cyclone nozzle, or, finally, a watering (flower) pot. Buhach or pyrethrum powder, used in the same way, answers very well.

Miscellaneous.

S. C., Davenport, Washington Ter.—1. What is the best way to root cuttings which are difficult to root? 2. How can onions be kept over Winter? 3. Will Tall Oat Grass endure drought and summer frosts?

ANS.—1. By layering, *i. e.*, bending down a branch and burying a part of it. 2. Spread the onions 12 to 18 inches deep on a tight floor or loft in a dry barn or shed. Cover them with a foot or more of straw or hay, and don't disturb them till Spring. They will be injured if allowed to freeze and thaw alternately; but not if after freezing once, they are kept from thawing until wanted. 3. Tall Oat Grass stands summer heat well in Alabama, and is prized in New England. Of late years good accounts of it come from Michigan. Prof. Shelton regards it favorably for Kansas; Mr. Wysor objects to it for Virginia as not as good as Timothy, as a great impoverisher of the soil, as not relished by cattle if they can get Timothy and clover. But to answer our friend, it would seem that this grass has great power of endurance.

"Subscriber" Home, Tenn.—A large gobbler began losing feathers from his breast last December, and has continued to do so ever since. The exposed flesh is puffy, soft and red; otherwise he is in good health and thrifty. What's the matter?

ANS.—If the turkey has never moulted, being in his second year, there may be several causes for the trouble. First, the turkey hens or barnyard hens may pick off the feathers. Second, it may be caused by the roosts, as he may have some peculiarity in roosting, thereby rubbing off the new feathers as fast as they appear. Third, it may be due to a parasitic disease. We would suggest anointing the parts, once or twice a week, with a mixture of 10 drops of carbolic acid in a tablespoonful of glycerine.

J. B. F., Smyona, Del.—Gooseberries planted in the Fall of 1882, are heaved up every Winter, until now many plants have only a bare hold in the ground. I am thinking of running a peach tree cutter under them next Fall and resetting; would I lose next year's fruit crop by so doing?

ANS.—We are afraid we do not understand the question. Any injury to the stems or necks of gooseberries would injure the roots, in which case they would not descend deeply into the soil, and might be thrown out by the alternations of frosts and thaws of Winter and Spring. The best thing to do is to cut them back in the Fall to within three inches of the soil, and cover them with a mulch of straw or manure. You will lose next year's crop.

G. M. W., Johnstown, Pa.—Last Summer I planted a lot of potted strawberry plants which throve well till they had attained a fine growth, when the leaves began to wither and shrivel. Examination of plants and roots could detect no insect enemy. Now they are in bloom and many have large berries, but here and there they are suffering as they did last year. What is the matter?

ANS.—We have never had a similar experience, and can not give our friend any information. Perhaps some of our readers can answer the question.

T. M. V., Steuben Co., N. Y.—A breed of cattle, "good milkers and fair for beef, to be used in supplying milk to a factory, principally for cheese," will be found in Holstein-Friesians. For all practical purposes three-quarter grades will do as well as thoroughbreds. Cows from a good Holstein bull out of grade Short-horns would come as near to the animals you require as any we can think of. Hereford cows are not suited for the dairy. They have been bred for beef and for early maturity, and even their champions claim nothing for them as dairy animals.

R. W. H., Jasper Steuben Co., N. Y.—1. Is the Manshury Barley better for feeding purposes than the common six-rowed kind? 2. Does it yield more?

ANS.—1. Yes, it is a plumper, heavier barley and weighs more per bushel, and, of course, it has more flour in proportion to the hull. 2. Yes, nearly one-half more; two years ago we harvested 517 bushels from seven acres. Anyone is foolish to try to raise common barley when he can get this.

T. F. B., Wolf's Store, Pa.—Your chickens are troubled with roup. Change the feed and give cooked feed, vegetables, green food and rice. Dissolve a dram of chlorate of potash in each pint of drinking water. Bathe the heads in water slightly tinctured with vinegar. Put a little cayenne pepper into the feed. Remove the sick fowls from the flock, and put them in a dry, sunny place.

Subscriber (address mislaid).—Will corn-fodder keep (if cut, sweated and salted, or air-slake limed and put in a mow) like clover hay?

ANS.—We do not know that the plan has ever been tried. We do not see how this system would give any advantage over results now obtained with the silo.

C. R., Battle River, Dak.—The few kernels of grain sent resemble the Diamond or Polish Wheat. It is known by many other names. It is a spring kind and bearded, with wide, peculiar chaff.

E. Moore, Jefferson Co.—We know nothing of the "Earhart cap raspberry." Plants are growing in the Rural Grounds and we hope to report upon them in due time.

DISCUSSION.

T. H. H., NEWPORT, VT.—In answer to an inquiry, a late RURAL says:—

Hen manure and ashes, bones, etc., as fertilizers cannot be compared since hen and barn-yard manure are *comp ete* manures, furnishing all needed kinds of plant food. Ashes and bones are not complete. To get the equivalent of hen manure, raw bone flour and ashes with the addition of more nitrogen than the bones contain should be used.

Does not the RURAL, in the above quoted remarks, confound a complete manure with a well balanced manure? Ashes with raw bones are complete, *i. e.*, they contain phosphoric acid, potash and combined nigrogen. They do not constitute a well balanced fertilizer: but no more is barn manure, and still less is hen manure. This subject of well balanced fertilizers has not been sufficiently pressed upon the farming public. A badly balanced manure is used at a loss, often a large one, and farmers should be made to understand fully this important point in farm economy. Nearly all animal manures have an excess of nitrogen—often a large excess, and phosphoric acid in some form should be almost invariably used with them. To understand this, and to know how to make any manure, whether complete or incomplete, closely adapted to a particular soil or crop, are very nice, and very important points of husbandry.

R. N.-Y.—The question was as to the comparative value of hen manure, ashes, bones, etc., separately, not as to the value or results of a mixture of any two or more. This would have been more plainly indicated, if instead of "ashes and bones are not complete," we had said, "Neither ashes nor bones," ect. The other points which Dr. Hoskins makes should be studied by every farmer. Hen manure or farm manure of any kind fails to have the same effect on different soils, for the reason that some soils need more or less of the food constituents which are lacking or abundant in those soils. To feed the soil just what it needs is the great economical problem.

C. E. P., QUEENS, N. Y.—In the RURAL for May 29th, "Workman" advises us to clean out the refuse of the hay, straw, etc., that can be found in the lofts and on the barn floor, and to place it on the manure pile. Such a cleaning would be found to be a very profitable job for a rainy day; but I certainly would not advise anyone to place such refuse on a manure pile unless it is his intention to fill his fields with a great many troublesome weeds. Such refuse will, if closely examined, be found to contain seeds of many of our most troublesome weeds, such as daisies, snapdragon, wild onions, etc, and to place them on a manure pile where they will retain their vitality and be distributed among the crops is certainly, to say the least, a very foolish piece of work. All such refuse should be burned if possible, or else buried very deep, and it will be well to destroy all vegetation that might spring up around the place for some time afterwards. Most farmers are very careless in this respect, and are forever complaining of the constant increase of weeds on their farms, when in very many cases they have no one to blame but themselves, and the exercise of a little care and forthought on their part, would certainly prove to be very profitable to them in this respect at least.

C. M., ONONDAGA CO., N. Y.—A late F. C, spoke of the reason why the leaves of some pear trees turned black. I attribute it to high winds. The leaves were tender owing to their fast growth. Here we had a like experience. When the leaves had spread fully, a high gale lasted 24 hours, and all tender growth showed the effects of the severe whipping. Raspberry bushes were torn, as the leaves were badly beaten against the briars, and the maple trees looked as if the army worm had stripped them.

SUMMER DRESS GOODS.

JAMES McCREERY & CO.

Call attention to their very complete stock of Summer Dress Goods, and the following special lines:

40-inch French Foule, all colors, 45c. per yard. A large variety of plain and figured Albatross at 50c. per yard. 48-inch Diagonal Serge at 75c. per yard. 42-inch striped and plain Camelette Suitings at 75c. per yard.

The above goods are all wool, and are remarkable value for the prices named.

ORDERS BY MAIL

from any part of the country will receive careful and prompt attention.

JAMES McCREERY & CO.

Broadway and 11th St., New York.

THE ROAD and the ROADSIDE.

BY BURTON WILLIS POTTER.

Showing the Principles of Road-Building & Repairs, and of the Law Appertaining to Public and Private Ways, etc.

One volume 12mo, cloth. Sent, post-paid, on receipt of

ONE DOLLAR.

The book is a comprehensive treatise on such matters relating to the common roads of the country as are of interest to every traveler and every owner of land bordering upon them.

CONTENTS—History, Importance and Significance of Roads. Location. Construction. Repairs. Law relating to the Laying out of Ways. Law as to Repairs. Guide Posts. Drinking-Troughs and Fountains. Shade-Trees, Parks, and Commons. Public Use of Highways. "The Law of the Road." Equestrians and Pedestrians. Omnibuses. Stages and Horse-Cars. Purposes for which Highways may be Used. Use of Highways by Adjoining Owners. Private Ways. Don't. Foot-paths. Within and Without the Roadside. Enjoyment of the Road.

Little, Brown & Co.,
PUBLISHERS,

REED AND BARTON

(Established 1824,)

MANUFACTURERS OF

Silver-Plated Table Ware

Of every Description,

Would call especial attention to their Patent

CHINA-LINED

ICE PITCHERS.

The Linings of our Pitchers are held in position by the Cover, which is secured by thumb-screws and is easily removed and replaced, thus facilitating the cleansing of both pitcher and lining. The lining is of the finest Stone China, and has no equal for preserving ice and keeping water pure.

SALESROOMS:

37 UNION SQUARE,

NEW YORK.

WANTED By the Chase Nurseries, Honest and Energetic Men *to solicit orders for their Nursery Stock.* The business easily learned. Full instructions given. **Permanent Employment and Good Pay.** State age and previous occupation. Name this paper. New England applicants address us at Boston; York State and West, at Geneva, N. Y., Penn., N. J., and South, at Phila. State age. **R. G. CHASE & CO.**

THE
RURAL NEW-YORKER.
National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JUNE 19, 1886.

NOW, RURAL readers, let us again press it upon you to save seeds of your best strawberries, and sow them *at once* in fine, rich, mellow beds. If you would have the greatest variety of seedlings, sow the seeds of pistillates that grow among different perfect-flowering kinds. Select berries that are shapely and of good quality. A good way to gather the seeds is to mash the berries between thick pieces of paper and let the pulps dry.

THE value to the farmer of many of the reports of our experiment stations is seriously injured by the confused manner in which the results are presented. The teachings of a given experiment are often so much mixed in with the details of it, that they become clear only after considerable study. We can easily imagine an intelligent farmer who is really seeking after knowledge, giving up in bewilderment and despair his attempt to digest one of these muddled reports. However valuable the information may be, if its arrangement is such, and it is expressed in such terms that the kernel can not be extracted without hard and protracted study, it remains practically worthless. The director of an agricultural experiment station should be able to report his work in such a way that the intelligent farmer may be able readily to comprehend what a given experiment was intended to show, and what useful deductions are to be drawn from it. If he cannot do this, it is a conspicuous proof of his incompetency as a public teacher.

THE influential papers that so bitterly oppose the oleomargarine bill, and call upon the President to veto it should it be passed by the Senate, characterize it as a "vicious bill." They claim that it simply opens the way for unlimited fraudulent taxation; that if it is passed, any business that can command sufficient power in Congress may tax its competitors out of existence. These papers do not attempt to deny the fact that if oleomargarine had always been manufactured and sold for just what it is, legislation against it would be impossible. They are forced to admit that the action is taken solely against the fraudulent character of the business. Further than this, they very carefully neglect to suggest a bill that would be more appropriate than the present one. As to the taxation which may follow this opening, can there be too much of it? Almost every article of food is adulterated, and shoddy goods of all descriptions are manufactured and sold for a fraudulent price. If in passing the "oleo" bill Congress opens the way to effective legislation against various fraudulent practices, we may well congratulate ourselves on our part of the work.

THE Senate by barely one majority—22 to 21—last Monday, referred the Oleomargarine Bill to the Committee on Agriculture instead of to the Committee on Finance, which would have certainly failed to report it—in other words, it would have pigeon-holed it till the close of the session, next month. The Committee on Agriculture will report it favorably at an early day, and most likely the Senate will pass it in some shape. Of this there is no doubt if producers and consumers of butter and all lovers of honest dealing will bring pressure to bear on the Senators, directly by writing to them personally, and indirectly by urging the various State Senators and Representatives to take action in the matter. Only two Democrats voted to refer the bill to the Committee on Agriculture, and five Republicans voted against that reference. An analysis of the vote shows that of Senators whose terms of office expire March 3, 1887, and who must, therefore, be re-elected this year, ten voted for the reference and only four against it, while eleven refrained from voting. Of those whose terms expire in 1889 only four voted for the reference, seven against it, and 15 did not vote at all. Of those whose terms expire in 1891, eight voted for the reference, ten against it, and seven did not vote. Thus, judging from this point of view alone, it appears that those Senators who must soon appeal for re-election to their constituencies, were much more inclined to vote honestly as the people desire than those who imagine the people have short memories, and will forget or forgive their conduct before time for re-election.

ABOUT IRELAND.

No country in the world is attracting more of the attention of Christendom than Ireland just now. With an area of 32,531 miles—over 1,300—less than that of Indiana—it has a population of somewhat over 5,000,000 the number of inhabitants having steadily decreased since the famine of 1848, when they numbered over 8,000,000. Of the 20,819,840 acres in the island, 729 Englishmen own one-half, 3,000 other holders own the majority of the other half, and there are but 19,288 land-owners altogether. The tenants and peasantry pay a yearly rental of $65,000,000; while the income tax of the island amounts to $35,000,000 and the local taxes to $15,000,000 more, making an aggregate of $115,000,000 wrung from the wretched inhabitants of a island much less than Indiana, South Carolina, or Maine.

According to the statistics of 1880, the latest attainable, Ireland produced that year 4,000,000 bushels of wheat; 8,000,000 bushels of barley; 70,000,000 bushels of oats; 110,000,000 bushels of potatoes—within 60,000,000 of the entire product of the United States for the same year. She also produced 185,000,000 bushels of turnips; 60,000,00 pounds of flax and 850,000,000 cabbages, besides 3,800,000 tons of hay, and a vast aggregate quantity of fruit and garden truck. She had over 4,000,000 cattle, 3,500,000 sheep, 560,000 horses and 210,000 asses and mules. In that year she exported to England 700,000 cattle; over that number of sheep and nearly a million swine. What a marvelously rich land! But the people, how wretchedly poor!

COUNTRY GRAVE-YARDS.

IN a single verse Whittier has well described the old-fashioned country churchyard:

"A winding wall of mossy stone
Frost-flung and broken, lines
A lonesome acre thinly grown
With grass and wandering vines."

Who has not seen these dreary, dismal places? The grass grows out over the walks; blackberry vines climb over the graves; a few bushes lean over the wall. Through the broken gate the sheep come at will. A few wild flowers struggle through the tall grass as through ashamed to show themselves to the sun. Now and then some mourner cuts the grass from a few graves, or some member of the district takes the contract for mowing the whole yard for the sake of the hay. Careless feet go tramping over the graves, the frost throws the grave-stones out of line and the moss creeps over the letters. It seems as though our ancestors wished to make death appear as dismal and horrible as possible. There is no reason why this feeling should continue. Flowers, trees, shrubs and clean-kept graves add much to the beauty of the grave-yard, and take nothing from the sacredness of the place. In fact they add to it; their beauty gives a feeling of rest to the mind, a thought that our friends are resting in peace. Decoration Day has done much to improve our country grave-yards. The graves of the soldiers are always trimmed and beautified, and the crowds that annually come to witness the ceremony have taught the owners of grave lots a certain pride. The grave-yard should lose its old look of horror and repugnance. Each neighborhood should combine to take measures for beautifying the place. We do not believe in erecting costly monuments to the memory of the dead, but we believe the harsh and ugly features that so often characterize their resting places should be removed.

A GREAT HORSE SHOW.

THE American Percheron Horse-Breeders' Association intends to have a grand exhibition of Percheron horses in connection with the Illinois State Fair to be held at Chicago from September 6 to 11. Premiums amounting to $5,700 in money, and a large number of gold, silver and bronze medals will be offered. The jury of awards, always the most important feature of such exhibitions, as the accomplishment of the objects for which they are held must depend on their competency and fairness, will consist of three members, one to be appointed by the Minister of Agriculture of France, one by the Commissioner of Agriculture of the United States, and one by the Minister of Agriculture of Canada. Ample provision seems therefore to have been made to secure the best men for this responsible position. All pure-bred animals entered for competition must be recorded in the Percheron Stud Book of America. Is it intended by this provision to shut out the large numbers of excellent animals of the same race recorded in the Norman Stud Book? If so, the public at large will not be able to derive the best and widest information from the show, however satisfactory it may be to the importers and breeders of French draft horses, who form the American Percheron Horse-Breeders' Association. Apart from this, however, great care and foresight mark the rules made to govern the exhibition, and we predict a very large, interesting and instructive show of this magnificent race of draft horses. We trust, however, that before the opening of the exhibition, the breeders of "Percheron" and "Norman" horses, really the same race, will have amicably adjusted their differences so that all may exhibit their best stock under the same name, and have them recorded in the same Stud Book. A similar agreement has been found economical and in every way advantageous by breeders of cattle, as in the case of Holstein-Friesians; and of swine, as in the case of Duroc-Jerseys; and a like harmony in the case of French draft horses would be better for the breeders, and more satisfactory to the public than the present discord.

THE FARM BREED.

Is the best farm cow contained in the ranks of any of the present breeds of cattle? Many farmers are asking themselves this question. Breeders who desire to sell stock for breeding purposes, thus securing a price beyond what animals would bring at the block, or milk into the pail, are quick to answer "yes." Farmers who have no desire to sell breeding stock are by no means certain. There is no use in denying the fact that farmers with small herds of cattle, are still inclined to hunt for that much desired animal the "general-purpose cow." The tendency is to breed for special purposes, and no pure-bred animal can ever completely fill the place of a "jack of all trades." No breeder, however skillful, can put beef on the Jersey and retain the little cow's wonderful butter record, and there will always be "a great gulf fixed" between excessive milk production and excessive beef production. Can the desired result be more nearly obtained through high grades or cross-bred animals? For all practical purposes a good high-grade Jersey is as valuable as the average thoroughbred. Her price will be measured solely by the number of pounds of butter she can make, and for men who have no desire to speculate in pedigrees or sell breeding stock, this basis will be satisfactory enough. Cross-breeding is being more generally practiced than ever before. There are several herds in the country, in which this practice has been followed systematically, where the characteristics of what may be called a new breed have been developed. The offspring of a Jersey bull and a grade Short-horn cow has given excellent results in many instances, while calves from a Holland bull out of grade Devon or Short-horn cows are reported excellent for cheese dairies. The farmer who will drive his cows by a thoroughbred bull for the purpose of patronizing a scrub at a small price is foolish, but he is far from wise to buy thoroughbred cows, unless he can afford extra time for rearing, advertising and selling his calves. If he wants a "general-purpose" cow, he will be apt to find the best animal for his purpose in the off-spring of a thoroughbred bull of one of the dairy breeds, and a high-grade beef cow. The "general-purpose" cow may be known as the "farm breed" as distinct from the Jersey, Devon and the others. Bearing in mind the fact that each of the pure breeds represents certain fixed characteristics, a farmer can, at a small cost, develop a herd best suited to his farm.

THE RURAL'S NOTES ON LATTER-DAY STRAWBERRIES.

PRINCE OF BERRIES does not ripen evenly, and, though of good quality, will not be the berry for the million. Parry, its child, is earlier, larger, ripens more evenly, and is more prolific, though not so good in quality. Parker Earle, though the foliage is variegated, bears large berries and many of them. It is firm and of good quality. Lida, offered this Spring at the modest price of $1 each plant, is a rich, dark crimson in color, of fine shape, ovate-conical, generally pointed at the tip. It is of fair quality. It is a berry of some promise, if we may judge from spring-set plants. Jewell, what shall we say of this? In size of berry, in evenness of ripening, in keeping up the size during the season, in shape, in productiveness, in vigor of plant, it is all that could be desired. Could we add to its quality and a trifle to its firmness, it would be perfect. May King disappoints us as to earliness. But the plants are vigorous and productive, the berry of good quality, shapely and firm. It resembles the Crescent, but is larger. The Henderson is, at the Rural Grounds, a disappointment. The plants are variable, some being quite strong, others feeble. They are not, at all events, productive as grown with us. The berries mature as if protesting against ill-treatment, being variable in size and shape. But the quality is superb—in fact it is the best berry for one of its size that we know of. Were we to grow seedlings with the view of producing a *perfect* berry, we should strike for the quality of the Henderson combined with the other merits of the Jewell.

Bonanza is unique. Of all harlequin-shaped berries, this takes the prize. The plants are marvels of vigor, the berries often of remarkable size, but no two alike, except as to a swan-like neck, a characteristic of all. The berries are furrowed, coxcombed, winged, upside-down, wrinkled, round, square, parallelogramatic, rhomboidal, and every other shape we have ever seen in a strawberry, except a regular heart-shape. The plants are quite fruitful, the berries of good quality but generally hollow and mushy in the middle. Iron-clad is this year the earliest berry we have. The plants are thrifty and healthy. The berries are of medium size, about the shape of Crescent, firm and of good quality. We know of no better berry that is as early. Amateur is a variety with pronounced virtues and pronounced failings. The quality is better than that of Jewell. It is almost as productive, but the berries average smaller and softer. The plants are as vigorous as need be, but the leaves so o'ertop the berries, borne on slender peduncles, that the berries ripen, as it were, in a dense shade. The foliage of Connecticut Queen burns—the berries shrivel. Vineland Seedling is of little promise. Wonderful is of fair quality, medium-early, bright red, quite firm, variable in shape and size. Plants vigorous, but not remarkably productive. Queen of the Peninsula bears rather small berries, and is not worthy of introduction. Dimondale, also, had better be confined to the originator's grounds. Gardener's Colossal seems worthy of future trial. The berries are of fine shape, firm and good. Bubach No. 5 is promising. The berries average very large, bright red in color, variable in shape, firm and of fair quality. Iroquois we must not speak of yet. Bomba resembles Lida, but is not so prolific. Later in the season we shall again refer to the above berries, and to many others being tried this season for the first. Illustrations will accompany the best of them.

BREVITIES.

THIN out the fruit. If we would have large, fine fruit, a certain proportion of leaves to fruit must be established. It seems a waste to cut off a dozen bunches of grapes upon a single cane; a waste to destroy six young apples where there are but nine. Still a green plant can do only so much work. Take your choice between an abundance of inferior fruit or less of the best quality.

PICKING them off or shaking them into a pail of kerosened water is the advice given by horticultural journals to destroy the dreaded rose bug. Our use of pyrethrum powder in water, sprayed through a little hand-pump, with a rubber hose ending in a cyclone nozzle, was quite successful last year, and we shall try it again this. After receiving the spray, the bugs drop to the ground in five minutes. We use about two tablespoonfuls of the powder (first wet with alcohol) to two gallons of water.

ONE plot at the Rural Grounds is now especially attractive to all—a plot of roses, consisting of about 100 different kinds. Until last year we had avoided the cultivation of roses, knowing that they require care to rid them of insects and that they must be made a distinct study if one would write about them discriminatingly. But we are involved now and do not regret it. As we see the incomparable buds of the Hybrid Remontants unfolding, followed by the ever-blooming kinds, we exclaim again and again, "The rose *is* queen!"

UNCOUTH, illiterate Senator Sheard, of California, "Uncle George" of the "bhoys," who has been lifted into the United States Senate, not by his merits, but by his millions, is bitterly opposed to the oleomargarine bill, and says, "The bill cannot pass. I shall vote against it." Had not this boorish miner and prospector had the luck to strike a bonanza, he could not be elected a San Francisco alderman; yet his millions now give him power to injure one of the greatest industries in the country by giving him a vote in the highest legislative body in the Nation. This is the genius who, in eulogizing the late Senator Miller of California, capped the climax of panegyric and startled his fellow-senators, by declaring that he knew the dead Senator had at one time an opportunity of dishonestly making $100,000, and he didn't make it! Midas in the Senate legislating for the Nation, and unable to conceal his assinine trouble!

The Herdsman.

FORESTER 2D.

THE fine Guernsey bull, Forester 2d, 21 E. G. H. B., is shown at Fig. 260. He gained second prize at the Bath and West of England Show in 1884, and in 1885 he was first at the Brighton Show, and first at the Royal Show at Southampton. He is a son of Forester, a prize-winner in 1883 and 1884; while his dam, Queen 263, was first at the Salisbury Show in 1881.

Rural Topics.

THE DARK SIDE OF FARMING.

HENRY STEWART.

A prisoner on the farm; square pegs in round holes; success in the man, not in the land; a contrast; the bright and dark sides of farming.

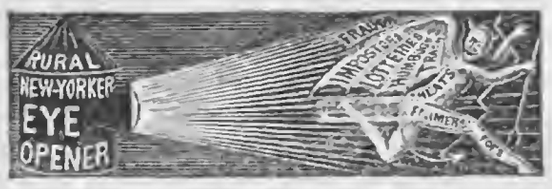
There is said, by poets, to be a silver lining to every cloud; but the one who sees the clond and not the bright lining, perceives only the dark side of it, ominous of storm and tempest. It is so with the life of many a farmer. It is quite true that while but one in ten of the professional men or merchants succeed in establishing themselves permanently in business, but one out of ten farmers fails to make some sort of success. But what sort of success is it for a large proportion of those who stick? Like the life prisoner bound by an iron chain to the stone walls of his dungeon, dark, dreary and hopeless, the farmer, bound by his penury to his farm, chafes and rebels against his equally strong bands, and remains, simply because he cannot escape from them. All he owns is tied up in his farm. He cannot dispose of it, and is bound to it for life. Working without hope and in disappointment, misery and wretchedness, he worries along, a slave to himself and to those who depend upon him for subsistence. No doubt this is the lot of many a farmer who has lost heart in his work, who has no sunshine to cheer him, but who exists always on the dark side of his life.

It has been said by a quaint old writer, who saw through a good deal of human nature, that human life represents a board with a number of round holes in it, and men are like square pegs trying to fit themselves into these holes. How true this is. How hard for a man to find his true place; how he frets and worries in his efforts to find it; how many never find it, but go mournfully and despairingly from one hole to another, but never find one to fit until the unhappy man drops into his last hole and is covered up out of sight, finding at last, let us hope, in some better life a better-fitting occupation and the rest which always evaded him here. And farmers are like other men, and have all their weak points and failings, and therefore necessarily come to the same end in their enterprises; but as a farm provides a home and at least a living, and cannot be abandoned easily, the farmer sticks to it and pines and frets at his lot from which he cannot escape, but in which he makes but a sorry attempt to live in the true sense of the word.

A common adage has it that "it is through the man and not in the farm" that success or failure is made. The same idea is given by Shakespeare in his lines,

> Men at some times are masters of their fates.
> The fault, dear Brutus, is not in our stars,
> "But in ourselves, that we are underlings."

A successful farmer is often next neighbor to one who never sees the bright side of his work or life. The one enjoys every comfort and many luxuries drawn from the farm. All his environments bespeak contentment and abundance. His air is that of a man satisfied with himself and what he has. The other shows by his actions and words that he is discontented; his home is cheerless and squalid; his fences are mean; his crops are poor; his stock is wretched; he and his family are careworn and dispirited; he is the victim of all sorts of accidents, and he is always complaining of his bad luck. And yet the farms adjoin; the soils are alike; the same sun shines for both; the same beneficient showers and dews fall upon each; yet one has all the bright side, and the other the dark side of life and work. The two men alone differ; one works perhaps no harder, and rarely as hard as the other, for it is not work or labor alone that avails—it is how the work is done, and the quality and character of it, that give it value and effect. Mere force brings a man to the level of his ox or his mule; it is reason, intelligence, thought; in a word, brains, that raise human labor above brute force, and give effect to it. It is thus that farm work needs to be done to be successful, to be lifted up above drudgery, to rise above mere labor, to become pleasant, attractive, alluring and profitable; and then the farmer, although the cloud of depression in business may hover over him, stands on that side of it which reflects the bright golden rays of hope, and the silver lining of satisfied and intelligent effort and conscientious, careful work, and the cloud is not dark, nor are there any low mutterings of disaster coming from it. But the unfortunate man on the other side of it sees only the darkness; and no cheering gleam comes from it to encourage him to hope that when the cloud has passed over, the bright sun will shine upon him, for this man sees only the dark side of farming.



WITHIN the past week we have noticed exposures of four cases in which people in widely separated sections were swindled by sharpers acting as canvassers for papers or magazines. In all cases women were mostly the victims; and in all cases subscriptions were taken at greatly reduced rates. Generally the fellow pretended to be a relative of some well known book and paper dealer, and sometimes produced a forged "authority" to make collections. There are a large number of honest, respectable men who act as canvassers for periodicals, and it isn't at all wonderful that a few rascals should embark in the business; but caution is needed on the part of the subscriber.

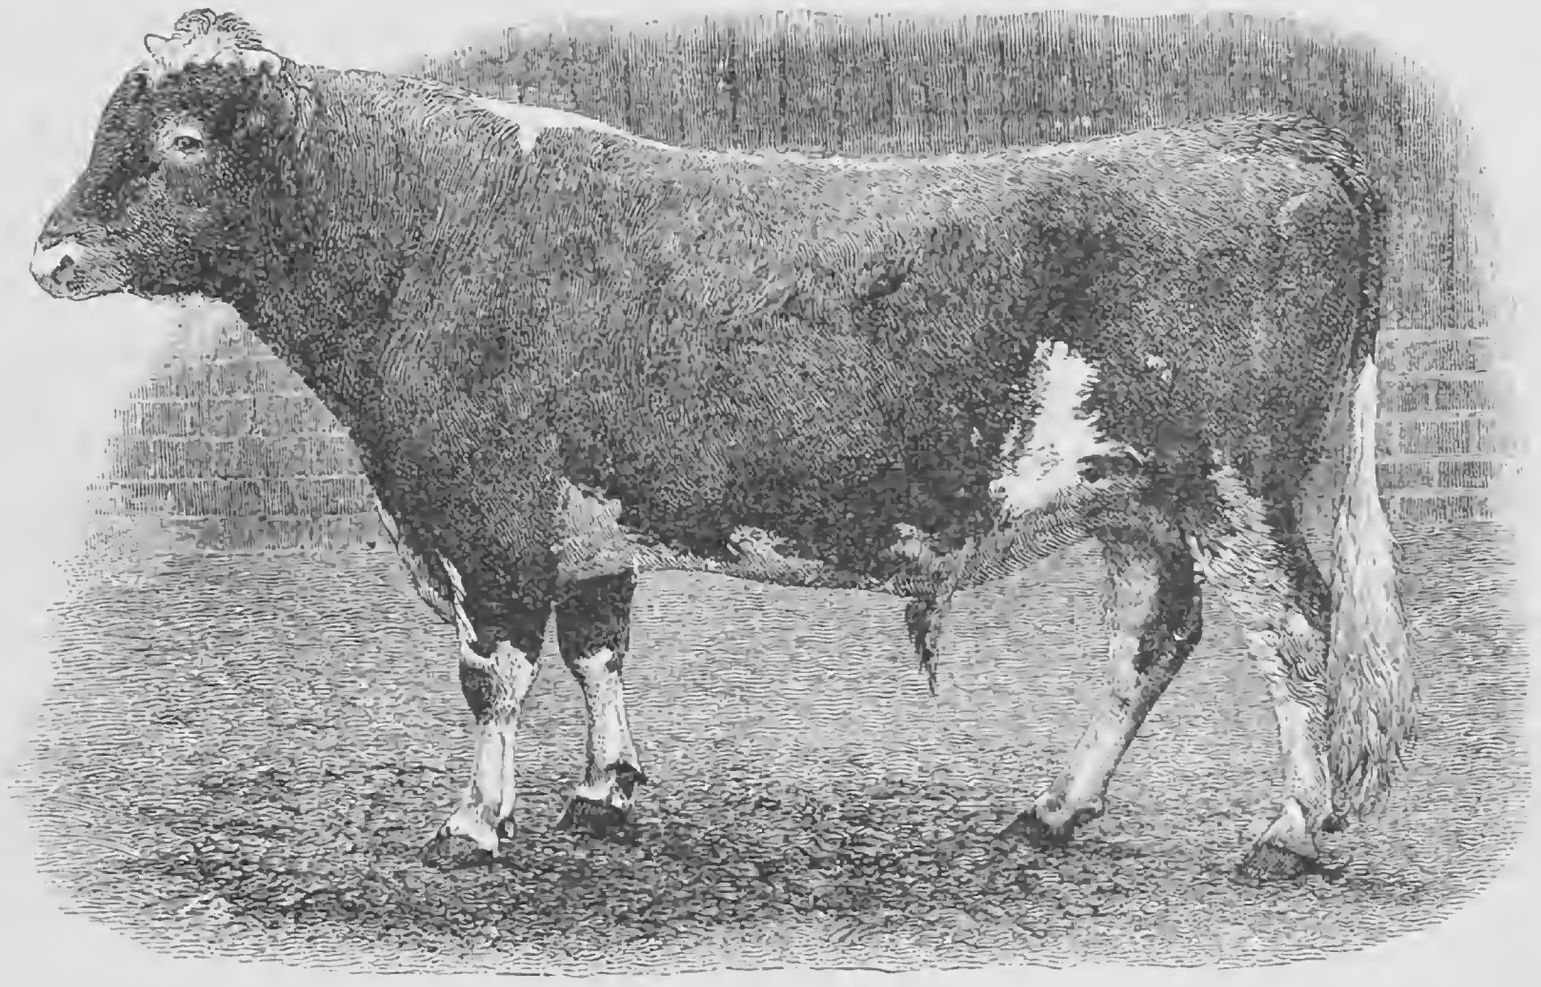
FARMERS AND COUNTRY MERCHANTS IN TROUBLE.—Assistance given to those financially embarrassed, on the most favorablee terms; it is worth your while to write us in confidence. Brown, Smith & Co., Brokers, Clark Street, Chicago.

Have you ever seen an advertisement of that sort? Of course, the form may be different; but have you seen one the gist of which was the same? If not, you haven't paid much attention to advertisements in all sorts of papers, even in those of the religious kind. A smart crook can get such an advertisement as the above in 1,000 country papers for $50, through an advertising agency. Have you any idea of the number of "farmers and country merchants" "financially embarrassed"? Well, on a moderate estimate, 2,000 applications would come through those 1,000 advertisements. Now, there are two ways of "working the game," and the Eye-Opener's notes contain several instances of each. In one case the crook wrote to each applicant, in confidence, that he had by bribery secured wax impressions of the genuine greenback $5 plates, and was prepared to supply $5 bills in any quantity at 25 cents on the dollar, to those who would assert on honor that they were in absolute need of money to tide over a present financial distress. The price to all others would be 50 cents on the dollar, and not over $1,000 worth would be sold to any one person. Of course, there were many injunctions as to secrecy, etc; many assurances that the bills could not possibly be distinguished from genuine greenbacks, etc. Did the "financially embarrassed" bite at the bait? Certainly a considerable percentage did, and in consequence become more "financially embarrassed" by the amount the crook swindled them out of by the old "sawdust game." In the other case negotiations were opened for loans on very favorable terms—about as favorable as those offered by that Cincinati four-per-cent-loan humbug—but in all cases a preliminary deposit of $5 to $20 was indespensable "to pay for investigation," etc., and as the securing of this was the only object of the swindler, he at one stopped correspondence when he got it.

The "Montreal Sanitary and Plumbing Association" is a swindle that came to grief early the other day; but no doubt the same or similar swindles will turn up in other places on both sides of the line. Geo. R. Watson, Secretary-Treasurer, lately rented an office, and issued a prospectus setting forth that the principal object of the Association was to examine, report and execute all drainage and plumber work for members' houses for a yearly subscription of $10 each. It also offered to analyze well and other water to see if it was fit for drinking purposes, for $5 per analysis. The names of prominent citizens, including that of the mayor, were freely given, without the slightest authority, as references, and the Bank of Montreal was mentioned as the bank of the Association. Of course, there were lots of gudgeons ready to jump at the glittering bait. Ten-dollar subscriptions began to pour in quite lively from simple people who expected $100 worth of work for their X. Agents were wanted for so driving a business at a salary of $600 per annum and commission; but, of course, a deposit of from $100 to $200 apiece was indispensable. How many such deposits the Secretary-Treasurer received is not known; but the evening he "lit out," one would-be agent called to deposit $100, and another to get rid of $200. The fellow had paid some of his debts with bogus checks, was arrested by one creditor, surrendered enough to pay that particular debt, and at once left the city.

The New York Medical Society has denounced the pretended Indian doctors or "medicine men," who, during the last few Summers have multiplied greatly throughout the country. These charlatans travel from place to place, setting up an imitation Indian camp in each. They draw crowds by a crude variety show, singing, dancing and athletic feats. The medicines they offer for sale are composed of a stew of herbs made in a kettle over a fire in presence of the gaping spectators. The better to bamboozle the ignorant and superstitious, they frequently accompany the manufacture with a farrago of savage incantations, quasi-mystic rights and hideous contortions. Through wholesome fear of arrest, the rascals are generally careful not to call themselves physicians, but they do call themselves "medicine men," and are, in the opinion of the Medical Society, medical practicioners in the eye of the law, and should therefore be suppressed by the authorities. Most of them have little or no medical skill, though a broken-down, disreputable physician with a diploma, is sometimes to be met with among them. Their "cure-alls" seldom do any more good than bread pills; but the rogues are generally too cautious to employ any ingredient which would do harm. The nostrum is generally a simple cathartic, no more suitable to any particular disease than purgatives generally are. Over a dozen such "outfits" have started from this city. The most elaborate of them had its headquarters in a disreputable "dive" at Chatham Square. The leader is a big, swarthy, long-haired, glib-tongued fellow named Doadens, *alias* "The Pawnee." He traveled last year as the "Big Wonder," and found so many dupes ("chumps" he calls them) that this season he extended the outfit so as to embrace five young women for Indian dances: an ugly old hag for a witch and fortune-teller: two male athletes for acrobatic feats, and two comic vocalists. All the women and most of the men are stained to pass as Indians, and there are also several genuine Indians from Canada or Western New York to sell bead-work and baskets. A three-card monte swindler will also be with the crowd, the "privilege" being worth $50 a week, as the profits are likely to be over $100. The whole party are quite vicious and disreputable. This is a sample of the other "outfits" in this line. Of course, no sensible man, woman or child will patronize the rascals, but, alas! no other crop in some places is so abundant as that of fools, and this crop swindlers harvest the year round.

Look out for the lightning rod sharks. The Eye-Opener has a number of notes of their swindles upon farmers in different parts of the country, especially in the Prairie States. A very active gang has lately been operating in Northern Illinois. Another has been swindling farmers in Central Iowa; and two others have been busily operating in Missouri. Some have crossed the Ohio also, and are working in Kentucky; while milder reports of other swindling gangs come to us from several other States. A great deal of hot indignation is felt against them wherever they have operated; but they care as little for the feelings of their victims as do the pickpockets and burglars for sentiments of the people they have preyed upon. Like the ruck of the criminal classes, these fellows have very little inventive ingenuity: and the mode of swindling practiced by them in one part of the country or in one year is the same as that practiced by similar vagabonds in another part of the country or another year. They generally get a farmer to sign what he supposes to be a contract, but often it is a note, which soon goes into the hands of "innocent holders," and so must be paid. "Innocent" is often used instead of "idiot." In the combination "innocent holders" of swindling paper, if the word cannot be used in this sense, it should generally have a meaning like that of "fence," indicating a sleek, hypocritical rascal ever ready, for a large margin of profit, to enable thieves and swindlers to realize on the results of their dishonest operations. Often the lightning rod sharpers, instead of getting a negotiable note, merely obtain a contract for three or four or more times the quantity of goods the signer thinks he is ordering. A few days after the advance agent has secured the contract, the gang appear in force, and insist on putting up a much greater number of rods, or rods of a much more expensive kind, than the farmer wants. He objects more or less resolutely, but they point to the contract, and bluster. Generally the farmer submits; often he compromises; sometimes he has spunk, determination and force enough to drive them from his place. From the E.-O.'s notes, this would seem to be the best plan. The rascals, knowing they are in the wrong, usually play a bluff game; but when resolutely met, they at once lower their demands, or slink away like the paltroons they usually are. It would be well for the farmers of every neighborhood to have a very distinct understanding among themselves as to the treatment to be accorded to all such dishonest scamps. Few of them would have the hardihood to practice their rascalities among a community known to be resolute and united in their treatment of such pests, and, then, too, each victimized farmer, knowing that he would be backed up by the sympathy, whips, boots and bull-dogs of his neighbors, would be less likely to submit to imposition.



GUERNSEY BULL, FORESTER 2D. Fig. 260. Re-engraved from the London Live Stock Journal.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

HOPEFUL AND CHEERFUL.

CLARA AUGUSTA.

THAT man is wise who never frets
Whatever trials rise,
Who beats in mind that 'neath the clouds
Shine ever blue the skies;
Who takes the ill luck with the good,
And keeps a trusting heart;
Content to struggle at his best,
And do his humble part.

He never looks with anxious eye
For troubles till they come;
He lets no grumbling atmosphere
Surround his happy home;
He keeps his patience, sweet and strong,
Whatever may befall,
And never doubts, because he knows
That God reigns over all!

He does not wait for happiness,
He takes it as he goes;
Around his pathway every day
Perpetual sunshine flows;
He knows this life a prelude is
Unto that glorious fate,
Which gives to man a wider scope
And grander far estate.

That man is a philosopher!
He has not lived for naught;
And happy he to grasp the prize
So many only sought!
And if we'd act with wisdom here,
And thus our days prolong,
Why let us take things cheerfully,
Just as they come along.

OF INTEREST TO WOMEN.

LITTLE black silk socks are a novelty for babies' wear, though many mothers still prefer the light colored ones.

The pretty belted Norfolk jackets in many colors, particularly black, tan and putty color are very popular for street wear, over skirts of different hue. The ever-useful Jersey may now be purchased in this shape.

In spite of ridicule both from the press and the stage, the immense bustle and tournure continues in vogue. Though a full drapery is pretty enough in moderation, when thus carried to excess it becomes a caricature. The new comic opera, "The Little Tycoon," containes several sharp hits at this fashion, and also at the flaming scarlet jackets now popular.

The fancy for portiere curtains and many draperies has resulted in the production of several new materials for such uses, some of them being surprisingly inexpensive. Cream colored scrim has made way for Mikado draperies, a gauzy brocaded cotton or linen stuff closely resembling the more expensive Madras curtains. Another cotton and linen stuff is "Bulgarian drapery," woven in broad horizontal stripes of contrasting colors.

A short time since, every hat and bonnet must be overloaded with stuffed birds. Muffs were adorned with them, and evening gowns bore positive garlands of these slaughtered innocents. Now it is learned that Queen Victoria, disapproving of this cruel fashion, has organized plumage societies, whose object is to discourage the style in every possible way. Thanks to the mania for English customs, and we hope, to our women's sense of justice, similar societies are being organized here, to the manifest disgust of the milliners, many of whom have a large stock of birds which will now be unsalable. This cruel fashion reached the very acme of repulsiveness at a great ball in New York last Winter, where a woman wore a yellow gown literally garlanded with stuffed canaries; so many innocent little songsters sacrificed to satisfy the vanity of one thoughtless woman.

Just on the bluff over the Hudson, at Riverside Park, northwest of Grant's tomb, is another solitary grave. Surrounded by an iron railing is a square block of time-stained marble, surmounted by a crumbling urn. On one side is this inscription:

"Erected to the memory of
An Amiable Child,
ST. CLAIRE POLLOCK,
Died July 15th, 1797,
In the 5th year of his age."

Poor little St. Claire Pollock! He is unknown to history, save as "an amiable child;" his father, sometime owner of Riverside Park, was an English refugee of mysterious antecedents, who left nothing of record, save this lonely little grave. On Decoration Day, some kindly hand placed a bunch of roses on the crumbling urn, in gentle sympathy of the little sleeper's solitary tomb.

"BE CHEERFUL."

FARMERS' wives and daughters can do much toward making the toilsome life of a farmer a pleasanter and happier one. When returning from the field, the barn, or the dreary winter's ride from the city, cold, hungry, and perhaps discouraged(as who is not at times?), the cheerful greeting of a smiling, neatly dressed woman, and more than all, the blazing fire, and a well-laden supper-table waiting only for father, will do much to lighten any burden, and to inspire him with renewed activity for business and life.

No good housekeeper or duty-loving wife delays the preparation of meals of the day till after or just before the coming in of the men from the field. How tedious it must be for them to be obliged to wait for food which should have been previously prepared! How unpleasant to them to move from this side to that, and from that to this, that you may get nearer to the stove or the oven, thus reminding them that they are in the way, when the fault is really your own!

Then, if you had trouble with your servants or the children have been unusually cross, do not weary your husband with your fretting and complaints, and unless you are sick enough to need his active attendance, or the advice of a physician, do not tell him of it; nothing weakens the strings of affection sooner than a constant fault finding disposition. Do not excuse yourself from the duty of making home pleasant, because your husband is cross and morose. May not your dilatoriness in household matters have something to do with this? At any rate, try the better way; make home cheerful and pleasant to your husband and children, and at the same time you will find that life and home will have new charms, and new comforts unfelt before, for you.

F. W. CLARK.

"CAN MONEY BE MADE BY FARMING IN NEW ENGLAND?"

THIS question is asked every day; some less ambitious souls contenting themselves with inquiring: "Can a living for a family be made by farming in New England?" These queries will be answered either in the affirmative or negative, as the standpoint varies from which the questions are viewed. Fifty years ago in the most fertile parts of Connecticut many a farmer with large families of children, not only made a living from his farm, but left his sons possessed of farms (not as large as his own, but large enough) and to each of his daughters a sum of money which in those days was considered sufficient. Now, the question arises, could this be done to-day? From our observation and experience we do not hesitate to say that without some income besides the produce of the farm to start with, it could not be done, without going back to a manner of life for which our young people are wholly unprepared. Let us see—we have in our mind two farmers in the town of—Hilltop (let us call it), and these examples might be multiplied indefinitely. One of these men's ancestors was poor, unlearned and originally from the rough parts of Rhode Island, which have remained rough to this day. A son of the family came to this town, where are now some of the model farms of New England, more than half a century ago. He bought a place of four or five hundred acres, heavily mortgaged. It was all cleared land, and the whole family were "tigers" for work; they had no superfluities, they kept no help, the eldest daughter milking her ten cows with her brothers. They were a naturally bright and intelligent, large family, of which the members worked to the extent of their powers the father and mother leading. They made the best cheese, not only in New England, but in the country; they raised the largest fields of corn, and the heaviest hogs in the town. In those days, the corn of the West was unknown, and the porkers of Chicago had not 'come to the fore'. The women spun, and wove and knit, the children sewed carpet rags, and braided whip lashes in the evening. The furniture of their home, though comfortable was of the plainest; they all ate in the kitchen together and all washed at the sink. They gave no parties except once a year, the "sewing society" they had but little time for visiting, and everything that could by any possibility be made at home, was home made. The older members were tough, they worked early and late, and they thought all the rest could do the same. One young creature, of more delicate fibre than the others, succumbed, and went to rest, but the others worked on. The mortgage was taken up before many years, and in the end, the father died leaving each of his sons a well cultivated farm, and each daughter with a lien upon her brothers, and a jointure sufficient to pay a small board. Now for their descendents; some have gone West, and those who still occupy the farms make their chief profits not from farming, but from city boarders, thus having the prospect of a shorter and easier way to competence than their ancestor.

Another farmer whom I have in view inherited his farm and lived with his family, a wife and one child upon the homestead, and died leaving a comfortable estate.

But was it made by farming proper? Hardly, since the greater part of his gains came from "cattle trading," for which he had a wonderful talent, and with a very frugal wife, his money accumulated. There are very few of the proprietors of landed estate in Hilltop who can be said to live by the produce of their farms. There can be counted within a radius of three miles from the centre of this very grave old Puritanic town, almost settled by the passengers of the Mayflower, at least 10 or a dozen of the best farms belonging to Irishmen, bought and paid for. They can live on the product of their farms and bring up large families, which must surely people these parts, for the original stock is growing "beautifully less" every year. They know how to live economically, they hire no help, but change work as our farmers did in olden time.

They buy far more than the earlier inhabitants of whom I have written. These, our adopted citizens are industrious, frugal, excellent farmers, and they all came here penniless within the last 30 years. This we fancy is the general state of things throughout New England. Near cities or large towns, of course farming pays better, and in some places the summer boarders bring traffic in garden stuff, small fruits, etc. From our standpoint then we conclude that a farm is a wonderfully pretty plaything for a man of large means, a delightful home to one with a thousand or two to make both ends meet, and a means of living, to a family accustomed to self denial and not afraid of constant hard work.

CLAUDE.

PHEBE'S RAG CARPET.

ALL through the long, bright Summer, Phebe was busy as a bee in all her spare moments over a little project she had in hand, which should add much to the home comfort through the long, cold Winter. She was bent upon making a strong rag carpet to spread down on the bare floor of the family room. She diligently gathered and saved all the scraps and worn-out garments about the house, and if she did not "beg" like our fair workers in "crazy patchwork," she was very thankful when kind aunts and cousins sent her even a small contribution to her stock. A little basket was kept always handy, and when she had some waiting minutes, you would hear the click of her bright shears cutting up the scraps into strips, and the pile grew very fast. When it came to sewing, even the boys were ready to help, after she taught them the science. It was a poor day when one great ball was not added to the large basket, and it was just a recreation to Phebe to slip them into a large sack and weigh them every few days.

"But I am afraid we can never afford the weaving," said mother rather despondently.

"Only get me the warp, mother, and I can weave it myself. I've talked it over with good Mrs. Booth, and she will let me use her loom and teach me also. I have woven a little on her carpet sometimes."

So the work sped, and on a rainy day in November the long widths were tacked down, the furniture re-arranged, and the family took possession that dreary evening, with a sense of comfort and riches, that only such well-earned possessions can ever give. The baby crept about on the warm floor with great delight; little Nannie sat down on the carpet to point out bits of goods which she recognized; father praised Phebe's industry and perseverance; mother reflected with pleasure on the great saving of work it would be, as well as the added comfort; the boys all liked it, so on the whole it was a happy day for Phebe. It was a great enterprise for a girl of 16 to carry through, and she deserved all the praise she received. But the gain to her was more than the gain to the family. She had learned many valuable lessons over it, and not the least was how blessed it is to work for the good of those we love. She had learned to overcome difficulties, and many a time afterwards the thought of that rag carpet encouraged her to feel that "where there is a will there is also a way."

That good carpet deadened many a discordant sound, and diffused a sense of comfort through the humble room. So the influence of this eldest daughter was a blessing to all the household. Yet while she was ministering to the happiness of all the household by her daily walk and conversation, she was in the most substantial manner contributing. Those who live for self are of all others most unhappy, and those with the widest hearts are the happiest.

OLIVE.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

MY FIRST DAY OF HOUSEKEEPING.

I SHALL never forget it, and I shall always hold that gas stove responsible for all its disasters. It was nearly two years ago, and though I was not a novice in housekeeping, yet common housekeeping is very different from trying to live amicably with a gas stove, especially if you are not in the least familiar with its disposition.

It was a pleasant home to which "John" took me after our short wedding trip, and his mother—a sweet, gentle lady, never strong—had quite worn herself out in the attempt to get up a lovely little reception for us. So the next day she was obliged to keep her room most of the time, and "John" staid in the house an hour or two to show me where things were and initiate me into the mysteries of that awful stove. It looked harmless and seemed so easy to manage that "not a wave of trouble rolled across my peaceful breast" when I set the milk on to make some blanc-mange. Alas for human hopes and ignorance! I had not the smallest idea that that little circle of fiendish blue flames could heat anything so quickly, and before I knew it the milk had boiled over and put out the fire.

I wasn't sure what to do at such a crisis. John had gone, and not daring to run any risk, I had to go up stairs and ask mother. She told me, but I am sure she did not realize the situation or she would not have detained me so long to talk. I couldn't leave at once without seeming rude, and although it was but a few minutes, I was haunted by a vague fear that something might be going wrong with that cooking machine, and at the first possible moment hurried down. Something was wrong, for during my absence the cap, or whatever it was, had cooled so that gas was no longer generated, and as I had left the valve open, the fluid had begun to flow. Not knowing what else to do I applied a match, and then, oh! then, my countrymen! there was a blaze that shot nearly to the ceiling. I was terrified—I was frantic. John wouldn't be back till noon; I couldn't bear to alarm the invalid mother unless obliged to, and I dared not leave that rampant blaze to its own wicked devices long enough to go to the neighbors for help. There seemed nothing to do but stare helplessly at the flames, for nothing appeared to be on fire except the stove, or rather the space above it, and what good could it do to throw water on gas? I was fairly petrified with fear lest the ceiling should take fire. Had I come to that house only to burn it up the first thing, and would no one come to help me?

Gradually the fire lowered, and though I had no assurance that the whole reservoir would not take fire next, I stood the ground "whence all but me had fled," and bravely—did nothing. When at last the flames contracted to proper dimensions, I turned the valve and extinguished them in the legitimate way. Then I pared some potatoes and once more approached my dread enemy. A gas stove has no stability whatever; it is full of freaks and seems to be a combination of witches, demons and gun-powder. Every time I lighted it, it would spurt or hiss or puff up or out, or do some queer, jerky, spasmodic thing to keep my nerves lively.

Dear me! how those potatoes did boil! and before there was scarcely time to turn around the water had all turned into steam and there was an odor of scorched potatoes. They weren't all burned, however, and what were good I put into a crock and proceeded to mash. At the very first lunge of the masher (and it was quite a moderate sort of lunge, too) the bottom of the crock broke. I saved most of the potatoes from that second wreck, and wondered if I was destined to become a dish-smasher as well as house-burner. Oh, dear! I really do believe I got something else for dinner on that direful day, but for the life of me I can't remember what! I only remember that the gentle mother considerately praised "those nice potatoes." I shall always bless her for that, but I reserved the privilege of smiling privately over the dish-pan, and to this day she does not know what painful vicissitudes those potatoes and I experienced. John told me that unlucky crock and several of its boon companions had become badly cracked by being used as cooking utensils over the intense heat of that stove. I had not seen the cracks, so, after all, that same evil-minded stove was to blame for the breakage, and not my gigantic (?) strength or carelessness.

By the time the day was ended, I wasn't in love with that gas stove, and advised John to divorce it. He agreed, admitting that with such a dangerous thing in the house, a serious accident was only a question of time. He knew a nice family with whom they had boarded before building, that he thought would like to buy the stove, but he had too much regard for their welfare to wish to blow them up with it, he said, and concluded not to offer it to them. It was finally sold at auction. We never knew who bought it, but devoutly hope they are still alive, sane and whole. I never used it after that one day, and I never wish to behold another. However, my innate sense of justice compels me to say that gas stoves do have a few virtues: they take up but little room, do not look like stoves, they cook rapidly, have no smoke, ashes or dust, and do not heat up the room at all. Anybody who wants one is welcome

to have it, but if you value life, happiness and home, my advice, born out of that day's bitter experience, is—don't! RENA ROSS.

AN EXTENSION TABLE.

SOME years ago, we greatly felt the need of an extension table. The purse would not admit of a new one, and the head of the household was too busy to make one. The thrashers were to be on hand within the week, and unless I could in some way remedy the matter, I would be under the necessity of setting the table a second and perhaps a third time; thereby making the work a good deal harder, when there was enough and to spare, simplify it as best we could. But when a "woman wills, she will and there's an end on't," and I *willed* to enlarge the borders of our family table before that busy day should arrive. At the barn I found a wide hemlock board, with any amount of slivers. But though Jack-plane and I were not very well acquainted, we managed to make that board passably smooth, while the hand-saw did us good service in fitting the false leaf to the exact width of the table. A couple of cleats were nailed on the under side of the board with about eight inches extending beyond the width, after the fashion of Fig. 261.

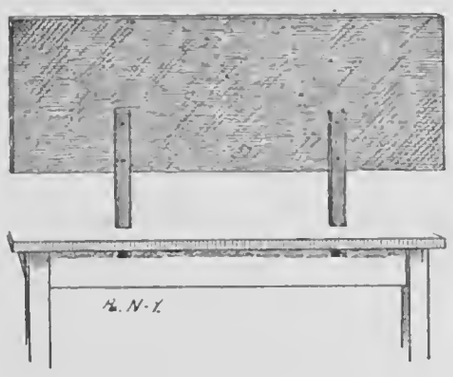


Fig. 261.

A small augur and chisel were next used for making a couple of mortices in the end board of the table, corresponding in distance apart, and also in size and depth, with the cleats, which were to slide into the mortices; and behold! I could seat three or four more at the table; another leaf, and there was room enough for most occasions in our farmer's family.

Last Summer a friend told me that she took the top or bed of the table off, and sawed out the pieces in the end board of the table, to admit the cleats. Afterwards she got a carpenter to make her a kitchen table, and that was as long as her fall-leaf table was wide, so upon great occasions she could extend her table the whole length of her dining-room.

MAY MAPLE.

HOUSEHOLD HINTS.

BUTTER THERMOMETERS.

ALMOST every one has noticed the variation in the number of degrees in heat and cold indicated at the same time by different thermometers. I have learned that thermometers used for testing the warmth of cream are not always to be trusted; that is, while with one 62° in Summer and 65° in Winter is the proper temperature to bring butter satisfactorily; with others, other degrees must be indicated to attain that end. The thermometer we now use is so made that we are obliged to have the cream at 68° to gather the butter, and in the Winter at 70°. Any one used to churning can tell after a few trials just where the mercury should stand. We had considerable needless wearisome work to do last Winter before we learned where the trouble lay.

SMOKING MEAT.

When Massachusetts was our home, there was no trouble in getting hams cured and smoked, for in every village there was some person that would do that work, and had proper conveniences for it. On the prairies, every one must wait upon himself, and be independent of others by his own ability to do what must be done, if he would prosper. A Western boy made an inexpensive smoke-house of the materials right at hand. It was so satisfactory that some one may be helped by a description of it:—A little trench was dug leading from a small hole in the ground; over the hole was turned a headless barrel. In the trench were laid several sections of stove pipe. The hams to be smoked were suspended from the bottom of the barrel. The pipe was covered with earth to help the draft. The cobs and fire were put in the end of the pipe farthest from the barrel, and a broken shovel acted as a damper when needed. If only one piece of pipe is used, the meat may be burned.

SALTING PORK.

Whether the alkali in the water is the cause of it I can't say; but fat pork packed in a barrel with layers of salt, and cold water turned over all, would not keep the whole year without scalding the brine. While I was going through that troublesome process our Western boy said. "If you will turn your brine *boiling hot* over the pork you will never need to scald it, that is mother's way." I tried it and found it just as he said. Now I make my brine strong enough to hold up an egg, and turn it, boiling hot, over the pork, which has been cooled from the animal heat, and packed in a barrel with slight sprinklings of salt, being always sure to keep it under the brine with a weight.

SALTING CUCUMBERS.

I make my brine for salting cucumbers for pickles, by keeping the salt and cold water in a keg and stirring it until enough is dissolved to bear up an egg, or a medium-sized potato if more convenient. The fluid is dipped out and put over the cucumbers, and more water and salt are put together for the next time of need. In this way there is no waste of salt and no uncertainty about the cucumbers being properly salted.

PICKLES.

When needed for pickles, I fill the tin boiler with cucumbers and place them over the stove, covered with cold water, and bring to a decided boil. Drain this water off and put on half vinegar and half water, and throw in a little alum to make them hard. Bring to a boil. Let them stand in this over-night or longer, if not in haste, in an earthern or wooden vessel. For the third time put upon the stove with clear vinegar (and spice if desired) and when cold they will be found to be sour enough for use. Good pickles can be made in a very short time in this way.

If a cloth is laid over the top of salted cucumbers, under the weight, the scum that will arise can be easily removed by taking off the cloth and rinsing it. S. E. H.

DOMESTIC RECIPES.

TOMATO FIGS.

TAKE small, red tomatoes, scald and skin them quickly, breaking them as little as possible, add one-third their weight of granulated sugar, boil slowly until they are clear, take them out and spread them on plates; boil the juice till it is very thick, pour it over the tomatoes, and dry them in a warm oven. When dry, pack in layers in a clean paper box, first sprinkling sugar over the bottom of it, and also between each layer, pack tightly and cover closely, and you will have a nice confection for Winter. AUNT EM.

HUCKLEBERRY CAKE.

One cup of butter, two cups of sugar, three of flour, five eggs, one cup of sweet milk, one teaspoonful of soda dissolved in warm water, a teaspoonful each of cinnamon and nutmeg, one quart of ripe, fresh huckleberries thickly dredged with flour. Stir the butter and sugar to a cream, add the beaten yelks, then the spice, flour, whites beaten stiff, soda and fruit. Stir in the huckleberries with a wooden spoon or paddle so as not to bruise them. Bake in a moderate oven until a straw used for testing the cake comes out clean from the thickest part. This is a delicious cake that deserves to be better known.

DELICIOUS LEMON JELLY CAKE.

Two cups of sugar, one-half cup of butter, one cup of milk, three eggs, one teaspoonful of soda, two of cream-of-tartar and three cups of flour. Bake in five thin layers. For the jelly grate the rind of three small or two large lemons, and add the juice of the same with one cup of sugar, one egg, one-half cup of hot water, one teaspoonful of butter and a tablespoonful of flour made smooth with a little water. Boil, stirring until it thickens. Spread between the layers. This cake will be better if kept a week or 10 days before eating. HATTIE M. RUDD.

[Will the above contributor please send her address to us at River Edge, Bergen Co., N. J.—ED.]

QUESTIONS ANSWERED.

GENERAL TRAINING COOKIES.

EMILY J. BOWEN asks for a cookey receipe of 50 years ago. The children, she says, gave the above name to the cookies as they made their appearance upon "General Muster" day.

ANS.—The only "Muster" day recipe that we have at hand is one for Ginger-bread, taken from the Buckeye Cookery. The ingredients are: One gallon of molasses or strained honey, one pound and a quarter of butter, a quarter of a pound of soda stirred into a half tea-cup of sweet milk, a teaspoonful of alum dissolved in just enough warm water to cover it, flour to make it stiff enough to roll out. Put the molasses or honey into a large earthen dish, add the soda and butter melted, then the other ingredients. Mix in the evening and let stand over-night. In the morning knead it a long time like bread. Roll out into squares half an inch thick, and bake in a well-heated oven. To make glossy, rub over the tops just before putting in the oven, a mixture of beaten egg and sweet cream—equal proportions.

RASPBERRY VINEGAR.

M. A. B. asks for a recipe for the above.

ANS.—Put ripe, red raspberries into an earthern dish and crush. Cover with pure cider vinegar, let stand over-night, strain, throw away the pulp, put as much fresh fruit into the dish as you used before, crush and cover with the strained juice. Set aside for the day. The next morning strain and to each quart of this juice allow a pint of water, and to each pint of the mixture a pound of lump sugar. Heat, stirring to dissolve sugar. Skim as it heats. Just bring to a boil, strain and bottle, making the corks secure with wax. A few spoonfuls of this mixture with a little sugar in a glass of ice water will be found most refreshing when the mercury is in the nineties.

Worth Knowing.

THAT, as a household remedy, for children and adults, Ayer's Pills are invaluable.

THAT, in Colds, with headache, backache, coated tongue, symptoms of fever, and a constant feeling of weariness, Ayer's Pills will often effect a cure when other remedies fail.

THAT these Pills are sugar coated, perfectly safe to take, do not gripe, and contain neither calomel nor any other dangerous drug.

I have used Ayer's Cathartic Pills in my family for the past thirty-five years. For stomach or liver troubles, or any irregularity of the bowels, and in case of Colds, Ayer's Pills are unequaled. I am never without them.—Frank Tisdale, Montpelier, Vt.

Ayer's Pills,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists and Dealers in Medicine.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

FRENCH ROMAN HYACINTHS

I now offer from stock grown by myself French bulbs of finest and best germinating quality, as under: Roman Hyacinths, 1st size, $2.25 2d, $1.8 Narcissus, paper white and double Roman, $10 Lilium candidum, $15.50 Parisian Hyacinths, $11 per 1,000 roots, f. o. b. steamer, Marseilles. Orders respectfully solicited

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

News of the Week.

HOME NEWS.

SATURDAY, June 12, 1886.

THE returns for the election just held in Oregon summarized are as follows: The Republicans re-elect Herman to Congress by 1,000 plurality, and also elect their candidates for Secretary of State, Superintendent of Public Instruction, and Public Printer. The Democrats elect their candidates for Governor, Treasurer, and Supreme Judge. As Governor, Secretary of State, and Treasurer constitute the board for the management of all State institutions, the Democrats will have control of the State affairs for the next four years. McBride (Rep.), for Secretary of State, has 400 plurality, and Strain (Dem.), for Supreme Judge, 150 plurality. The official figures will not change the result. The Prohibitionists polled about 2,000 votes. Oregon has always been reckoned a Republican State; but the policy of the Republican party on the Chinese question has worked a partial revolution. ....The Ohio Dow Liquor Law is sure to cause great excitement in every township. The Cincinnati Police Commissioners pushed a test case through the Common Pleas and Circuit Courts without the knowledge of rum-seller or newspaper, and is is now before the Supreme Court. If the newly imposed tax isn't paid by June 20, the County Treasurers are compelled to collectit by execution.....The Chicago Times charges that $127,000 were divided on Monday evening among less than 20 aldermen, as a bribe, by the North Chicago Passenger Railway Company for permission to do as it may please in the streets through which its lines run. Price per alderman, "low-down" $1,500 and under: "respectable," $8,000; "high-toned," $10,000 and over. Charles J. Yerkes, President of the bribing road, was convicted of stealing a check for $33,048.50 in Philadelphia in 1873,and sentenced to the penitentiary for two years and six months, but was pardoned after seven months for political reasons.....Land Commissioner Sparks has appointed "Captain Jack" Crawford, of New-Mexico, custodian of the abandoned Fort Craig Military Reservation in New-Mexico vice R. Amijo, resigned. It is understood that Crawford will soon join General Miles, as chief of scouts, in his campaign against the Apaches. Miles telegraphs that for 36 days his forces have been unintermittingly pressing hard upon Geronimo's band, and must soon kill, capture or drive them into Mexico. In this time, however, the red devils are known to have killed 13 scattered herdsmen, prospectors and settlers; how many more will never be known till Judgement Day.....There is a rumor that a syndicate of European capitalists are to buy the Sandwich Islands for $10,000,000. The king "is not adverse" so long as he secures most of the money..... ...Monday at the Local-option elections in N. C., the Prohibitionists carried 12 out of 21 towns reported. .....Minister Winston, lately sent to Persia, has urgently pressed his resignation, which has been accepted. Infinitely prefers Chicago to Teheran.....Senator Blair's Pension Bill provides for a uniform Pension of $12 per month for all Union ex-soldiers and sailors of the ate war now unable to maintain themselves—no distinction as to rank. Likely to pass if there's time..... ....The Senate has passed the bill appropriating $150,000 to indemnify the Chinese for the Rock Springs, Wy., massacre and outrage; also a bill to legalize National trades-unions. .... The House has passed the bill repealing the Pre-emption, Timber Culture and Desert Land Laws, by a vote of 183 to 40. Many protests from the Far West, especially from Kansas; but they were thought to be mainly from land-grabbers, their attorneys, agents or henchmen..... .....Senator Dawes wants to issue $30,000,000 in $1 bills and $35,-000,000 in $2s to relieve the present scarcity of small bills. They are to be in place of bills of larger denominations. There are now only about $18,000 in ones, and about the same in twos.....Representative Judge Kelley, of Philadelphia, has deservedly lashed Representative Gen. Wheeler, of Alabama, for having inserted in the Congressional Record, a bitter attack on the late Edwin M. Stanton, our tremendous War Minister, in a speech supposed to have been delivered in the House; but which was never made there..... .....Congress will hardly adjourn before the latter part of July..... The Mass. Senate has passed a bill increasing the allowances for good behavior on sentences of jail birds. On all sentences of a year or longer, it takes off two months for each of the first two years; four months for each of the third and fourth years; and five months for each succeeding year. It is to be retroactive so as to be applicable to convicts now in prison. Aren't judges who think a criminal really deserves a long punishment, likely to take the probability of such liberal commutation into account in passing sentence, by adding considerably to the term?..... ....The fishing difficulty still continues, with greater vigilance on the Canadian side, and greater exasperation on the American. The latter are not allowed to fish within three miles of a line drawn from one headland to another; while they insist they have a right to fish within three miles of the coast, in bays or outside. Mackerel fishing is now the best; and mackerel schools run mostly inside the "three-mile limit"—poor luck, therefore, for Yankee fishers. Canadians are allowed to import, duty free, fresh fish for immediate use, sounds, etc.; but the Bontelle Bill now before the House, imposes a tax on these, and our fishermen insist that it should be passed at once. There is less disposition now than ever in Congress to form a new reciprocity treaty with the Dominion.....Much distress among the coasting population of the Maratime Provinces from being prevented from selling bait, ice, etc., to Americans. Negotiations between the American and Imperial Governments necessarily slow, but friendly... .....Col. Richard M. Hoe, who revolutionized the printing press, died at Florence, Italy, Monday. Born in New York September 12, 1812; studied a little at school, but got a thorough knowledge of practical mechanics in his father's machine shop. Perfected his rotary press in 1848—the basis of all improvements—could print 10,000 copies an hour; now every rotary press can print 20,000 to 25,000 copies an hour..... ..Mr. Bodwell, Blaine's candidate, received the Republican nomination for Governor of Maine, Thursday, by 882 votes against 201 for Dr. Hamlin. Mr. Bodwell is 68, and very rich, though in 1834, he was a farm laborer at $6 a month. For a dozen years he has been quite noted as an importer and breeder of thoroughbred cattle. Blaine is now considered to have fairly entered the field as Republican candidate for the Presidency in 1888. There's no doubt he has the strongest following; but is it stronger than that of all other prospective candidates combined? Is he the man that would have the best chance of getting elected? These are the questions puzzling politicians.....President and Mrs. Cleveland on the day of their marriage sought retirement in a nice cottage at Deer Park, Maryland, where they remained quietly, receiving a few friendly visitors, until last Tuesday, when they reached the White House in the evening. Since then they have been living the lives of ordinary folks, he attending to his official and social duties; she to household matters, receptions, etc. The amount of gush and jenkinsism expended on the marriage in the papers has been simply nauseating,..... ..Ex-President Arthur is still only so-so—no better or worse; confined to the house..... .....There seems to be a good deal of rivalry or disagreement between the Democratic leaders, Randall and Holman, in the House, and it is likely to hamper or block much legislation.....'Maxwell," *alias* "Brooks," the murderer of Preller, in St. Louis, over a year ago, has been convicted of murder in the first degree, but is seeking a new trial—likely to swing, however, and very justly, too..... Sec. Manning has gone to the Hot Springs, Ark.....Dakota is getting over her craze for dividing the Territory, and would like to be admitted as one big State. If this desire had come earlier she would probably have got in; but it is now so late in the session that her admittance this year is doubtful..... .. The Rhode Island Legislature refuses to legislate or remove from office the obnoxious Chief Constable, Brayton. After all the talk he is bound to do his best to show he can do the square thing, and enforce the law.....All over the country the Prohibitionists are taking an unusually active and prominent part in political warfare, and generally act independently of the other parties. Republicans are considerably disturbed, as the great majority of the prohibition vote will leave their party. Many attempts have been made to compromise matters, but generally in vain..... Never was there a hotter fight than that between Gen. Gordon and Maj Bacon for the Governship of Georgia. Hitherto the Major has secured more delegates than the General, and many of his prominent supporters say if the latter carries the convention, they'll bolt.. .....Canada will continue to pay a bounty of $1.50 a ton on Canadian pig-iron made from Canadian ore till July 1, 1889, and give $1 a ton for three years thereafter..... ....Sunday last, Catholic Archbishop Feehan, of Chicago, confirmed 117 convicts in the decorated chapel of the State Penetentiary, Joliet, Ill.....Gov. Hill has signed the bill which adds 500 men to the police force of this city, making the whole number 3,250. Patrol wagons are also to be introduced. Increase of city, and danger from strikers and Anarchists justify the measure..... A Washington fund for buying Mrs. Hancock a home now amounts to $10,000.....The valuation of New York State has increased $275,000,000 during the past year, or about nine per cent., and now amounts to $3,266,-609,000; the total tax for State purposes was $9,536,000.....The police of East St. Louis have all—14—been discharged, being accused of being in league with a gang of professional burglars to rob the city treasury, a bank and the stores and homes of the wealthiest citizens.....Prince Augusto Leopold, heir to the Emperor of Brazil, arived here the other day, and is to see a good deal of the country, as his genial father did a few years ago. .....The Senate election Committee find the report of the Ohio Legislative Committee on the election of Senator Payne so empty of facts to show corruptian that they have unanimously decided that nothing in it calls for an inquiry—there has been too much flinging of dirt in this case.... ....A Territorial form of government is being urged for Alaska, by Gov. Swineford of that place. No one can buy a foot of land there, and wood for the mines can be got only by stealing. House Committee on Territories hesitates on account of the policy to be adopted towards the Indians there...Litchfield, Ct., was almost entirely cremated yesterday.

FOREIGN NEWS.

SATURDAY, June 12, 1886.

THE second reading of the Home Rule Bill was defeated early Tuesday morning by 30 majority in the House of Commons. The majority was not expected to be over 10 either way. Doubtless some members, finding the bill would be defeated anyhow, voted to increase the majority in the hope that if it were large, Gladstone would not care to dissolve Parliament and appeal to the country. This he will do, however, as soon as the pressing business is over—probably about June 20. The next Parliament will then be ready to assemble about the middle of July..... .....The Conservatives, under Salisbury; Liberal-Unionists, under Hartington: and disgruntled Radicals, under Chamberlain, will aid each other wherever possible to defeat the Liberals under Gladstone. All the most liberal contributors to election expenses are on the side of the Opposition; for the aristocracy and plutocracy of great Britain and the landlordism of Ireland are bitterly opposed to Home Rule, while Gladstone trusts mainly to the democracy of the United Kingdom for victory. Last year he secured an increase of over 2,000,000 in the number of voters, all among those whose poverty had deprived them of suffrage, and though these have not yet been properly registered, most of them are likely to support him.....England is in no position to have Ireland an enemy in the rear as she faces Europe at present. War in the East may break out any day. Russia has lately appropriated a large slice of Persia adjoining Afghanistan, which was lately conquered by England, and whose king is a paid English puppet. Russian railroads are being pushed rapidly to the Afghanistan frontier, and in any trouble with England the Czar could send an army by land into India much more easily than England could send one by sea. The wretched Hindoo ryots, or peasants, are holding vast secret assemblies, and defy the best Government detectives to discover what's up. A "home rule" agitation is growing in India, and discontent is increasing on all sides. It is feared Russia is secretely fomenting the trouble. England's influence is weakened in peace by Ireland's discontent, and her power would be crippled in war by Irish turbulence or rebellion..... ....Parnell in his speech in Parliament charged that a member of the Conservative Government told him at the last election that the Conservatives would give Ireland Home Rule in return for Irish votes at the polls, and the Earl of Carnavon, then Lord Lieutenant acknowledges that he made such a promise. Much rejoicing among the Home Rulers. .....One of the strongest objections to Home Rule was the fear of handing over poor Protestant Ulster to the tender mercies of an Irish Parliament. This will lose much of its force owing to the turbulence of Protestant mobs in Belfast and Lurgan during the week, especially in the former head-center of Orangism. An absolute reign of terror has prevailed there. Fierce mobs have assaulted prominent Catholics, wrecked and plundered over 150 private houses, demolished several liquor stores and made hogs of themselves on the contents. They have assailed and several times defeated the police, who, on different occasions, were forced to fire among them. Cables say 15 are known to have been killed, and over 100 wounded among the mob, and many of the police have also been injured. Magistrates, clergymen, the riot act, and all other authorities and laws have been fiercely defied, and the nights have been made hideous and the days terrible by "the scum of Belfast." Now the mob is still riotous, but troops patrol the streets; the police have received strong reinforcements from Dublin, and for the present further outrages are impossible, but the mob threatens to take vengeance on the police and Catholics when outside aid is withdrawn. It must be remembered that nearly half the population of Ulster is Catholic, and that the Parnellites elected a majority of members of Parliament for the province at the last election. Fears are felt that the Catholics, who are enormously in the majority in the rest of Ireland, will retaliate on local Protestents; but their leaders seem to possess great power over them and are using it to preserve a very politic peace. As the defeated party, they have a better excuse for turbulence.....

In the French Chamber of Deputies, the expulsion of the Princes was voted by a large majority yesterday. The "chief pretenders" are to be expelled at once: and it is left to the Government's discretion to exile at any time any other obnoxious members of the Orleans and Bonaparte families. The bill will go to the Senate Thursday, and will probably be passed by June 22, so we may have the royal and imperial aspirants to the French throne here before long. Having made an inglorious peace with Madagascar, and a not very honorable one with China, France is now seeking an extension of territory by seizing upon some islands in the Pacific; but England and Germany are watching her movements closely there. Labor troubles temporarily quieted: strikers resuming work.

King Ludwig II of Bavaria, whose crazy vagaries and crack-brained extravagance have for years been the shame and distress of his people, and the wonder and amusement of the rest of the world, was deposed on Wednesday by his Uncle Prince Luitpold, who has proclaimed himself Regent. Army, Court and people consent. King, locked up in one of his multitudinous palaces, refuses to surrender. Will be allowed his past income, and all the honors, but none of the powers of a king. He is 41 and unmarried; his uncle 64, married and the father of eight children.....

AGRICULTURAL NEWS.

SATURDAY, June 12, 1886.

IN 1884 there were 37,334,000 sheep in New South Wales, but owing to the drought of that year the number was reduced to 31,660,-321. The current year it is thought will show an increase.....Importations of foreign wools into Boston since Jan. 1 have increased over 100 per cent.; receipts of domestic wool have fallen off over 21 per cent....Texas wool is said to have improved so much of late years as to be equal to Australian, and Texan wool growers are advised to hold on to their wool for good prices. The wool growers of Eastern Ohio have "resolved" that 35 cents is a fair price for their wool, and have, therefore, fixed that price for the present clip..... The entire fruit crop of California is expected to bring to that State an aggregate of $100,-000,000!.....American corn is delivered in England at 60 cents per bushel!.....There are now in the U. S. about 20,000 flouring mills with a yearly capacity of 500,000,000 barrels—nearly seven times the requirements of home and foreign demands.....Recent public sales of Short-horns in England have ranged from $80 to $160 per head..... ..A disease like the "black rot" of the sweet potato is playing havoc with Irish potatoes in Southern N. J., Eastern Del., and the "river line" counties of Pennsylvania—attributed to wet weather.....California expects the largest grape crop in her history. Gov. Stoneman, Thursday, telegraphed Sec. Manning urging him and the whole Administration as well as the California Senators and Representatives, to aid the passage of the "wine bills" now before Congress, as the proposed remedial legislation is of paramount importance to the greatest interest of the State..... ....

Crops & Markets.

SATURDAY, June 12, 1886.

The weather in the United Kingdom has of late been favorable to grain crops, hence prices have been very low. Flour fell 12 cents per barrel this week. British importers are buying nothing beyond enough to fill immediate demands. Latest cables say the wheat harvests in South America, India and Australia are "up to anticipations." A short time back the anticipations portended short crops. Do the cablegrams mean they are not short? Very heavy imports of Indian corn of late into England and the Continent. On Friday, wheat in London fell 1¼ to 3 cents a bushel, and Indian corn ¾ to 1½ cent.

THE June crop report of the Dep. of Agriculture, a summary of which was telegraphed from Washington yesterday, makes the area of spring wheat nearly the same as last year—about 12,000,000 acres. There is an increase of one-sixth of last year's breadth in

Dakota, a decrease in Nebraska, and a small reduction in Minnesota and Wisconsin. The minor spring wheat districts show a small advance. The extension of area in Dakota is due mainly to settlement and the necessity of ready money for improvements and somewhat to last year's unsatisfactory flax product in Southern Dakota. The effect of low prices of wheat has been counteracted by the superior rate of yield of recent years. The condition of spring wheat averages 98½ against 97 in June of last year; Wisconsin 97; Minnesota, 99; Iowa 100; Nebraska 97; Dakota 99; Washington 100. Winter wheat is not quite so promising as on the first of May. A slight decline in condition is reported in the West, and the low condition of the Southern crop is still more reduced. Yet the average is only reduced two points, from 94.9 to 97.9. It is still from average to high in the great wheat-producing States. In New York it is not tillering as in 10 years of strong root growth. It is very promising in Maryland and Virginia, except in wet lands. In the South it has been affected with rust, shriveling the grain harvested. There have been injury from drought in Texas, rains and floods in Ohio, and hail-storms in Missouri. The prospect is good for a small fraction above 12 bushels per acre. Rye has also declined from a general average of 95.7 to 94.4 during the last month. The barley acreage has been increased three per cent, and condition averages 100; last year in June, 89. The large acreage of oats in 1885 has not been extensively increased. It has been slightly reduced in Kentucky and Ohio, where the area was abnormal last year. The increase will approach half a million acres. Condition averages nearly 96, against 94 in 1885, and 98 in 1884. It is the highest east of the Alleghenies, and a little below full condition in the South and West. The increase will approach half a million acres. Condition averages 96 against 94 in 1885. The tendency to increase the area of cotton has been checked in the eastern States of the cotton belt. The net increase is about 250,000 acres, an advance of 1⅓ per cent. The record stands: Virginia, 99; North Carolina, 100; South Carolina 99; Georgia, 98; Florida, 103; Alabama, 99; Mississippi, 102; Louisianna, 105; Texas, 107; Arkansas, 102; Tennessee, 101.

A telegram from Indianapolis says reports from every county in Indiana, Illinois and Ohio, which have just been received and compared, show that in the last 30 days the wheat crop has been seriously damaged by severe storms, but that the condition is 27 per cent. better than at the same date last year.

Reports of local rains and droughts in the Northwest; but a great tendency to cry "wolf." Frosts have done some damage in the Red River Valley, but mostly to vegetables. It is generally believed the reports are being garbled or concocted to serve the ends of speculators.

This month is of great importance to the growing grain and crop reports, and rumors have flown thick and fast through the newspapers and across the floors of the exchanges. We have had damage done by the chinch-bugs, by the Hesian fly and other pests, by drought in some sections and cold and excessive rains in others. But there is thus far no good reason for believing that material damage has been done. The Agricultural Dep't's report looks slightly unfavorable as compared with that for May 1st, but since its preparation a much needed rain has been reported at the Northwest.

The cotton crop is progressing finely in Louisiana, Mississippi and Texas. Heavy rains in the Carolinas and Georgia foreshadow trouble from grass. Burley leaf tobacco is strong at Louisville in the face of heavy receipts, while lugs are fractionally higher. The weather favors planting. Heavier sugar supplies, and better beet-crop prospects further depress sugar prices.

The wheat boom started last week in Chicago has collapsed and wheat has dropped everywhere a trifle more than it advanced last week. This has been due to the persistent refusal of exporters to buy at the advanced figure, and the favorable prospects of the new crop, backed by large stocks in sight and fair receipts, so that here No. 2 Red has fallen four cents during the week. Of all large markets the advance and fall have been smallest at St. Louis.

Corn has sympathized with wheat, and been further weakened by an increase of over 1,000,000 bushels in the visible supply. Oats have been firmer—an increase of only 250,000 bushels in the visible supply. Butter has slightly advanced—mainly, it is thought, through speculation. A good deal is going into cold storage to await better prices. Cheese has been advanced, owing to a fair export demand and moderate receipts; but exporters won't buy at the advance, so it is hardly likely to hold.

The excellent tone lately reported here continues in the principal wool markets. Manufacturers are buying freely for present needs, though few are stocking up. The ruling figures at Boston and Philadelphia—the chief wool markets—are considered low in view of the prices asked in the interior. Texas wool has already been pretty well all bought, as there has been a keen competition for the clip between dealers, agents of Eastern factories, and speculators. In Ohio, farmers are demanding, and in some places getting, relatively higher prices than those now ruling at the coast. The London sales, which begin on Wednesday, will settle the question whether the better tone abroad of late was due to the general improvement in trade or to temporary causes. In Boston the market is very firm, but has not noticeably advanced. The sales of the week are reported at 2,532,000 pounds, as against 2,435,700 pounds last week, and 1,891,000 pounds in the corresponding week last year. The current quotations for leading sorts there are as follows:

BEEVES.—Pennsylvania Meal fed Steers, 1,442 lb, at $6 16; do, 1,472 lb, at $6; Ohio 1,130 lb, at $5 85; Still Bulls, 1,226 lb, at $4. Ohio Dry Cows, 1,075 lb, at $3 92½; Pennsylvania do, 740 lb, at $3 50; Colorado steers (Corn-fed), 1,220, lb, at $5 45; Chicago Natives, 1,228 lb, at $5 71; Kentucky steers, 1,435 lb, at $5 60; do, 1,199 lb, $5 25; Pennsylvania steers, 1,400 lb, at $6 25; Oxen, 1,430 lb, at $5; stags, 1,660 lb, at $5 12½; Pennsylvania Cows, 970 lb, at $3 75; Indiana do, 1,057 lb, at $3 57; Chicago steers, 1,216 lb, at $5 50; do, 1,025 at $4 70; Stags, 1,710 lb, at $4 40; Oxen, 1,760 lb, at $4 25; Kentucky "Stillers" 1,012 lb, at $3 40; do, 882 lb, at $4 85; stags, 1,162 lb, at $4 50; Oxen and stags, 1,363 lb, at $5 30; oxen, 1,231 lb, at $4 95; Indiana Steers, 1,151 lb, at $5, Cincinnati "Stillers," 1,308 lb, at $6 05; Corn fed Chicago steers, 1,275 lb, at $5 60; do, 1,095 lb, at $5 50.

CALVES.—Buttermilk calves at 3½c. per lb; Fed do. at 4¼@4¾c; and Common to Extra Veals, at 4@6¼c.; Veals, 146 lb, at 5½c; do, 160 lb, at $5 75. Fed Calves, 178 lb, 4½c; Veals, 191 lb, at 5c; Buttermilk Calves, 166 lb at 3½c.; Veals, 152 lb, 6c.

SHEEP AND LAMBS.—Total for six days, 42,512 head against 31,591 head for the same time last week. Demand limited, and a very light business was transacted. Good Lambs were fairly sustained in prices, but sheep were drooping and Common Stock not wanted. Poor to Good Sheep sold at 2@5c; Common to Prime Lambs, at 6@8c, and a little bunch of Jerseys brought 9c; Prime Dressed Mutton sold up to 9½c, and Dressed Lambs as high as 14c, but Common Stock sold at low figures and the hooks was cleared with difficulty; Ohio Sheep, 96 lb, at 5c; Virginia Lambs, 60 lb, 8c; Kentucky Lambs, 62 lb, 7½c; Virginia Lambs, 65 lb, at 8c; Kentucky Sheep, 103 lb, at 4½c; Virginia lambs, 54 lb 7c; Virginia Ewes, 81 lb, at 4c; Bucks, 90 lb, at $3; Jersey Lambs, 63 lb, at 9c.

HOGS.—Total receipts for six days, 37,371 head against 36,041 head for the same time last week. None for sale alive. Nominally quotations at $4 50@4 80.

I WILL INSURE YOUR HOGS!

DR. JOS. HAAS'

HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]

Is the only Practical Preventive of the so-called Swine Plague.

It has never been surpassed as an increaser of pork and general system tonic. Aiding digestion, stimulating the biliary organs, preventing torpor and engorgement of the liver, and regulating the bowels, it removes and prevents the formation of disease germs, and preserves to the well bred hog his natural constitution. Where it has been fed to such animals in the prescribed quantities, and other directions faithfully observed, it has proved a thorough preventive against swine disease.

AS AN EVIDENCE OF FAITH

In my remedy I make the following offer:

I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and are neither in-bred, close-bred nor the progeny of such.

1. I will forfeit $100.00 to any breeder whose offer to examine for insurance I decline, provided he forwards remittance to cover my expenses to and from location of hogs, or I fail to prove to the satisfaction of any disinterested party, that failure to respond to invitation is caused by prior engagement or by matters of at least equal importance.

2. I will forfeit $500.00 if I decline upon examination to insure such herds, if my judgment as to their condition of health is overborne by the result of an examination made by at least two properly qualified and graduated veterinary surgeons.

Facts are Better than Assertions.

Please read the following testimony:

GIBSONTON P. O., PA., Feb. 2, 1885.

Dr. Jos. Haas—Dear Sir: About a year ago our herd here numbered about 2,700 head. Disease broke out, and no remedy we had would arrest the trouble. Our losses were heavy and we had to give up feeding entirely for about two months. We then heard of your remedy and bought a trial lot, and began feeding again. We have used it constantly ever since. We have since April last received about 5,000 head of hogs into our herd and have not had a single death from swine disease. This is our experience. Our opinion is that the remedy has prevented disease, and we would not think of being without it. As an aid in fattening pork, we believe it to be good. On this point, however, we have not made an actual test, *as we would not risk feeding a pen of hogs without the Remedy.*

Yours very truly, WHITE & CO.

[N. B.—White & Co., since writing the above letter, have purchased $450 worth of the remedy.]

The remedy can be procured of all Druggists, or from my laboratory. Prices, $2.50, $1.25 and 50 cts. per package. 25 lb. cans, $12.50.

CARTER'S

IMPROVED NEEDLE HAY KNIFE.

This knife has been tested with the most celebrated knives of other makers, and has proved an easier and faster cutter than any other. Its special excellence consists in a chisel edge tooth. It may be used for cutting hay in the mow, stack and bale; also for ditching, cutting peat, or for any other work for which a hay knife is used.

For the Young.

MAY making time is almost here. No doubt some of the Cousins have already had a taste of the work. We shall all be at it before long. Boys can do far more work in the hayfield then they could when I was a boy. I know boys who can drive the mowing machine or the horse-rake just as well as a man can. Girls can do the work too. It is wonderful, isn't it, how by the aid of machinery, a boy's muscle becomes as powerful as his father's? It is very much the same way with the brain. Some people seem to have wheels and levers inside their heads, so that every thought is made three times as strong as it otherwise would be. These wheels and levers come from thinking and study; they never can come in any other way.

Years ago, about the only thing a boy could do in the hay-field was to spread the swaths and rake the hay into windrows. I had my full share of that work. Somehow they used to give the boy the worst tools on the farm. I wonder if that is so now? If there was any broken pitchfork or rake, why the boy was expected to take it. It would have been well enough if it was understood that these poor tools meant less and poorer work, but that was never thought of. They always looked out that the boy had enough to do, and if he didn't keep up there was a great commotion. The sharp grass used to prick my feet, and sometimes they got pretty sore, but of course it never would do to wear the "new shoes" out in the field. It used to seem to me that my shoes were always "new" as long as they could hold together. When the mowers sat under the trees to "cool off" the boy was always sent after a jug of water—while he was "resting." One day I had a good rest. The mowers cut into a bumble-bee's nest. The bees chased them so hard that they ran and hid under the hay-cocks. I sat under the trees and waited till they could get to work again.

Another work that was always given to the boy was "mowing away." I have done all kinds of hay work, but to my mind there is nothing harder than treading hay in a hot, dusty mow. I have known two great, strong men to pitch hay at me that they knew I never could handle. How they would laugh when they had me "buried up." Instead of coming up to help me handle the hay, they would lean on their pitchforks and tell me I wasn't half as smart as the boy on the next farm. They used to tell me that such work would make a boy tough. I am inclined to think it will, but there is such a thing as being altogether too tough. If I wanted to make a little old man I would treat a boy just in that way. A boy that will work right on without noticing when a bird flies over the field or a rabbit runs into the woods, is not a boy at all, and he never will be one. He will just work, work until his muscles give out—and then what a blank the rest of his life will be.

Now, boys, I hope none of you are badly treated. Sometimes boys think they are having a dreadful time, when, in reality, there are plenty of people much worse off. All boys and girls ought to work; all who do not do something useful are drones. The majority of people prefer work to idleness. When work is made pleasant and boys are given to understand that they amount to something, they will make good farmers and good workmen. When they are crowded and driven and made to feel that they are nothing but "boys," they will grow up to hate farm work, and I for one don't blame them for doing it. I want my boys to stay on the farm and make farm life what it ought to be. I know well enough, though, that one good, satisfied farmer is worth a dozen men who have had their youth crushed out by hard work and constant fault finding. Don't get discouraged, boys. Have patience. Even if some of you have to work hard and feel that you are badly treated, keep cool. Never lose your idea of what a farmer's life ought to be. You will come out all right in the end.

The lists still come in. Time is up now though. I will try and get the counting done by next week if I can. I am beginning to feel sorry there is no Aunt Mark to help count. Lists have been received during the past week from Bertha S. Giddings; Ethel Drummond; Edith Pidd; E. R. Childs; Edu Seymour; Huttie Belle Hotchkiss; Anna Weaver; J. E. M. Valentine; Kittie E. Turner; David Falconer; Kittie M. Grossman; Lulu Hudson; Eleanor M. Burge; Stella P. Anthony; Lottie M. Tew; Maggie Brown; Nina A. Dodge; Laura Finda; Lynne C. Greenwood; Una Bowker; Johnnie Rightsell; Ivan C. Rex; John Dockstader; W. O. B. Cribbs. Alice M. Kell; L. R. Williams; Lillus Cox; Willie R. Fick; H. A. Clough; Ella J. Hallock; Henry Freyensee; Henry S. Moore Jr.; Mahlon Gross; Roscoe Ives; Homer L. Orr; Minnie Mattingly; Carrie M. Warner; Sarah J. Miller; Anna Emery; Olivia B. Sell; Edith M. Campbell; Katie E. Cook; Fred Douglass; Hugh M. Sherwood; Maggie Carter; Maggie Booth; Isaac I. Van Wie; Harry Camp; Mary M. Davies; Eddie M. Slack; Grace M. Putnam; Anna Greene; Alice E. Johns; Bessie Hope; George Lea; Alice McCarty; Bessie M. Snow; L. May Minep; Hattie S. Winship; Frank W. Clegg; Wallace H. Tarbell; Arthur L. Wright; Eva Hambleton; Abbie G. Burnham; Phoebe T. Ives; Edwin S. Parsons; Fannie Senter; Minnie C. Ansby; Charlie E. Pearce; Arthur Lewis; Mamie E. Laing; Gertrude Stough; Marion Walker; Maggie W. Butler; Warren L. Loop; Abbie Ward; Robert Brown; Luther Herriman; Jennie Hunt; Merwin T. Sudler; Elizabeth Ottaway; Ossie Sturdevant; Clark Gardner, and several that are unsigned.

NOTES FROM THE COUSINS.

DEAR UNCLE MARK: I am 13 years of age. My father is proprietor of the Osage City Nursery. He has about 6,000,000 evergreens, large and small. We planted about 100 bushels of soft maple seed this Spring. They are most of them up now. I go to the Osage public school. I study reading, writing, arithmetic, history, grammar and spelling.

Your nephew, CLARK GARDNER.

Osage, Iowa.

[I am glad you are planting trees. Too many people are cutting them down.—U. M.]

DEAR UNCLE MARK: We received the Garden Treasures. We planted them, and they came up nicely. There is one little geranium, one hollyhock and some phlox. We think very much of them. I have about 50 young chickens. I have two pet hens. Last Summer the old hen came off her nest with her chickens before we knew she was setting, and left two eggs in the nest. I took them and wrapped them up in a damp cloth. When they hatched the old hen was so wild that I could not put them with her, so I had to keep them. I would let them out in the yard in the day time. When they were about as large as partridges, they would come and fly up in our lap to be put to roost. We have three young pole-cats; they will stamp their feet at us sometimes. My brother caught them. Well, I guess I will close. Your niece, MINNIE MATTINGLY.

Muskingum Co., Ohio.

[That is a new way of hatching chickens. I guess they were already hatched, but that the egg-shells were too hard and dry for them to break alone. They must have been good pets. I think it would be safer to let those pole-cats go.—U. M.]

DEAR UNCLE MARK: Thank you, Uncle Mark, for printing my sister's letter. I wish you would come and help to eat strawberries with us. They are getting ripe. They are the largest I ever saw. Papa bought us a nice organ. I can chord some on it. My sister can play some on it. We have about 30 little chickens. Papa put the fish in the pond. It broke out since he put the fish in it.

Your niece, ANNA EMERY.

DEAR UNCLE MARK: I am a farmer's boy, living on a farm of 110 acres. We are plowing our ground for potatoes now. I am raising celery to sell. I have about 500 plants now of the White Plume and Boston Market. The plants are nearly two inches high, and I have transplanted them once into shallow boxes. I expect to make quite a good deal of money out of my celery this fall when I sell it. When I gather and sell it I will write you again. We have about 40 early lambs, averaging in weight about 40 pounds each

Yours truly, HOMER L. ORR.

UNCLE MARK: As Homer was so busy helping his father on the farm, he did not have much time. So I have helped him some about his words and letter.

HOMER'S SISTER.

[I hope you will make some money; still if you miss it, be ready to try again. Write us again about the celery.—U. M.]

HAZE.

(Concluded.)

THE engine had finished rubbing his tobacco by this time. He filled his pipe and brought a coal from the fire-place with which to light it. He glanced at me as the visitor asked his question. I pretended to be busy over the press. I will confess that I was anxious to learn about the dog. Not a very high ambition, perhaps, when the world was waiting for the paper to be printed, yet high or low there was something about the conversation that interested me, so I pretended to be busy and let the two talk on.

"I done killed dat dog dis mornin'. Dey wuz a mad dog done bite him, an' a white man say dat my dog ud go mad an' bite folks. So I done kill him do I hates mightily to do it."

The visitor began to show signs of alarm. He put his hat firmly on his head and looked nervously about to hunt up a line of retreat.

"Whar you reckin dat mad dog is now?" he asked earnestly. "Ef he aint been killed, pears like I wanter git home ter once an' see what de prospects is." He moved towards the door as he spoke, but the engine's next sentence gave him considerable comfort.

"I reckin he's dead sho' nuff. Dey waz a white man kill him. I'd like mightily to do it myself. Jes arter sun up the mad dog he come snuffin' roun' snappin' jus like he wanted ter tar things all to pieces. My little boy he playing out in the yard, an' fus you know, dat mad dog he run an' snap jes like he gonter tar de boy all ter rags. De boy he yell po'ful, but my dog—old Haze I calls him—he jes jump up frum whar he laid by de do', an' he tackle that mad dog like fo all he's worf. Den dey fite po'ful an' old Haze he drive de mad dog away. Den after while he pear like he mightily shuck up. He come back to de do' an' lay down an' den I see dat he's bit mighty bad. Dey waz a white man come an' say dat he go mad jes like de mad dog done. He say dat when folks goes mad dey is terrible. So I kills old Haze an' we had de buryin' dis evening."

The visitor was all sympathy. He rubbed his head as if trying to think of some consoling remark. He was forced to resort to the common practice of praising the dead.

"Dat was a po'ful good dog at wuz. 'Pears like he wuz de boss dog ob de hull place. I neber see no dog dat cud whip him. I reck'n he'd wear out all the dogs dey is."

The engine began to warm up at this praise.

"You'se mighty right, you is. Ole Haze he done beat 'em all. A bull-tarrer he wuz; his teef dey wuz sharp ez knives. You jes orter see him fite. Dey want no yard full ob dogs dat cud make him run. He wuz one of dese yer snappin' dogs, he wuz. He set down and fite, he do. When he git a holt he jes shet his eyes an' say nuffin. De fus time dat I eber knowed him ter jump up an' fite wuz dis mornin' when he fit dat mad dog. I reckin dat wuz kase de mad dog he gonter bite my boy an' ole Haze he see dat sumfin got ter be done mighty quick. He neber hurt nobody when dey let him alone. He'd jes set by de do' an' watch like he had a heap ob money inside. 'Pears like dey want no dog like him."

The visitor screwed his face into a doleful expression that doubtless did the engine much good.

"It am po'ful curus how it is dat de bes an' de braves' has ter be tuck away when deys allus a heap ob shucks layin' round lose like. 'Pears to me deys a po'ful fine lesson in dis yer bery succumstance. Yer is a heap of dogs dat ain't worf shucks; dey all gits off—clar off when dey ain't no danger sho' nuff. But dis yer dog ob yo's, de bosses ob all de boss dogs, jes bekuse he stan' up fo' de rights ob de human family, he done git killed. I reckin deys a heap ob men—white men, too, I reckin—dat don't do no braver act dan yo' dog done. He jes gib up his life fo' his fren'—dat what he done, an' I reckin dey ain't many folks dats gonter do mo' dan dat. 'Pears like its jes de same way wid folks. Now here I is, an' dere you is, an' yers dis nun yer an' dat nun yar. Who is guinter be taken an' shuck up wid fiar? De shucks an' de nubbins? Its jes as like ez not dat de fus you knows you an' I is gonter be ketched up an' all dese yer low down folks is gonter stay an' hab de fun."

The conversation had drifted so far from the original subject that I felt justified in bringing it to a close. The engine was evidently anxious to have it continued, yet at a sign from me he took hold of the wheel and resumed operation. In the rattle of the press the visitor found that the effect of his sentences was lost. He left us to go and comfort some other sorrowing person.

The next day the engine came to me with a board which he had rudely carved into something of the shape of a gravestone.

"Boss," he said, "I reckin I'd like ter git you ter sorter write dat dog's name on dis yer bo'd. 'Pears like I'd like ter know whar he is buried at."

I wrote the name "Haze" in large letters on the rude board. What though he was only a "nigger's dog," he did not live in vain. He gave "his life for his friend."

WHAT SCIENCE SAYS.

The "Fearful and Wonderful" Mechanism of the Human System Graphically Portrayed.

[In the editorial columns of the New York *Analyst*, H. Lassing, M. D., editor, writes the following beautiful description of the laboratories of the human system. We think we have never read a finer or more trustworthy one.]

"Man is the greatest of all chemical laboratories. Magnify the smallest cell of the body and what a factory is spread before the eyes—countless chambers in which are globes of air, masses of solid matter, globules of dying liquid! A flash comes and the whole is consumed and needful heat is carried into every part of the system. Electrical forces also generate and are conveyed to the brain, the muscles and the various nerve centers.

"In another set of a million chambers we see various gases and vapors. By chemical action these are changed and purified in the lungs and the skin. The blood, we often say, is a great living river. In its current are masses which the air in the lungs did not affect: blocks of chalk; slabs of tartar; pieces of bone-ash; strings of albumen; drops of molasses, and lines of alcohol. How are these waste masses disposed of? Begin where you will in this great stream you must come to the purifying places of the system. Here all is activity, and an invisible force reaches out into the stream, siezes and carries this mass of waste into vast trenches, thence into a smaller reservoir, and finally into a larger reservoir, which regularly discharges its contents.

"This separation of lime, uric acid and other waste material from the blood, without robbing it of a particle of the life fluid, passes human comprehension. In health this blood-purifying process is carried on without our knowledge. The organs in which it is done are faithful servants whose work is silent as long as health remains.

"People strangely wait until pain strikes a nerve before they realize that they have any trouble. They do not know that pain concerns chiefly the exterior, not the interior, of the body. A certain set of nerves connect these blood-purifying organs with the brain. They may not gnaw and bite as does the toothache or a scratch, but they regularly, silently report. When these organs are failing these nerves indicate it by drawing the blood from the face and cheek, leaving the lip and eye blanched, by sending uric acid poison into the smallest veins, the skin then becoming gray, yellow or brown. They also prevent the purification of the blood in the lungs and cause pulmonary difficulties, weariness and pain. Who enjoys perfect health, especially in this land where we burn the candle in one mass? The athlete breaks down in the race; the editor falls at his desk; the merchant succumbs in his counting-room. These events should not have been unexpected, for nature, long ago, hung out her "lanterns of alarm." When the "accident" finally comes, its fatal effect is seen in a hundred forms: either as congestion, chronic weakness, as wrong action, as variable appetite, as head troubles, as palpitation and irregularities of the heart, as premature decay, as dryness and harshness of the skin causing the hair to drop out or turn gray, as apoplexy, as paralysis, as general debility, blood poisoning, etc.

"Put no faith then in the wiseacre who says there is no danger as long as there is no pain. Put no faith in the physician, whoever he may be, who says it is a mere cold or a slight indisposition. He knows little, if any, more than you do about it. He can neither see nor examine these organs, and depends entirely upon experimental tests, that you can make as well as he.

"If the output is discolored or muddy; if it contains albumen, lymph, crystals, sweet or morbid matter; is red with escaped blood, or roily with gravel, mucus and froth, something is wrong and disease and death are not far away.

"These organs, which we have described thus at length, because they are really the most important ones in the human system, the ones in which a large majority of human ailments originate and are sustained, are the kidneys. They have not been much discussed in public because it is conceded that the profession has little known power over them. What is wanted for such organs is a simple medicine which can do no harm to the most delicate, but must be of the greatest benefit to the afflicted. Such a remedy, tried and proved by many thousands all over the world, is Warner's safe cure. With those in whom disease is deep seated it is the only specific. For those in whom the seeds are sown and the beginning of illness started it is an unfailing reliance. It may be recommended to the well to prevent sickness and the sick to prevent death. With its aid the great filtering engines of the system keep on in their silent work without interruption; without it they get out of gear and then disease and death open the door and cross the threshold."

Such writing ought not only to please but to carry conviction that what Editor Lassing, M. D.—so high an authority—says is true, and that his counsel is worthy the attention and heed of all prudent, right-minded people.

PERSONALS.

JUDGE FULLERTON, of this city, is confident the Government will have to pay the Confederate bonds "in time;" "in eternity" all others think.

SENATOR ALDRICH, until a short time ago "an unknown young man of simple mercantile training," has been re-elected to the United States Senate by the Legislature of Little Rhody.

THE marriage of Judge Stanley Matthews to Mrs. Mary K. Theaker will take place here June 23, and on the same day the happy couple will sail for Europe to remain there till October.

SAID Cleveland to a Cabinet officer just before the event: "Things will be a good deal changed about here, no doubt." Democratic office-seekers hope so, and some even expect a change.

SEC. MANNING, the "brains" of the Cabinet, has resigned; but the President wants him to take a holiday for his health till October, and will not accept his resignation, if he is in good condition then. The resignation will probably be accepted.

THE wedding would have been in the Fall were it not that the engagement had leaked out, and made life a burden to both. He proposed to be married in New York, she preferred to be the first woman married to a President in the White House.

LAST Saturday a large part of the country was startled by the announcement that Henry Ward Beecher had dropped dead suddenly. He is still bright and active, however, never better in his life, and has planned to deliver 40 lectures during a European tour on which he is to start next week.

MISS ROSE ELIZABETH CLEVELAND has purchased the old homestead at Holland Patent, N. Y., and fixed it up "with excellent taste" and is going to live there. The publishers of her book say that up to May 1, she had received from it $12,000, and the steady sale of it is bringing her in from $25 to $100 a month. It has got lots of free advertising.

"HONEST JOHN KELLY," who was buried last Saturday, left all his money—over $400,000—to his wife, making her sole executrix. She will do the right thing with their two children and the charitable institutions which expected something. At 21 he had nothing but good health, a strong body, a resolute mind, no education, but good natural abilities.

SEC. GARLAND was the only member of the Cabinet who did not attend the President's wedding. At the death of his wife, 10 years ago, he vowed he would never enter into social festivities again. He has kept his vow, and did not attend even the wedding of his son a year ago, though he married with his father's full approbation. Devotes all his time to office work and the care of his aged mother.

REV. DR. SUNDERLAND got a brand-new $100 bill for performing that little ceremony at Washington, and straightway handed it to Mrs. S., who will keep it as a memento. The Doctor omitted the word "obey" from the pledge of the bride, not using the Episcopal form, but a brand-new one invented by himself. For the groom his words were: "love her, cherish her, comfort and keep her;" for the bride: "love him, honor, comfort and keep him."

IN the little Holstein village of Segeberg there lives a humble shoemaker named Honelach, who has collected 2,563 different kinds of beetles—1,390 native and 1,173 foreign. They are all scientifically arranged and classified, and the collection is exceedingly valuable from a scientific point of view. Although his years are 80, Honelach is still an enthusiastic student of beetles, and probably knows more about these insects than any man living.

GRAND MASTER WORKMAN POWDERLY offered to resign at the Cleveland Convention, believing it wasn't in harmony with his views. The convention refused to accept his resignation and offered to double his salary, making it $3,000, instead of $1,500 a year. He was induced to keep his place, but absolutely refused the offered increase of salary. He says the telegraph operators at Cleveland were instructed by Jay Gould to exaggerate the disagreement in the convention, for the purpose of hurting the Order.

CONTROLLER CHAPIN, of this State, has decided to pay, without the deduction of a cent, ex-Senator Conkling's bill of $20,000 for the work he did in discovering the Aldermanic bribery here. He says Conkling declined work that would have brought him over $20,000 to give all his attention to the case "which he conducted with great ability." Chapin is noted for slashing bills. Conkling makes, it is said, about $100,000 a year; as U. S. Senator his salary was $5,000. Clarence A. Seward, another of the consel, wants $21,000. The whole bill amounts to $48,000—$6,000 for stenographers and printing the testimony.

FOR THE HARVEST,

Which will soon be upon us, we offer to our FARMERS the following special TOOLS and MACHINES of our latest and most approved pattern:

The CROWN MOWER,
The MONITOR Hay Rake,
The Burdick Hay Tedder,
Our Improved Hay Loader,

with the largest assortment of small TOOLS and MACHINES for the Hay and Grain Fields to be found in this Country.

Send for descriptive circulars of the above modern Implements as well as any and every requisite in the line of Tools, Fertilizers and Seeds.

A visit of inspection is invited to our extensive warehouses at **189 and 191 Water Street.**

Entered at the Post-office at New York City, N. Y. as second-class mail matter.

Humorous.

A MARRIAGE ceremony is very much like a street-car strike. It's nothing more nor less than a "tie-up."

IT is a sure sign that the fools are not all dead, when a fat man tries to be a dude and wear tight pantaloons.

NOW that the funnyisms of Lord High Executioner in "The Mikado" are becoming stale don't style them chestnuts. Call 'em Ko-ko-nuts.

WHAT must we do to be saved?" asked a Sunday School teacher of her pupil. "Git lost," was the very suggestive, but incorrect reply.

FIRST small boy—"Say, Johnnie, where are you in Sunday-school?" Second small boy—"Oh, we're in the middle of original sin." First small boy—"That ain't much; we're past redemption."

A YOUNG gentleman asks the editor to tell him which is proper for him to say on leaving a young lady friend after a late call. Answer: Either is proper; but always speak the truth, even if you have to say good morning.

THE young lady having asked her S. S. class what lesson was taught us by the parable of the wise and foolish virgins, one of the smallest girls answered: That we should always be on the lookout for a bridegroom.

"YOU say the trout weighed ten pounds?" "Yes, sir; it was the biggest trout I ever saw." "And he got away from you?" "Yes." "Will you take an oath to that?" "I'll take no more oaths; I swore enough about it when he got away."

"I'D like you to help me a little," said a vagrant, poking his head into a country shop. "Why don't you help yourself?" asked the proprietor. "Thank you, I will," said the tramp, picking up a bottle of pickles and two loaves of bread and then vanishing.

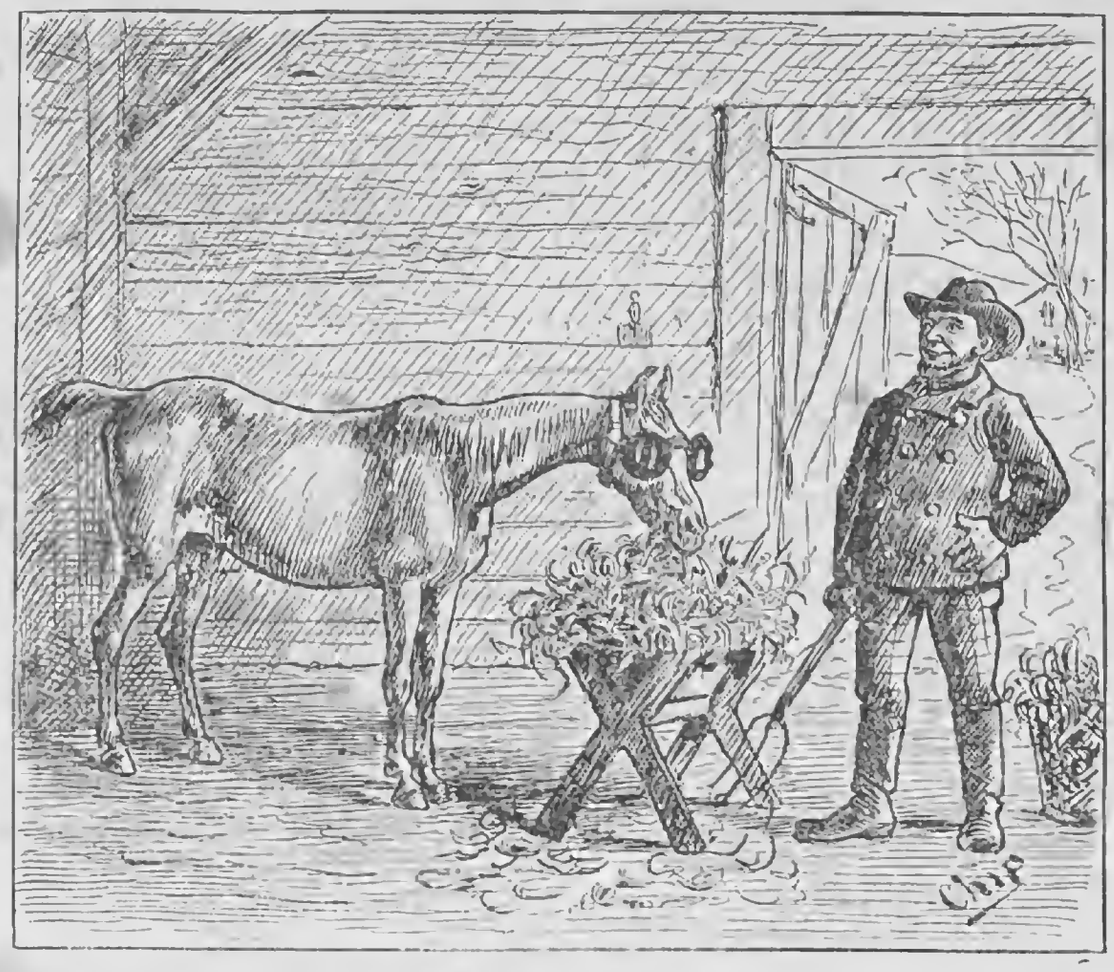
"I WONDER what Mr. Fogg meant to-day when I told him about our new grand piano?" said Miss Pedalpounder; "I asked him if he would come over to-night and hear me play, and he said, 'No, thank you; I'd like to see your graud farther.' Wonder why he is so much interested in grandpa?"

"BOBBY," said the minister at the dinner table, "what do you expect to be when you grow up?" "I'll be a minister, I think." "That's a laudable ambition, indeed, Bobby. Do you think you will like to be a minister?" "Oh, yes," Bobby replied. "Pa says you've got the softest job in town."

DOCTOR: "Your wife is in a very critical state, and I should recommend you to call in some specialist to consult on the case." Husband: "There, you see, doctor, I was right again! I told my wife long ago she ought to get proper medical advice; but she thought you would be offended."

A NEWLY married lady, not well posted about household matters, said to her grocer not long since: "I bought three or four hams here a couple of months ago, and they were very fine. Have you got any more of them?" Grocer—"Yes ma'am, there are 10 of those hams hanging up there." "Are you sure they are off the same pig?" "Yes, ma'am." "Then I'll take three of them."

A GOOD old deacon in Central Illinois who lost all his big drove of swine by hog cholera took the matter so lightly that his wife felt called upon to reproach him. "Deacon," said she, "I should think you would be ashamed of yourself. It looks to me as though it was a judgement sent on you by the Lord." "My dear," said the good old man, "if the Lord wants to take out his judgement in three-cent pork, into which I would have to be pouring good thirty-cent corn if they lived, let us not grumble."



CHEMISTRY OUTDONE.

Blue-glass spectacles turn shavings into hay. A hint to horse-owners.

The Herdsman.

MISERY AND COMFORT IN CALF FEEDING.

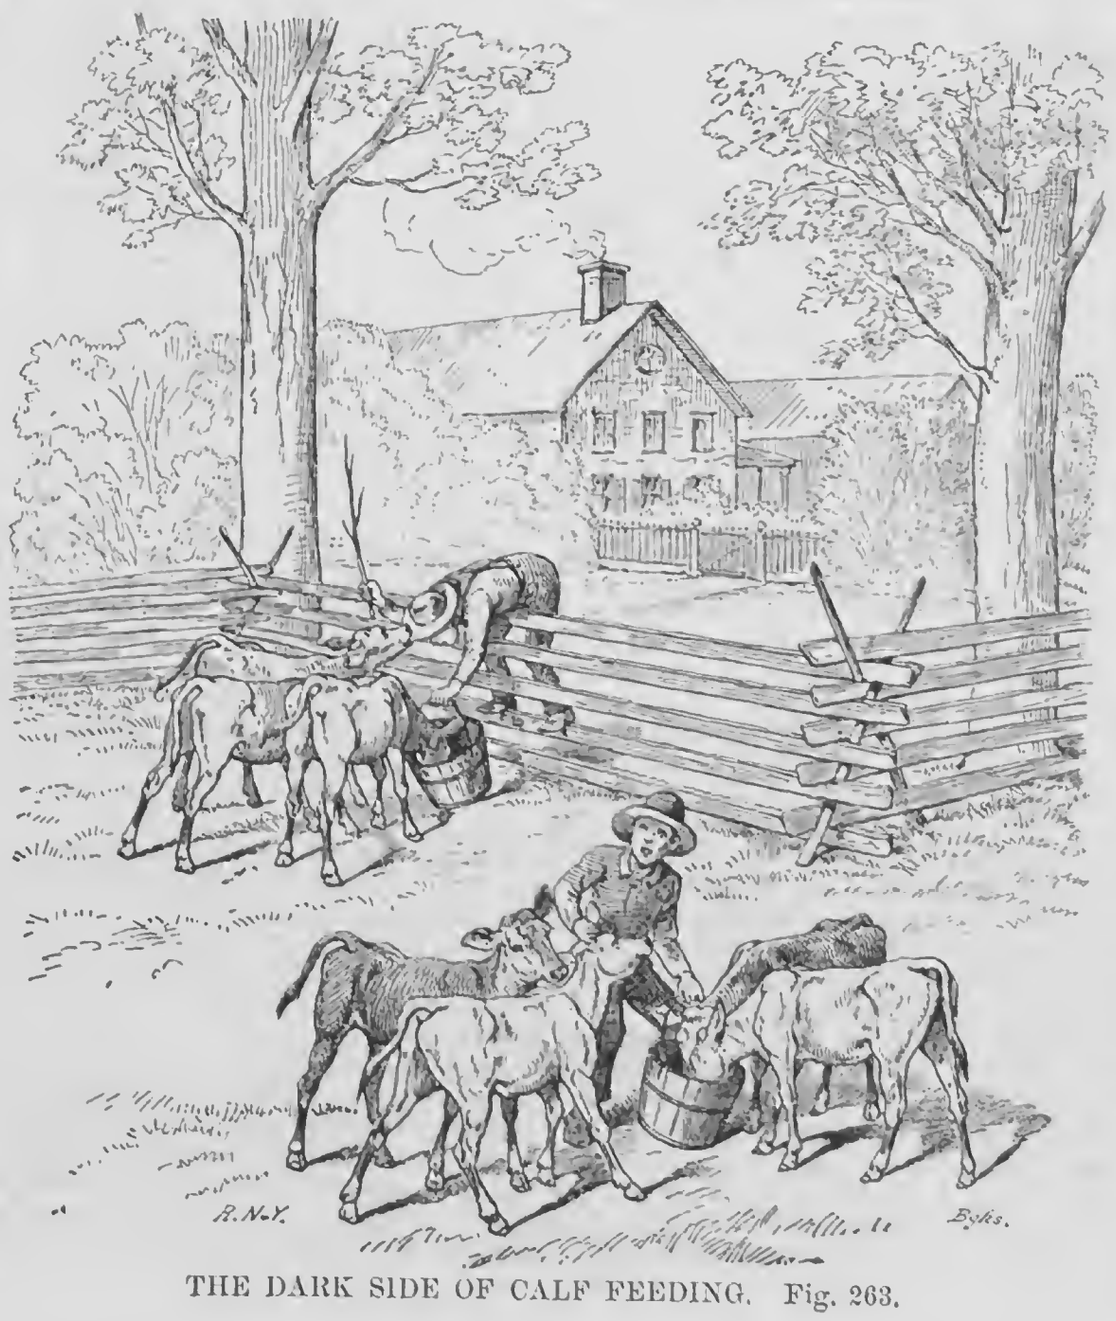
R. J. M. DREW, of Winona Co., Minn., sent us two drawings from which our artist has succeeded in illustrating the dark and the bright sides of calf feeding. Mr. Drew informs us that before the stanchions shown at Fig. 262 were built, the whole family had to turn out in order to feed the calves. Any man whose boyhood was passed on the farm will appreciate the little drama shown at Fig. 263. If there is anything that seems to be all stomach and no brain it is a hungry calf. The boy leaning over the fence is probably willing to confirm this statement. He has all he can do to balance himself upon the fence without plunging headlong into the pasture. The two calves bunting and pushing away at the pail keep his hand occupied, while the other tormentor, with genuine calf-wisdom, sucks away at his new hat, regardless of the blows from the stout switch. The other boy is no better off. He has carried the war into Africa to the extent of entering the pasture with his milk. Nothing but his slippery hold upon the calf's ear saves him from total annihilation. Once let his hand slip and his milk is gone forever. To make this system of calf feeding a success there should be several other boys armed with sticks to keep the extra calves away. Fig. 262 proves two things that have hitherto been considered doubtful: a boy can feed calves with a good deal of comfort and actually smile during the operation; and even a calf can be taught a small amount of common sense and respectability. The picture explains itself. You would hardly recognize the boy. He stands erect and satisfied. He feels that his hat is no longer in danger, and that his boots will not be filled with milk. These stanchions have transformed him from a fighting character into a statesman, showing the great superiority of brain power over brute force. The stanchions used by Mr. Drew are made of 16-foot fence boards. This space gives room for 10 calves. They may be secured to posts or trees, with a stout post in the middle. The upright pieces are three feet long, made of pieces of fencing split in halves. A row of such stanchions long enough to feed a dozen calves can be made in three hours, and nobody but the boy can understand how much patience, perspiration, and milk they will save. At first the calf will have to be pushed into the opening, but after finding that he can get his milk in no other way he will need little urging. The restraint will make a new calf out of him. He will be easier to break to the halter and will be gentler all his life to pay for this early training. After this, let us hear of no more tragedies at the calf pen.

COW TALK.

COL. F. D. CURTIS.

JUNE and July are the months when most of the cows are bred for the next year, so that the calves come in March and April. I have had early calves for years, and think it is better to have them in April and May. Breeders generally allow cows to be stinted the first time they are in heat after the calf is born. There are some good reasons for this, one of which is that the calves are soon weaned; but there is a loss in the vigor of the mother, unless it is made up by liberal feeding, which is usually the case. This very liberal feeding is a damage, for no animal does well on a long-continued stimulating diet. If for a breeder, a cow should have a rest; and if for the dairy, she requires a time for recuperation, but not the usual period of four or five months allotted to native cows. When cows come in, in cold weather, they must be tenderly cared for and liberally fed, or they will become miserably poor and dry up in their milk. To prevent this, they must be fed well, and this is expensive. Hence I have changed my past practice, and this year the cows are coming in after they have been turned to grass. They are fed before calving a little meal—two quarts at night—and have a little hay or straw to eat.

THE BRIGHT SIDE OF CALF FEEDING. Fig. 262.



THE DARK SIDE OF CALF FEEDING. Fig. 263.

Not a case of garget or any trouble with hard udders. When the cows came in in March, the udders were often swollen and so sore that they were milked with difficulty. There is a wonderful renewing, cooling and salutary virtue in grass; and when the cows are wholly or partially at grass, is the safest and best time for the calves to come. In cold weather the cows must be watched at night; and this is always a disagreeable job for the owner and exceedingly against the notions of the modern hired man, who is averse to doing any more than he is obliged to, and whose idea of duty is to work short hours and few of them. The farmer, then, who would have his cows in the most profitable condition when Summer comes, and save himself a great deal of trouble, will arrange to have his cows in milk with the starting of the grass. When they come in later, they will hold on in milking later in the Winter.

Sheep Husbandry.

Notes from the Western New York Farm.

SCAB REMEDIES—INEXCUSABLE IGNORANCE.

"As soon after shearing as possible cure the scab in your flocks. Tobacco and sulphur is a sure remedy and helps the sheep in various ways. It stimulates the growth of the wool, kills the ticks and lice also. If swallowed in small quantities it can be recommended for the same reason that Paul advised the use of wine, viz: for the stomach's sake and often infirmities. It rids them of worms and sich like."

The above, cut from The Sheep-Breeder and Wool Journal, Chicago, fairly illustrates the gross ignorance still existing on the subject of animal medication: it is also a specimen of the twaddle ignorant or careless editors allow to lumber up the pages of the farm reports, to the disappointment and even injury of the confiding reader.

"As soon after shearing as possible cure the scab," teaching by inference that at other times it may be allowed to run. What nonsense! Why, scab is a terrible scourge in a flock, and the breeder must remember that whenever its presence is discovered, not a moment is to be lost in separating every affected sheep from the flock, and no matter how slight the attack, they must be cured or killed at once, and the unaffected sheep should be also immediately put into clean quarters, and the old ones cleansed by a strong lime or potash wash, charged with carbolic acid, otherwise the scab spreads rapidly through the flock which is rendered practically worthless.

The use of tobacco and sulphur as a remedy, is old and laid down in many old authorities as a specific; but it is on a par with bleeding, blistering and the use of blue mass in human medication, and by no means a sure cure. We have now much better and surer agents, and he who is not posted in their use is out of place in the editorial chair of a sheep-breeders' journal.

That tobacco or sulphur can be used either externally or internally so as to be stimulating to the growth of wool is an utter humbug; and that tobacco, when swallowed in any quantity, however small, is anything but a poison and as such only harmful, all should know, and no one having a desire to benefit the sheep industry would dare to deny. That tobacco will kill the scab insect as well as ticks, etc., I admit; but it only kills when in actual contact, and as it possesses no penetrative power, when applied for the scab it only kills those insects which by rubbing or some other means are brought to the surface, and unless repeatedly applied, it is no cure, only a

palliative. I seriously doubt whether any flock was ever entirely cured of the scab by its use. And again, its proper application requires steeping kettles, dipping vats or tubs and drainage pens or tables, and is, in every way, a costly, slow, nasty and disagreeable "job." There are many remedies much preferable to this, namely, Little's or Lawford's sheep dips. Though perhaps costing more than the tobacco and sulphur, their efficacy depends upon the penetrating and cleansing properties of coal tar and its extracts, and they are sure cures.

There is still another remedy which should be most widely known. It is plentiful and cheap, and, when its virtues are known and it is called for, it will be obtainable in every region where sheep are kept. I allude to

CRUDE PETROLEUM.

It can now be had at most drug stores, and is a sure destroyer, not only of the scab, but of every other insect that infests domestic animals. It also cures all classes of skin diseases as well. Ordinary "coal oil" or kerosene, such as is used for lighting our houses, will kill, though not quite as surely or quickly, but it has the grave objection of blistering and taking off the wool or hair. This is not the case with the crude oil. It may be freely applied by a brush or "swab," or may be poured from a can having a small spout, and if the sores be rubbed so as to break up all "scabs," it will penetrate to the remotest depths, and not an insect will survive its deadly influence, and if applied to the most delicate skin it has only a beneficial effect. On the Western New York Farm it is always kept in quantity, and applied freely to any animal infested with lice, scab, or mange, and also to the interior of the hen-houses. It is also used as a lotion in case of wounds or scalds on man or beast; nothing can be better. It is time that agricultural writers and the press should make its virtues more extensively known, and no longer recommend the use of such a nasty, poisonous, and, withal, uncertain a medicine as tobacco.

Clover meadows are beginning to show "their colors." Thus far there is no appearance of the midge. It *looks* good to see them once more as bright as a bed of roses, and it will *seem* good if we can once more grow our own clover seed; yet I very much doubt whether it will pay me to grow any for market at present prices of seed and hay. I cut all my meadows twice and some of them three times, getting at each cutting a good crop of hay, and the extra hay is of nearly or quite as much value for feed as the money the seed would sell for in the market, and then the crop is not nearly so hard on the land as when fed, nearly all the abstracted fertility goes back.

I shall, however, if the midge does not put in an appearance later, raise what seed I want for my own seeding. I pride myself on having clean fields, and weed my farm over twice each year, and when I raise my own seed I know just what I am getting. This is never the case when I buy seed.

Western New York farmers are meeting much loss and are greatly annoyed by finding, after planting, that their seed corn was bad. Thousands of acres have been planted the second time, making it quite late, besides the extra expense. Last Fall was very rainy and with but little sunshine, and corn, even when husked and cribbed early, scarcely seasoned at all before cold weather. The result of freezing in this condition was the destruction of the vitality of the grain, even when showing no sign of injury in appearance, hence so much failure. My seed corn was selected and husked early and at once put into crates and placed directly over the heating stove in the room where the men spent their evenings; it got perfectly dry before cold weather; every kernel has grown, and we have a fine stand to reward us. It would pay to give a little more care to the selection and keeping of the corn for planting. J. S. WOODWARD.

Niagara Co., N. Y.

Dairy Husbandry.

DAIRY NOTES.

T. D. CURTIS.

RANK FOODS MAKE RANK MILK.

It has long been a mooted question as to whether cabbages, turnips and other rank-smelling vegetables can be fed to milch cows without their taint being imparted to the milk. Some say they can be safely fed in small amount; others say that if they are fed just after milking, all bad effects will disappear before next milking time; while others say they will always taint the milk more or less, according to the amount fed. I suspect the latter are right, and that the longer as well as the more these rank vegetables are fed, the more injurious the effects. In a short time the cow will become saturated with their odor and flavor, and these will appear in the milk until they are eliminated from the cow's system. There are other foods that are more suitable for milch cows, leaving the rank ones for other stock, so that it is not worth while to take the risk of feeding them to dairy stock. Beets are much preferable, and make nice, sweet milk. Carrots are favorites with some, but if fed in large quantities they impart a sort of smoky flavor to milk.

MILK-PRODUCING AND BEEF-PRODUCING.

THESE are two quite different things, yet beef producers often consider themselves dairymen. Hence it is that we hear so much said about the desirability of beef and milk from the same animal. With the beef producer, milk is an incident, a by-product: but, of course, the more he gets of it, the more it adds to his profits. His eye, however, is mainly to beef, and for this reason he is not properly a dairyman, but a beef-producer. But who wants to eat cow beef? Nobody who can get better. It is used mostly for canning purposes, when not sold by city retailers in cheap quarters. Cow beef will never amount to much unless we slaughter the cows at seven to nine years of age, as they do in Holland, instead of keeping them until they are 12 to 15 years old, and drying up their milk because their teeth get so poor that they cannot eat. Really one should not look for beef in a milch cow, for it will be of very poor quality, and she ought to pay her way with the milk she gives. What is wanted is a breed that will turn out good beef steers, and good beef heifers when rejected as milkers. This several of the breeds will do. But the first consideration with the dairyman should be milk. Veal and beef are his by-products.

SALTING BUTTER.

ANENT the salting of butter without working, a correspondent writes that he does it in the churn. He uses a "square-oblong" churn. After washing—one washing being in brine with "a handful or two" of salt thrown in—he lets the butter drain. Then as it is evenly spread over the bottom of the churn, he sprinkles over it nearly half the salt required—an ounce to the pound, made fine by rolling or otherwise, if not already so. Next, he unhooks the churn, and gives it a quick flop to throw the butter on the side next to him. Nearly all the remainder of the salt is then sprinkled on, when "another flop of the churn the other way will take the butter out of the corners not before reached." The balance of the salt is now sprinkled on, none of the granules being smashed by dipping out, and he finds it secures very even salting. The churn is now slowly revolved until the butter is gathered into a solid mass. After this it is taken out and allowed to stand and drain an hour or more, when it is slightly worked and ready to pack. If the buttermilk is well washed out and the butter well drained before the salt is sprinkled on, the butter will be ready to pack directly from the churn, without taking out and draining and working.

STRONG BUTTER, WEAK IN FACT.

THE strong quality in butter is its weak point, notwithstanding this may seem paradoxical. If rank, it does not improve its standing. The trouble is usually in the manufacture, although good butter is very sensitive to surrounding influences, and is often spoiled by the way in which it is kept—or, rather, is not kept. Says Col. McGlinsky: "Look at a dozen packages of farm butter and you will see a dozen shades of color, from the immaculate white to the brick-dust red; and from the solid boring, grainy specimen to the salvy grease; some will be as salty as a last year's codfish, while others will be as free of salt as spring water. Some of it will be as streaked as Jacob's cattle, and possibly twice as strong." Every one who has frequented a country store will recognize the truthfulness of the picture. A preponderance of all the butter made in the United States is made in small, private dairies, in which no sort of progress is made, and honest thoughtlessness turns out only abominable stuff, and imagines it excellent. As the owners of such dairies do not read dairy papers or attend dairy conventions, how can they be reached? Shall it be by itinerant instructors, as in Europe? Can we get a little chemistry of everyday life into our common schools, and reach the rising generation in this way? Something ought to be done, for this is too expensive a way to supply the demand for grease. It would be far preferable to keep all bogus butter grease in its natural state to supply the grease market. Economy demands that something be done. But what?

SHOULD BUTTER BE COLORED?

THIS is a mere matter of taste—not so far as the palate is concerned, but the eye. June butter is considered best the world over, and this has a beautiful yellow tint, hard to imitate, but which is closely approximated. Everybody likes to see it, and the bogus butter men are ready to gratify the eye. Their product, however, is a counterfeit. Not so the genuine butter, except so far as its color is concerned. This, then, is an innocent cheat—a practical "white lie"—on the part of the dairyman. The color adds nothing to the quality, nor does it take anything from it, if a good color preparation is used. The amount is almost infinitesimal. But the color is a fraud—a harmless fraud—which all manufacturers of butter color are interested in keeping up. It enables the dairyman to make butter of about the same color the year round. He can do this in another way. Early-cut hay and corn-meal, with oats, middlings, wheat, corn, or something else to make up the balance of nitrogenous material, will do it, if the cows have proper care and shelter. It will even impart some of the June flavor. This is an excellent way of coloring butter, and I can commend it without any disposition to injure the butter-color men—notwithstanding they are powerful accessories in the manufacture of counterfeit butter.

The Poultry Yard.

ONE RURAL COMFORT.

GEN. WILLIAM H. NOBLE.

FINE poultry brings joy and profit to the farm. The cock's crow in the watches of the night and hailing the dawn, the turkey's gabble, the goose's call and the quacks of ducks are the out-door home music of rural life. I would as soon have the farm without garden, barns or fruit as bare of a well stocked poultry yard.

What a comfort to the little and the big of the household, are the peeps and busy food-search of the chicks, the plaintive call of the turkey mother and her brood's response, the waddlings and the washings of the downy ducklings, the cackling concert of the barnyard over the new-laid egg. These make up one great joy of rural life.

Then, if the farmer listens to the great poet's counsel: "Put money in thy purse, Horatio," he cannot quicker load his pouch than from the poultry-yard. As a food supply to his own table, how nicely it varies the steady drag and array from the pork barrel and the smoke-house. How joys the festive board with chickens broiled and fricaseed, with the well-browned turkey's savory roast, and in the luscious tenderness of the grass-fed gosling and the ducks. The purse joys when thus the meat wagon's daily call is saved.

Then when you look to the markets for profit on your stock, how much sooner can "Horatio put money in his purse" out of his poultry-yard than from the swine, beeves and sheep in his pens, stalls and pastures. Pound for pound, how much greater the profit! Four to six cents per pound will limit the average of the latter. The poultry price will run up into the teens, and never be much or long below in the biggest wholesale marts. Besides, with decent care of food, housing and feeding range, poultry can be profitably marketed at as low figures as the beeves, mutton and porkers. Is there any doubt of this? I speak now merely of the flesh food.

But when you figure on the egg crop of the poultry-yard, I believe this alone will yield a profit equal in ratio to that of the stalled ox or swine, or from the wool and flesh of sheep. In no case will fullness come to the purse but through that care and sense, without which no profit comes to any line of industrial product. I should only claim this egg profit from good, healthy, laying strains, well cared for as to food and shelter. As to either eggs or flesh, there is a good deal to be said about breed and breeding. To these, in any line of farm stock, the average farmer takes little heed. It is pretty much of this sample with all he raises on the farm—flesh, grass, grain or fruit. He runs in ruts, as a rule, or does not run at all. Yet, thank God! for him and our country, by the help of such journals as yours, he mends his pace slowly.

You ask will the farmyard poultry pay shut up? No, not as a business. To amount to much more than a supply for your own table the poultry crop wants to be in proportion to your domain and your other products. No city-yard style will do on the farm. Its like will never make a paying branch of farm industry, for several reasons.

First, because the farmer has enough to do without such paltry care as shut-up fowls demand. 2. Because all poultry is healthiest, better fleshed and more profitable with a range of feeding ground. In these days wire netting will so cheaply corral a flock, so protect your garden and near-by plow land in the crop season, that no farmer should think of putting poultry in a close pen.

Poultry, when given a chance, feed as much on grass as grain. They throughout the year consume great quantities of green or half decayed vegetable food, and will eat hay in Winter almost like a stalled ox. Besides, "all is grist that comes to their mill," which they can swallow. No end of insect life is squelched and held back by their endeavors. A skirmish line of turkeys through a stubble or new-mown field, equals in order and array that of soldiers advancing to a fight. The whole poultry tribe are great foragers. Whenever anything is to their liking, to nibble or to dig for, they are sure to find it.

I say, therefore, to the farmer, don't call yourself such unless you make poultry care and culture a feature of your life; never, except for discipline, keep your poultry shut up in narrow quarters.

I never would buy a farm, or tenant one, through, or skirting which some rippling brook or good stream, with pools and rapids, did not run. At any rate, I should not choose any where an ample and clean supply of water could not be had for all the needs of poultry life and taste.

You pictured some years since in your journal this joy of the poultry tribe: A cheap dam of stones held back a pool and made a minute waterfall on a swift brook; on and around this gamboled, or quietly sailed, the aquatic tribe. Others searched along the shallows of its brink for tid-bits of bugs or worms, or tiny fish.

Let all farm life cherish as its proper belonging and loveable feature and profitable charge the poultry tribe. Arrange to feed this stock well with the least possible care. Get good breeds for flesh and egg production combined. Then improve them by studying the points of your stock, and only breed from the best.

Within 20 years the quality of poultry stock and its egg product have vastly increased. The origination of new breeds combining both of these aims with hardy constitutions and adaptation to our climate, have helped the beauty and profit in this part of farm industry. In a class of animal life on which improved crosses tell so markedly and quickly, there is hope for vast gains under skillful mating.

Experiment Grounds of the Rural New-Yorker.

THE YELLOW WOOD—CONTINUED FERTILIZER EXPERIMENTS UPON POTATOES IN A POOR SOIL—THE RURAL'S RYE-WHEAT HYBRIDS.—PEA TESTS.

THE YELLOW WOOD AGAIN.—The writer is sitting under the specimen of Yellow Wood so often alluded to in these columns. It is the 7th of June. It was planted about 11 years ago, and is now 36 feet in diameter at the base, for the branches nearly sweep the turf. We wish our readers could see it now, and then tell us if we have said a word too much in its favor. Its drooping panicles of pure white pea blossoms from six inches to a foot in length, are so numerous as to fairly divide the graceful tree between green and white. This tree is grace itself and—life. Its branches, long and slender, respond to every breeze, swaying slowly up and down, more slowly now, indeed, from the weight of its thousands of snowy blossoms. There are many trees, like the big, stubby-limbed horse-chestnuts, that are dull, heavy, stupid-looking. Except in a gale, their leaves alone move. They excite no admiration or affection. We do not care to talk and associate with them. But we could not part with our Yellow Wood. We admire its wide-spreading, gently-swaying branches, its soft, green foliage, its airy, sprightly grace as if they were the charms of a friend. And yet this trees has its faults. It will not stand contact with any other tree, or scarcely close proximity. Many of the inner leaves turn yellow early in Summer, and keep dropping. Occasionally a small branch dies without apparent cause, though not to the disfigurement of the tree, so far as we may yet judge. The bark of the tree is always smooth, and the stems are not attacked by borers, as are the locusts. We should be glad to hear from our friends who have single trees of the Yellow Wood 20 years or more old.

FERTILIZER EXPERIMENTS UPON POTATOES.

Such experiments often contradict one another, and years are required before any definite conclusions can be drawn. The experiments made here two years ago were not contradictory. They all told the same story, viz., that the land needed *complete* fertilizers and that a good crop could not be grown without them. The present experiments, upon the same unproductive soil, point to the

same conclusion, and in fact, as now judged by the growth of tops, are essentially a repetition of the results obtained in 1884. During the past 10 days the condition of the plants has been estimated by two persons, neither knowing the fertilizers used in the trenches so judged. Ten indicates the best and 0 the poorest plants:

		Rated at
Plot 1.	Nitrate of soda	3
" 1½.	*Nothing*	3
" 2.	Sulphate of ammonia	4
" 3.	Dissolved boneblack	4
" 4.	*Nothing*	2
" 5.	Sulphate potash	2
" 6.	Plaster	1
" 7.	*Nothing*	2
" 8.	Nitrate of soda and dis. boneblack	2
" 9.	Farm manure	4
" 10.	Nitrate soda and sul. potash	2
" 11.	Dis. boneblack and sulpate potash	3
" 12.	Nitrate soda, dis. boneblack and sul. potash	3
" 13.	Raw bone, fine and coarse mixed	4
" 14.	Farm manure	4
" 15.	*Nothing*	2
" 16.	Hen manure	3
" 17.	Complete potato fertilizer, 800 lbs. to acre	8
" 18.	Farm manure	5
" 19.	Complete potato fertilizer 1,200 lbs. to acre	9
" 20.	Acid phosphate, muriate potash and nitrate soda	6
" 21.	Acid phosphate	3
" 22.	Nitrate soda, muriate potash	4
" 23.	Ground fish	5
" 24.	Complete potato fertilizer with *mulch*	9
" 25.	*Nothing*	2
" 26.	Hen manure, double the quantity used in Plot 16	6
" 27.	Blood, nitrate of soda and sulphate ammonia applied at the rate of 1,100 pounds to the acre to ascertain if nitrogen, supplied in superabundance, would give a large yield	7
" 28.	Complete potato fertilizer, 1,200 lbs. with the preceding nitrogenous fertilizers 600 lbs.	10
" 29.	Same as 28, mulched	9

The average of plots which received the *complete* fertilizers is eight. The average of those which received hen and farm manure is a fraction over four. The average of the trenches which did not receive either fertilizer or manure is a fraction over *two*.

We shall expect that the farm manure plots will improve as the season advances, and that the plot to which nitrogen alone was furnished in excess will not hold its present rating.

It will be seen that several of these experiments are designed to show whether acid phosphate (that is, S. C. rock dissolved in sulphuric acid) and muriate of potash will serve as well as dissolved boneblack and sulphate of potash. The only contradictory part of these tests is shown in plot 12, which, though it received a *complete* fertilizer, is ranked but three. We have another series of potato experiments which differ from the others in the methods of planting—the fertilizers being the same—which promise to be of interest to our readers.

THREE-QUARTER RYE HYBRIDS.—There are 11 plants from the cross of rye pollen upon a head half wheat, half rye, made last Summer. The first plant bears regular wheat heads inclining to club-shaped, beardless. The upper part of the culm is downy. No. 2 is a regular beardless elliptical head, resembling wheat without down on the culm. No. 3 bears a small head heavily bearded, the straw or culm without down. No. 4 is a regular beardless head without down. No. 5, a very loose, barley-like head without down. No. 6 is a narrow, beardless head with down. No. 7 is a loose-bearded head with down. No. 8 is like No. 1. No 9 is a tall plant, bearing 22 bearded heads; culm downy. All the heads seem to be sterile. No. 10 is also tall, culms slightly downy, probably sterile. No. 11 is a short, beardless head, hairy culm. We anticipate great changes in these plants another year. It will be remembered that from the three-quarter rye plant of 1885 several imperfect seeds were obtained. Three plants grew. They bear fine, regular, half-bearded heads, and the culms are all hairy. No further resemblance is thus far developed towards rye in these three-quarter rye plants. The best of the heads were selected, and after castration rye pollen was again applied several times.

THE large plot of wheat-rye hybrids, all from one seed planted four years ago, is now the most interesting of all. Upon this plot we have heads of all sorts, though the seed sown was from heads quite uniform in appearance, all being half-bearded, regular in shape, with downy culms. The straws of some of the plants are three times the thickness of ordinary wheat straw. Some are denseley downy, others are perfectly smooth. Twenty-five heads could be selected from this plot differing as much from one another as do any wheats in cultivation. Some of the heads are compound. Illustrations will appear later.

PEAS.—It was claimed by Mr. Cleveland, of St. Vincent, N. Y., the originator (by selection) of the Alaska Pea, that it was the earliest blue pea in cultivation; that the pods and peas remain green longer than those of any other variety; that 90 per cent could be gathered at one picking. In order to test these claims a row 50 feet long was planted April 9th, and beside it a row of the Clipper Peas sold by W. W. Rawson & Co., of Boston, Mass. This last was selected, first, because we had never tested it, and, second, because it was assumed to be a fair type of the "First and Best" sold by all seedsmen.

The first picking was made June 12. The vines grow to the same hight, four feet, and present no notable differences. Both varieties seem to mature at the same time and to be equally productive.

ALASKA: 100 pods weighed 16 ounces; contained 686 seeds which weighed six ounces.

CLIPPER: 100 pods weighed 16 ounces, contained 672 seeds which weighed six ounces. It will be seen there is no real difference in the size or earliness. The peas were cooked separately, and eaten by six persons. The Alaska when cooked is a lighter or more yellowish-green than the Clipper. Four of the six judged the Alaska to be "more sugary" than the Clipper, and that the Clipper had more of a pea flavor. Two preferred the Alaska, four the Clipper. All agreed that the difference was infinitesimal.

Farm Topics.

CORRESPONDENTS' VIEWS.

THE average hired man is an important but sadly neglected member of the farm stock. I wish to say a word concerning his treatment, being one of the band myself. Few people know what farm laborers suffer. If they did know, the laborers would receive better treatment. The average "boss" regards his hired man as a superior horse or cow, possessing no more feelings than a piece of farm machinery. He is paid his wages, but there preparations for his comfort stop. His bed-room is usually an attic or some other room where nobody else will sleep. How can he do a good day's work unless he is made comfortable? The floor seldom sees a broom. If the bed is made (unless by himself), it is the next thing to a miracle. Often three or four men are crowded into one small room. The furniture consists of any rubbish that is not required in any other part of the house. If a chair is wanted in another room, the girl is always told to get it from the men's room. A basin is never considered necessary, and nobody thinks the hired man ever wants to take a bath. He can walk to the pond or river for such a foolish operation. The hired girl apes the methods of her master and mistress, and orders the hired man about at will. If the "boss" happens to be out with a horse at night, the hired man is expected to stay up to unharness. This is never supposed to interfere with his early rising next morning to do the "chores." Should there be any company, he is expected to wait for his meals till the family have finished, though no one needs food more. All farmers do not use their help in this way, but too many of them do, and to my mind they make a great mistake. There are very few hired men who would not make a quick return for a little kindly attention to their needs and tastes. Try it, farmers; a hired man is not a brute. Why should you try so hard to make a brute of him? HIRED MAN.

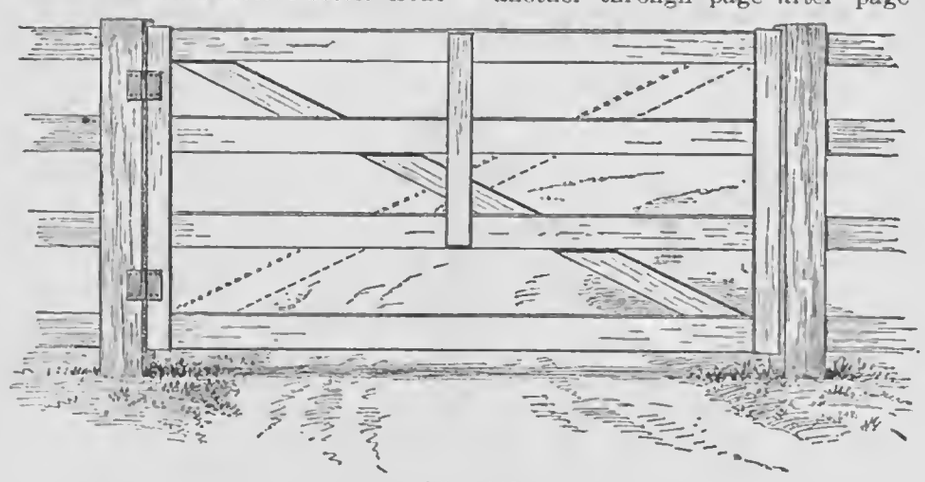

Fig. 269.

A HORSE that is gentle and safe in all positions is worth three times as much as one of equal ability that cannot be trusted. If I wanted to pick out a colt which offered a good ground-work upon which to build an education, I would look for width between the eyes, a large brain, a pleasant look out of the eyes, and a fine coat of hair. If you teach a colt to expect a blow instead of a caress, you will be sure to make a brute. If you tease him, look out for his heels when he grows up. I prefer a short, compact horse to a long and leggy animal. The first is tougher and costs less to feed and care for. D. W. D.

Des Moines Co., Iowa.

The washing machine which I obtained as a present from the RURAL gives great satisfaction. It is the best machine I ever saw for cleaning clothes with the least labor. We have a beautiful herd of seven little Jerseys. One of them, one year and 26 days old, has a heifer calf by her side, and last week I made six pounds of butter from her milk, fed on grass alone. She is a perfect little beauty. The Jerseys cannot be excelled for the dairy.

Nunda, N. Y. MRS. J. E. M.

I NAME no names. I content myself with saying that in more than one respect certain nursery catalogues stand sorely in need of improvement. The spelling is bad; the grammar is still worse. One man is unable to give correctly the name of the most popular of pears; another through page after page tramples upon the laws of English syntax in a way of which a schoolboy would be ashamed. What matters it? I answer that to the nurseryman, at any rate, it matters much. A nurseryman who gives proof positive that he knows very little about his mother tongue, gives by that very fact proof presumptive that he knows very little about the practical science to which he is more especially devoted. Horticulture calls for intelligence. An ignorant man may, indeed, grow fruit trees, but he will grow them in much the same way as the Irishman played the fiddle. For such trees and such music most of us have small fancy. Thus much for the present. More anon.

A CATHOLIC PRIEST.

IN old dairy districts there is always to be found some old farmer who is an expert at selecting dairy stock. It is hard to deceive these farmers into buying a poor cow, yet they will frequently keep a cow of their own raising, three or four years, that they never would buy at any price. A good butter cow, whether Jersey, Holland, Ayrshire or scrub, will be sure to approximate to a certain model, just as most of the beef breeds are of much the same shape. A dairy cow raised on the rich pastures of Holland will have about the same shape as an Ayrshire raised on the barren Scotch pastures. There are differences in color and size, but the shape must be the same and the same organs must be developed in either animal. This holds as true of scrubs or grades as it does of thoroughbreds, and it is what guides dairy experts in their selection of cattle. A good milker, no matter what the breed, must possess a feminine appearance. Heifers with a coarse, masculine appearance will never make good milkers, in spite of good feeding. They will put on flesh easily and work off their surplus energy in fighting, breaking down fences—in short, doing anything but milking. A masculine heifer looks like a steer. She is coarse in the legs and horns, with a heavy head, neck and fore-quarters. A good cow should have a distinct "cowey" look. She should be fine in the limbs and head, with slender horns, thin neck, light fore-quarters, yet wide enough to make room for a good-sized heart and lungs. I would look for a large stomach, short legs, large udder and milk veins and a small tail. F. K. M.

St. Lawrence Co., N. Y.

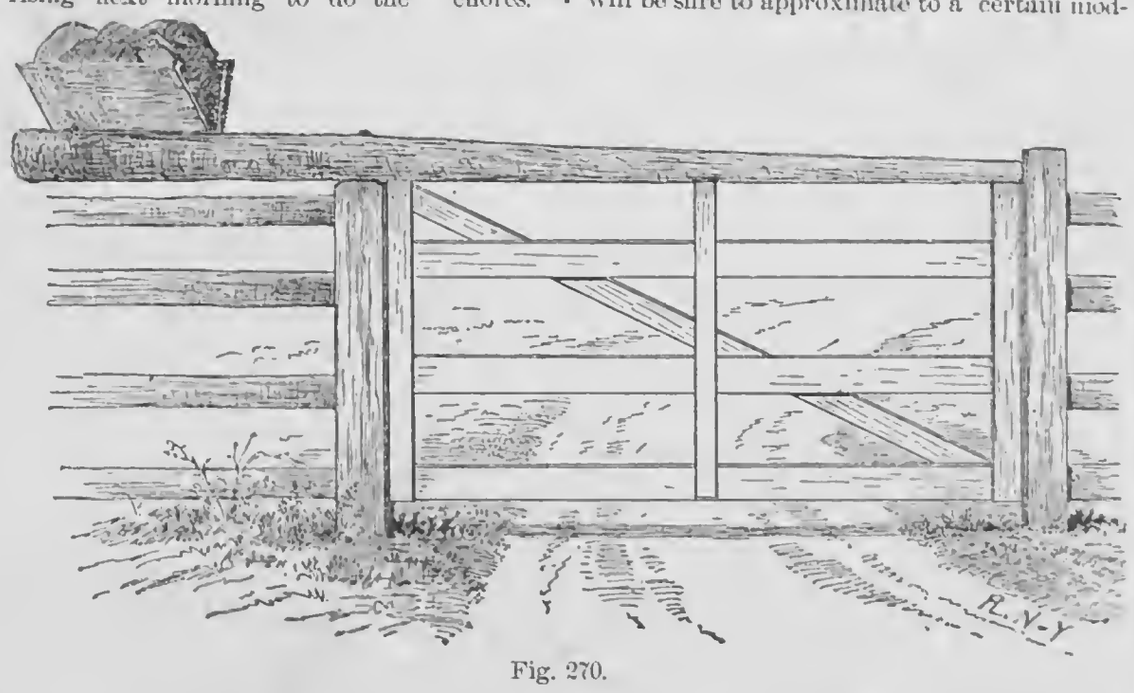

Fig. 270.

I HAVE for several years been testing as to the hardiness and productiveness of raspberries. I would place them in the following order: Tyler, Doolittle, Ohio, and Gregg. The Tyler is very hardy and productive. The Ohio follows in good time, somewhat later, and it is a large yielder. The Gregg, the latest of all, and liable to be winter-killed, is only profitable on good upland and in protected situations. Of the red, the Philadelphia and Turner are perfectly hardy and yield a crop every year. The Cuthbert froze back to within two feet of the ground. It is a fine berry, but not as hardy as I would like. The Marlboro wintered better. Shafer's for six years has proved very hardy and productive. I have not lost a bush from any cause. Insects and blight, that affect black raspberries, do not trouble it. This is enough like a black-cap to be classed as such and to take their place, as it is gradually doing with those who know its worth. Were I to confine myself to one berry it would be this. There are no suckers which with many varieties of the reds, are as troublesome as weeds. C. M.

Onondaga Co., N. Y.

Farm Economy.

NOTES ON SWINGING GATES.

NOT long since a correspondent sent us the drawing of gates shown at Fig. 267-268. He wished to prove that the longer post, as in Fig. 267, gave an added strength to the gate. We submitted the drawings to Prof. R. C. Carpenter, who replies in substance, as follows:

"The strain on the hinges of a gate is the same whether the brace is inclined toward the bottom hinge or from the top hinge toward the bottom of the gate. This is proved by a proposition in physics or mechanics termed the Parallelogram of Forces, which is that, 'If two sides of a parallelogram be given, the direction of two forces and a length proportional to these forces, the diagonal of that parallelogram will be the resultant force.' From this we can deduce a simple rule for finding the strain on the hinges as follows: Divide the weight of the gate by the distance between the hinges, and multiply this result by the width of gate. In all cases of two hinges and a vertical post the pull on the top hinge will equal the push on the bottom hinge.

As an example, suppose a gate five feet between the hinges and 10 feet wide, weighs 200 pounds; strain on each hinge equal (200-5)x10=400 pounds, the tendency to overturn the post is the same, no matter what may be the hight of the post, provided the weight is the same. In this case the tendency to overturn is found by multiplying the force acting, by the distance, or arm with which it acts. Thus, in the last case, there were 400 pounds acting to overturn the gate post at a point five feet from the lower hinge. This would be equal to five times 400 pounds, or 2,000 pounds, acting at the lower hinge. If the hinges were twice as far apart the effect would be the same, because the pull on the upper hinge is lessened as much as the distance is increased. Thus, if the hinges were 10 feet apart by the rule given, the pull on the hinge would be (200-10) x10=200 pounds. This multiplied by 10, the distance, gives 2,000 as the tendency to overturn. So far as theory is concerned, it makes no difference whether the gate is built in one or the other forms shown at Figs. 267—268.

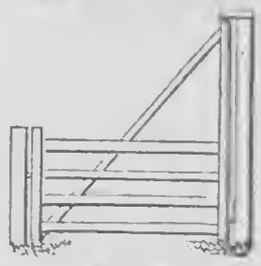

Fig. 267.

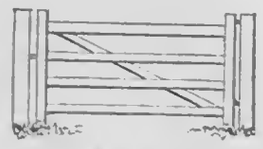

Fig. 268.

As the direction of the brace or diagonal of the gate is of no moment, I should consider the best form of gate one that provides the greatest strength with the least material. The form in Fig. 268 is superior to the form in Fig. 267, simply because it has less timber and is less expensive to build; the brace will do equally good service from the other corners.

My own observation leads me to believe that the form of post gate in Fig. 269, is usually

made unnecessarily heavy, and the result is that the post is soon pulled over to such an extent that the gate drags on the ground. The short post in Fig. 269 can be readily stayed by a fence. The hinges in use on the post gates are often capable of improvement, and usually give more trouble than the posts.

A form much used consists of a wedge with a hole at the end driven into the gate, and a wedge with a pin at the end driven into the post. These soon work loose, and let the gate out of line. They should be of such shape that a nut could be put on the back side of the post.

Were I to give my opinion as to the most sensible gate mechanically, I should no doubt refer to a form which can hardly be said to be new, but which has proved its many good points by holding its own against all innovations for years. See Fig. 270. It is a form easily built, has all strains balaneed, opens easily, is strong and cheap. It was used by your forefathers, and is better to-day than any patent gate I know of.

THE BENEFIT OF MUCK WHEN APPLIED TO GRASS.

Composted and alone; differences in intrinsic value and in results on different soils; retentive of fertility; for corn, oats and grass; as a preventive of drought; as an absorbent.

A CORRESPONDENT of a Western agrieultural paper, in speaking of his experience in the use of muek, says that a good supply of coarse manure, to be mixed with the muek, is indispensable, in order to derive any praetical benefit. That composting with manure is far the best way in which to utilize muek I have no doubt; but there are other ways in which some benefit may be derived and as all farmers have not a sufficient supply of manure on haud at the proper time for making compost heaps, I wish to say to such not to neglect to try the effeet of muek alone. I have used muek in almost every manner and for a number of years, and by its aid I have changed a rundown farm to one of the most productive in this locality. When I commeneed its use I had very little manure on hand, and hence used the muck alone from necessity. There is, of course, a vast difference in the value of muck, as well as in its effects when applied to different kinds of soil. The same may be said of any eommercial fertilizer, and in this connection let me say that I have found that a good dressing of muck upon soil of a gravelly character is of much assistance in getting the full benefits of superphosphates. It is generally conceded that the latter are of the most value when applied to heavy loam, and that such soils retain the fertilizing qualities longest. The tendency of muck, when applied to light soil, is to furnish a substanee which retains much of the soluble qualities of the superphosphates, and prevents, to a eertain ex tent, their leaching away.

My first experience with muck was by an application direct from the swamp. I had but little manure, and, wishing to plant corn upon a field that was pretty badly run down, I drew out and covered about one-half of the lot with muck, saving what manure I had for use in the hill. The effect upon the eorn crop was not apparent, exeept that the portion of the field treated with muck was more backward than the other part. It appeared to have been chilled, and although the soil was practieally the same in the whole field, I think this part was fully a week later in growth, and also in ripening. There was no difference in the yield of corn or stalks, and my first impression was that my labor in drawing the muck had been wasted. The corn was followed by oats, and my reeollection now is that I failed to note any difference in the crop, but the prime benefit became apparent as soon as the field was seeded to grass, and from the first season's cut of hay until the lot was plowed up again—some four years—the muck-treated part yielded from 16 to 20 per cent. more than that portion where no muck had been used. [Isn't it possible that the better effects were due to the freer liberation of the fertility in the muck or the greater development by it of that in the commingling soil owing to lapse of time rather than to any special benefit the application would confer on grass over corn and oats? If corn and oats had been sown on the plot the third year, might not the effects have been as noticeable as in the case of grass? It would have been more satisfactory had the experiment been tried at least on a small plot in the field.—EDS.] Upland meadows of gravelly soil are frequently liable to dry up so badly before Timothy can acquire a full growth, that not more than half a crop of hay can be secured, and sometimes the quality of that is injured by becoming raspish. I have found that where muck had been used freely on such meadows before seeding, the ground retained moisture much longer and was less liable to suffer from drought.

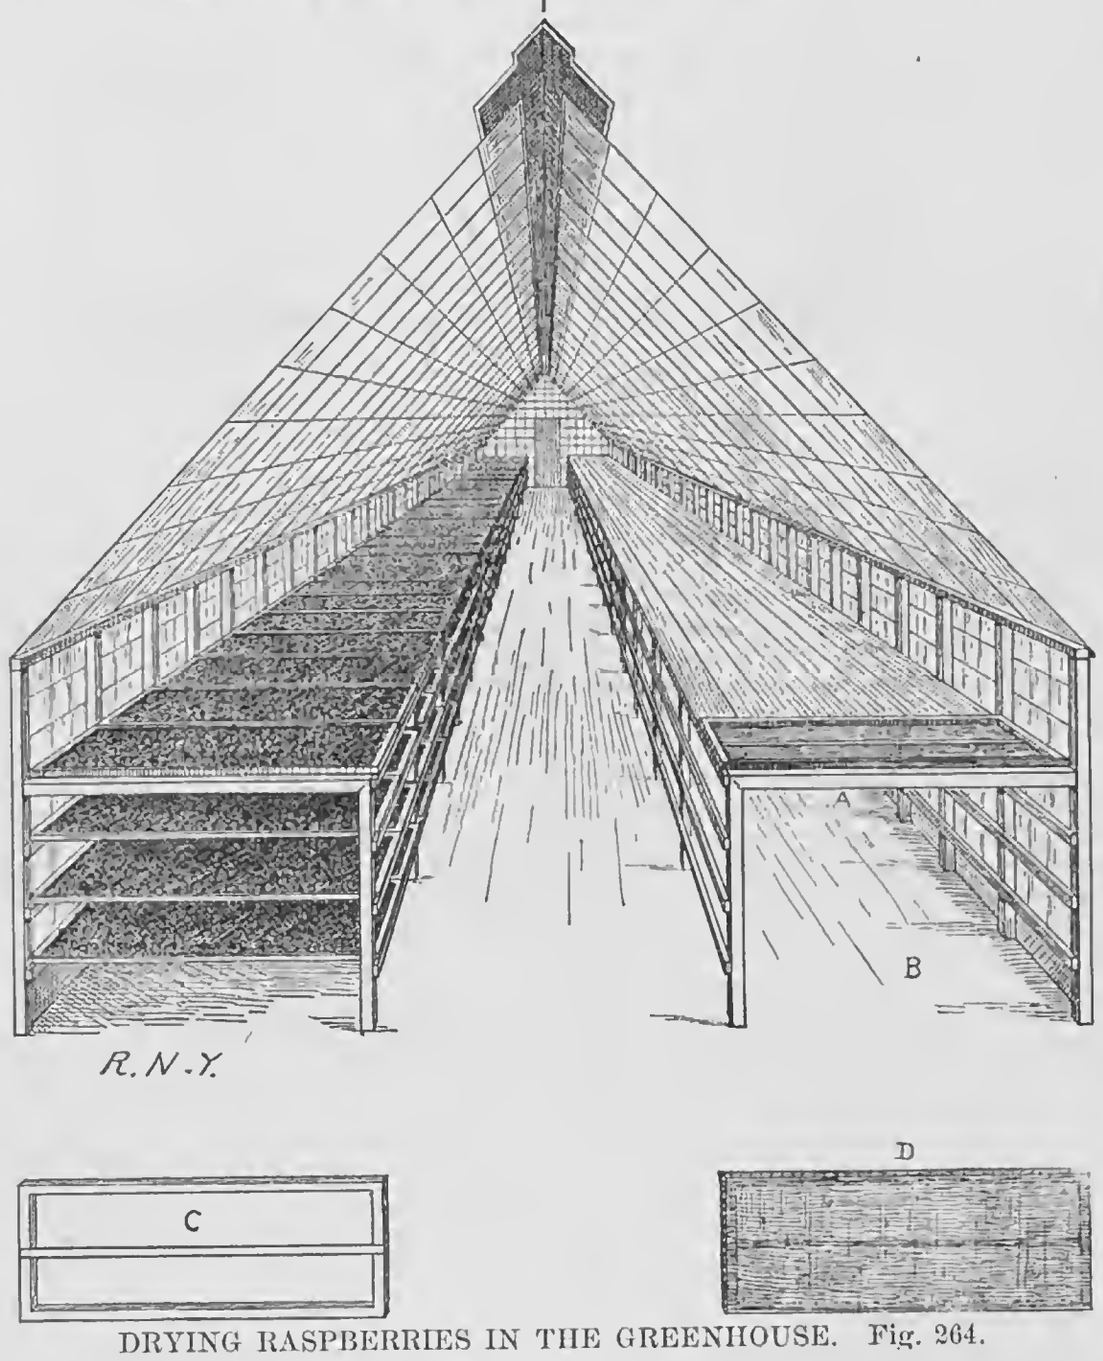
It is well to dig out the muck as long a time in advanee of its being used as convenient, giving it an opportunity to dry thoroughly. I draw my muck generally with a one-horse eart, but have frequently moved a good quantity, when the ground was frozen, on a sleigh, using two by four scantlings for bottom boards and dumping through the bottom, thus avoiding shoveling more than once. I think that three loads of a compost, made from one half each manure and good muck, are so nearly equal in value to three loads of pure manure, that no farmer can deteet the difference in the result when applied to a erop. I find, however, that it pays, when using this eompost for potatoes, to mix in a small quantity of wood ashes, in the hill. Any one having a manure vault cannot do better than to keep a good supply of dry muck on hand for absorbing the liquid manure, and the value of manure made in this manner cannot be overestimated.

HENRY STODDARD.

Columbia Co., N. Y.

DRYING RASPBERRIES IN A GREENHOUSE.

Mr. J. S. Bennett proposes to use the greenhouse as a place for drying fruit. His arrangement is shown at Fig. 264. Strips of wood are nailed on the posts both front and back, as shown at B. These are left about eight inches



DRYING RASPBERRIES IN THE GREENHOUSE. Fig. 264.

apart. A shows the way the sieves are placed. The sieves, shown at C and D, are made of inch pine boards. They are just long enough to reach from the strips at the windows to the strips in front, and are one foot nine inches wide. A lath is fastened to the under side of the frame, sunk into the board so that it will be level with the frame. The frame is covered with stout muslin cut a little larger that the frame and turned up at the edges so that it can be tacked on more securely. At the left of the picture the sieves are arranged as desired for drying. The drying is done on a clear, bright day with the aid of a good fire. It is desirable to heat the interior of the greenhouse to 130°. The ventilator is raised about two inches, thus securing ample ventilation. Care should be taken to avoid putting too many berries in the sieves, about five quarts in each will be enough. They should be spread out as thinly as possible. Mr. Bennett estimates that berries will be thoroughly dried in two days by this process, and the great number that can be handled at one time will make it profitable for those who have greenhouses and small fruit plantations to make use of it. There will be little cost for fixtures at all events.

Miscellaneous.

RAZOR STROPS.

EVERY farmer should be prepared and know how to give himself a good shave, as very few are situated convenient to barber-shops, and if one is fortunate enough to be in easy reach of one, he usually wastes more time in getting shaved than would be required to shave himself half a dozen times, and then, unless he possesses a razor and cup of his own, he risks a filthy job. By the aid of the accompanying drawings any reader of this paper

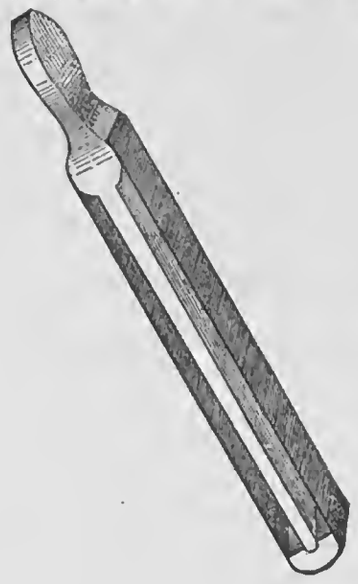


Fig. 265.

will be able to make himself a better strop than can be bought, and at little expense.

Fig. 265 plainly shows how the handle and stretcher are fashioned out of one piece 1¼ inch square and 16 to 18 inches long. Straight-grained pine or bass-wood is light and the best; but a hard wood will do. The leather, which should be the finest-grained and smoothest obtainable (thick, firm Russian leather is best, but costs most), should be of the same width as the stretcher, and long enough to go twice the length of the latter,

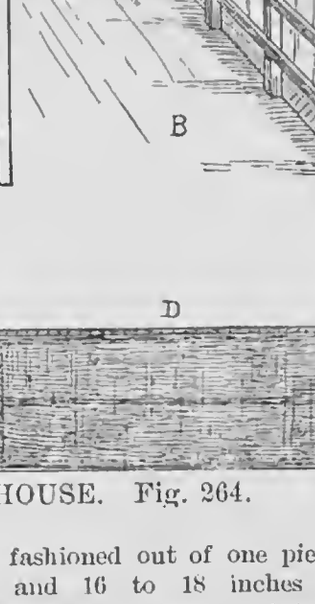

Fig. 266.

and be glued to both sides of the square part of the handle, grain, or smooth side, out. La Page's liquid glue is the best, and very useful for any purpose where glue is needed. It is always ready for use, and every farmer should have some. The block has a groove to fit the streteher, and is made wedging, so as to stretch the leather firmly. If the strop should get slack, put a thin piece of leather, about the size of a wedge, against the strop and force the wedge in again. A very fine emery paste should be put on one side of the strop, upon which to touch the razor up when dull. If you can't get the paste already prepared, a very fine emery rubbed on with a little oil, will answer every purpose.

To make the strop shown at Fig. 266, will require more ingenuity and skill; but it is the best. The central piece should be 18 inches long, one-half inch thick and one-and-one-half inch wide. The end enlarges to one-and-one-quarter inch in thickness. The blocks are fastened on with small hinges. The wire loops for holding the strop when stretching it, are made of No. 13 or 14 hard wire. One is shown detached at Fig. 266. This requires only half as much leather as Fig. 265. The strop is glued or stitched to the end wire loop, and when the rough side is wanted, is put over the end and tucked through another wire loop, when, by pressing the block down with the thumb, the strop is drawn tight, as shown in the upper part of the engraving. The strop, when stretched, should be 14 inches from loop to loop. Put the emery paste on the rough side of the leather, and never let any get on the smooth side. In fact, great eare should be exercised never to get any dust or other substanee on the latter. The strop should be provided with a case or be wrapped in clean paper when not in use. The good wife or sweet-heart cares more for you when you have a nice, smooth face, exeepting, of course, the moustache or side whiskers.

The farmer is apt to care too little about his personal appearance, and what folks may think of him. It costs very little in time or money to keep reasonably tidy, and if you keep so, those you associate with will have a better estimate of you, an important factor for suecess, both socially and in a business way.

Wakeman, O. D. Q. H.

What Others Say.

ENSILAGE—PROVED A SUCCESS.—It would seem certain that the system of ensilage is to become an established feature in British agriculture. These remarks of the London Live Stock Journal are prompted by the striking evidence in favor of ensilage which has been brought to light of late—not the evidence of enthusiastic advocates, it would seem, but the calm deliberations of judicial bodies appointed to consider and determine as to its working. The reports of the Ensilage Commission and of the judges of the Royal Agricultural Society's silo competition, have just been published, the former in a Blue Book and the latter in the Journal of the Royal Agricultural Society. Both bodies emphatically declare ensilage a success, and both reports are capable of affording encouragement to British farmers.

The Ensilage Commission classify the advantages claimed for ensilage under these three heads: 1. In rendering the farmer independent of weather in saving his crops. 2. In increasing the productive capabilities of farms: (*a*) in greater weight of forage saved, (*b*) in greater available variety and rotation of crops, (*c*) in increased facility for storage. 3. In connection with feeding: (*a*) dairy stock, (*b*) breeding stock, (*c*) store stock, (*d*) fatting stock, (*e*) farm horses. Taking each point in order, they remark upon the extent to which they consider the system capable of fulfilling the advantage claimed for it. In regard to independence of weather, it has been proved to them that ensilage is of great economic value, as it will enable farmers to avoid or minimize the losses sustained in attempting to save hay, especially second growths, in wet seasons. Then, as to increased productiveness of farms, it is considered that by means of ensilage a greater amount of food may be obtained from a given area of land than if the crop was made into hay. The feeding value of ensilage, weight for weight, is only one-third that of hay, but a ton of green food preserved by ensiling will weigh in silage five times as much as if it had been made into hay thus giving a decided advantage to silage. In this calculation it is assumed that the silage and the hay are both perfectly made and preserved. It is pointed out that by recourse to ensilage more varied and more rapid cropping may be practiced. Various grain and green crops may be sown in the Autumn, and cut for ensiling in June, which will "leave the land free for a second sowing, and thus increase its capabilities of annual production, while maintaining the fertility of the soil."

As to the feeding value of silage, the com-

mittee speak very favorably. They received the strongest evidence of the undonbted advantage of the system for the feeding of dairy stock. To breeding stock it had been given successfully, but in this case it had to be judiciously and carefully mixed with other foods. For store stock it forms a complete and wholesome food, and in fattening stock it compares favorably with roots. The advantage of its use is most apparent in the degree to which it enables a farmer profitably to consume straw chaff, rough hay chaff and other dry materials, which, without admixture with some moist kind of food, would not be palatable or advantageous to the growth of stock. A limited proportion of silage mixed with other food has been given to work horses with satisfactory results. The Commissioners, in conclusion, state that they endeavored to discount all exaggerated estimates, as well as to make allowance for a considerable amount of prejudice and incredulity which they met with, and they add: "After summing up the mass of evidence which has reached us, we can without hesitation affirm that it has been abundantly and conclusively proved to our satisfaction that this system of preserving green fodder crops promises great advantages to the practical farmer, and, if carried out with a reasonable amount of care and efficiency, should not only provide him with the means of insuring himself to a great extent against unfavorable seasons, and of materially improving the quantity and quality of his dairy produce, but should also enable him to increase appreciably the number of live stock that can be profitably kept upon any given acreage, whether of pasture or arable land, and proportionately the amount of manure available to fertilize it."

The reports of the Royal Society's judges are also very interesting and instructive, and are equally favorable to the system under investigation. The following concise summary of the experience of the judges of the northern division is worthy of production: "We are of opinion that the great question of satisfactorily ensiling green crops has received ample confirmation. It has been proved to us, incontestably, that its success has been manifested in every district. We have seen silos of brick, of stone and of wood; we have seen old barns and other buildings converted into silos; we have seen them sunk into the ground and built on the level; we have seen them containing 20 tons and we have inspected others capable of containing 700 tons; we have found silos constructed at a little over £20, and others at £400; we have found them filled with all sorts of green crops, and we have found some sour and some sweet—the latter in by far the greater proportion; we have seen them weighted with bricks, with stones, with slates, with sand, with earth and also with ingenious mechanical contrivances; we have inspected some chaffed, and in others the fodder spread out and put in whole; in all cases the practice was successful, and in every instance cattle of all descriptions did well on the silage, and in many instances the opinion was conclusive that decidedly more stock could be carried per acre with silage than with hay."

The report winds up with the following verdict: "The chief advantages of silage-making against hay-making is its comparative independence of the weather: that the fodder is handled, while green, without any risk of the tender and nutritious leaves being lost on the ground as in hay-making; that the resulting silage is succulent and palatable, and that on purely grazing farms it is now possible to obtain a portion of the grass crop for Winter in such a state as to equal the effect of summer-fed grass for the purpose of the dairy."

SALT FOR STOCK.—The National Live Stock Journal, noticing a recent communication in the RURAL regarding the feeding of salt to stock, makes the point that water is wholly innutritious, adding nothing of substance to any structure of the body. It is utterly indigestible, is taken as water, goes the rounds of circulation as water, and is finally eliminated from the system as water. All that can be said of salt in this line can be said of water. But does it prove that water is injurious, or useless? Does it perform no important office in the body, although not digested or assimilated? Water is absolutely indispensable. Without it, neither vegetable nor animal organisms can exist. It is a medium for dissolving all foods, and assisting in their circulation and deposit at the points where needed. Remove the water and everything would be but crumbling dust, to be blown about by the winds. What, then, is the force of the argument of the "justly celebrated medical writer and practitioner" against salt? He could not live without a certain per cent. of it in his blood, in which it is a constant element. It attracts water and keeps the blood fluid. In this respect, it undergoes more change than water does. Its crystals are dissolved, while water remains water still, from first to last. Yet one may injure himself by an excessive use of water, as he may by an excessive use of salt; and if he gets into water it will drown the life out of his body. Possibly he might smother himself in salt. But salt is nothing like as dangerous an element to deal with as water.

THE MEN WHO SUCCEED WITH SHEEP.—Scattered as they are, all over the country; addicted, of necessity, to diverse systems of management, nevertheless the men who have made a success of sheep husbandry, says the Breeder's Gazette, will be found to possess certain uniform characteristics. They are intelligent, experienced, prudent, persevering. Intelligent enough to appreciate their own surroundings, and to know the type of sheep best suited thereto, sufficiently experienced to know that their business is not necessarily a failure because prices for its product are not uniformly high. Prudent enough to escape the panic which periodically seizes their weak-kneed co-laborers, and to profit by the mistakes of those who persist in selling when sheep are low and buying when, as a result of such folly, prices again advance. Persevering, with faith in that average of results which has made for sheep husbandry as good a record for profit as can be shown for any other agricultural specialty. These are the men to whom those younger ones who think of becoming flock-owners should look for lessons, rather than to that class of talkers and writers who at times occupy the public attention, taking to themselves the credit for successes and blaming others with adversities. The road to success in sheep husbandry is the plain, simple track leading to success in other callings. The man who achieves his ambition must start right; must keep right; depending more upon his own efforts and judgment than on those of any other man or set of men. He must meet low prices with economical management and meritorious products; must keep his face to the wind, whether it blow high or low; keep head and heart when others quail; advancing only when sure of his footing, and never voluntarily taking a step backward.

POINTS FOR CATTLE BREEDERS.—Our friend Prof. Shelton of the Kansas Agricultural College, said, at a Missouri Farmers' Institute, that he never heard of anyone getting anything useful out of color in stock, yet nine farmers out of ten will not look at a Short-horn that is not red. So, many will condemn an animal because its horns have not the peculiar turn they fancy. Let us be sure that we do not base our selection upon some trivial matter that has no money value. All the valuable points of an animal may be divided into two classes; first, those that are in themselves useful; second, those that point to or vindicate the possession of useful qualities. Why do careful judges place such a high value upon touch—the texture of the skin? It is of no value in itself, but it indicates a long list of qualities that are indispensable. If the touch is hard and the skin hard and inelastic, lookout for a hard feeder and an animal that is slow and late in maturing. So, the flank is of little value in itself; it is a boiling piece of low market value. Yet the good judge knows that an animal with a long, deep flank will be a good feeder, with thick flesh and good constitution. The crop, again—the region just back of the shoulder—is generally ranked high, although it indicates nothing, but is itself a part of great value. The question is often asked: How can minor defects in a herd, or individual animal, be corrected? The advice generally given to correct such defects is to use a sire that is well developed in parts where the cows are defective. There arises this difficulty, however, in attempting to correct one fault—we are quite likely to develop defects of another kind. The best way is to employ males whose general character is good. Select, as a sire, an animal that is well developed, not merely in the region where the cows are defective, but in all other points; thus you will correct the evil of which you complain, and not fall into other errors.

SWEET AND SOUR-CREAM BUTTER.—John Gould says, in the Practical Farmer, that ever since Professor Voelcker announced why sweet cream butter was best, and if made understandingly was by far the best keeper, the churning of less acid cream has been regarded with more and more favor. P. McConnell, of England, the first dairy lecturer of that country, says of the two plans, sweet and sour cream butter: "By the former method the cream is used fresh, and it is possible to milk a cow, separate the cream, and churn it into butter in less than an hour, the product having the finest delicate flavor and the best keeping qualities. In the other system the cream is kept for several days to allow a certain amount of acidity to develop, this being sometimes further aided by the addition of a little butter-milk. The cream is churned more easily, and the butter is of a stronger flavor, but will not keep so long." This is very important testimony, but it does not relate, after all, to one very important point. Why does the butter made from the cream of the cabinet creamery, churned sweet, lack in flavor? The answer to this is that cream needs air to bring out flavor, and the closed cans preventing this, the cream must needs be left to sour. Professor Arnold, after long experiments, has concluded that flavor in butter is the result of the union of the oxygen of the air and the essential oils of the butter fats; but at the same time he would avoid souring the cream by long standing, and *ripen* it by heating it up to about 75 degrees as soon as it is removed from the milk, stirring it frequently until that point is reached, and then setting it away to cool down to somewhere about 60 degrees, and then he would churn at the appearance of acidity. This does in a few hours, and to a certainty, what would otherwise take 24 to 36 hours to accomplish, and gives a certain uniform result that cannot be attained by "chancing it" with the uncertainties of the atmosphere.

LONG-HORN CATTLE.—Bell's Messenger describes one of the few remaining English herds of Long-horn cattle. This favorite old breed of Bakewell's is seldom mentioned now. The more fashionable breeds, like the Short-horn and Hereford, have crowded it out. The herd described in the Messenger belonged to Sir J. H. Crewe, and was brought together more as a novelty than because of any superior excellence on the part of the cattle. Long-horns are picturesque and look well on a lawn or in a park. They are described as a handsome dark brindle in color, with a sheet of white all down the back and white spots at the thighs. They are well ribbed and deep and compact in form, with a high quality of skin and flesh. They have noble heads, a large proportion with tapering wheel-horns encircling the neck itself. Few breeds can rival the Long-horn for hardihood, constitutional vigor and longevity. They are excellent dairy animals. The milk is not large in quantity, but, like that from the Jersey, is exceedingly rich. In a test made some years ago, six Short-horn cows gave 152 pounds of milk and six Long-horns gave 135 pounds. The milk from the Short-horns made but 14½ pounds of curd, while that from the Long-horns made 19½. As beef animals, the present Long-horns do not excel. They have never been heavily fed from calfdom. Their principal points of merit are their toughness, their dairy qualities and their picturesque appearance.

WORTH NOTING.

CHEESE is a muscle-making food; and, in Europe, it is used by the peasant and working classes to an extent that has no general parallel here, says the Orange County Farmer. To people who work, and who cannot buy meat, it is almost a necessity; and the quantity a laborer can eat of it with impunity, where meat is forbidden by its high price, would surprise one who simply takes a crumb occasionally with the final course of an excellent dinner.....

WHY milk should net the farmers about Philadelphia, three cents per quart while producers in Orange Co. N.Y., get from one-and-a-half to two, is one of these latter-day problems which the local farmers cannot understand. To our minds, it is in both cases, the result of organization—compact and strong. Near Philadelphia it is the farmers who are thus organized. In this section, it is the Milk Exchange, not the farmers, and the result is seen in the different prices that prevail.....

IT is a pretty sure sign of a good farmer when we see a field of green rye from which daily cuttings are being made in May, says the New England Farmer.....

THE Farm Journal—the little monthly that has a lot of imitators but no equals—says that there is no way a farmer can improve a field faster than by seeding it down and pasturing hogs in it—unless it is to sow peas in a lot and then let the hogs eat them on the ground. A pint of corn fed to a hog every day in a clover pasture will make it fit for killing before cold weather. Two quarts of middlings a day wet up and fed to a hog, wintered over, in connection with good pasture, will make it ready for the market in the Autumn. In this cheap way the hogs may be fitted for market early, and the land fitted for a good crop of corn the next year. The shut-up system of making pork, is mighty poor economy. The hogs will do a good deal for us if we only give them a chance.....

A WRITER in the Fruit Recorder pours a pint of kerosene upon a barrel of coal ashes, mixes and uses it the same as he would lime or plaster. The smell of kerosene keeps all insects away from squashes, melons, etc.....

HOW much farther can we go in the direction of breeding for specialties before nature will give an imperative command to halt, asks the Live Stock Journal. We have run some of the beef breeds to the point of barrenness, if not of a diseased tendency to lay on fat. We have done the same with the hog, and in some instances bred off the snout, which nature intended for a purpose.....

RAPID milking is an advantage, says the above journal, if it is done without hurting or irritating the cow and she is milked clean. If not milked in a reasonable time, the cow refuses to "give down." If made to feel comfortable, she just stands and "pours out" the milk. The rapid milker has the advantage. How long ought it to take to milk a cow? Ordinarily about six minutes. A good milker, with good cows having no impediment in the way of rapid milking, ought to milk 10 cows in an hour. Some can not milk over eight, while others can milk twelve.....

WHITE Wyandottes, it is said, will have a boom as soon as the breed can be fixed and multiplied. But what advantage they will have over the original Wyandottes remains to be seen.....

CROCKS of butter to be kept for several months, says the U. S. Dairyman, should never be placed upon the cellar bottom. This causes two degrees of temperature in the crock, which will be at the expense of the quality of the butter near the top. The crocks will keep their contents far better if placed at least a foot from the cellar bottom, upon a bench and a thick woollen cloth thrown over it.....

THE Science News mentions that a crock of butter was lately taken out of a well where it had lain 50 years, and found to be solid and sweet.....

THE Dairyman quotes Prof. Sweet as recommending that butter be salted with a mixture composed of one pound of white sugar to three pounds of fine salt, using one ounce of this mixture to a pound of butter...

DR. VASEY, Botanist of the Department of Agriculture, says that a hand-book of Northern farm grasses will probably be issued at Washington during the coming Summer or Fall. Let us pray, says J. B. Olcott, that some observing farmer may have a hand in it.....

A WRITER in the London Ag. Gazette gives the cow her dues. The Hindoo worships the cow, and the Irish peasant lives with her on a footing of social equality. She is the friend of man in every zone, a peace-offering from Nature to the human race in all climes.....

THE cow converts millions of tons of herbage every year into the richest food for man. Although the scale of animal existence is almost infinitely graduated, the cow is the chief connecting link between human life and the earth that supports it. She is man's forager and nurse after he quits his mother's breast till he drops into the grave. Her patient churning mouth is always going as if she was aware that millions are depending on her for their most wholesome luxuries, as well as for nearly half their sustenance.....

REST a short time after eating, and the hotter the weather the longer the rest. Eat slowly and masticate the food thoroughly. It does not so much matter *what* we eat as *how* we eat it. Do not eat too much.....

MR. HALLADAY says, in the Poultry Keeper, that there are a few persons who sell knowingly Black Cochins for Langshans, but there are more who sell the same through ignorance, having purchased in good faith what they supposed to be Langshans.....

MR. P. M. SPRINGER and Mr. D. L. Thomas are engaged in a discussion as to whether hog cholera is or is not contagious. The latter in proof of his belief that it is not, publishes the following letter from M. W. Smith:

COLUMBUS, IND., Jan. 20, 1886.—I have been engaged in rendering dead animals for fifteen years, and I am proprietor of three factories located at different points. Since I commenced the business not less than 300,000 to 400,000 hogs and pigs have been rendered at my factories. They died from all kinds of diseases that hogs are afflicted with. In the meantime I have kept hogs and raised pigs each year, and they ran in the lots that inclosed my factories and had free access to the offal and ate the liver and lungs of hogs that had died from every variety of disease; and during all that time I never had a case of "hog cholera" among my stock; but my hogs have always been uniformly and uncommonly healthy. They have every possible chance to contract swine diseases, but have escaped. Scores of men living near my factories will attest these facts.....

PROF. W. A. HENRY wisely tells the farmers of Wisconsin that train loads of bran cross that State from Minnesota to be fed out on the Eastern farms. It should be dropped on Wisconsin farms, fed to cattle and thus changed into beef, butter, cheese and manure. Dakota and Minnesota will grow poor from this constant grain production, but Wisconsin by tapping this stream of bran can grow in wealth and fertility .....

THE presence of any thoroughbred cow in a herd has a most remarkable effect upon the

owner, says the American Dairyman. She gets all the petting. Her milk is set in a separate place for family use. When she has a calf, everybody must go out to see it. She has a refining influence in the family. Strange that a man must be taught manners by a cow.....

SOMEBODY having invented a milking stool that shuts up when the cow kicks, the Norristown Herald suggests that it is now in order to produce a milker who will shut up when the cow kicks.....

DR. HOSKINS says that the eyes of any Vermonter can daily confirm the fact that the Morgan blood has not "gone." The perpetuation of the Morgan horse is merely a question of public demand. Of late Morgans true to type seem to be on the increase.....

THE N. E. Farmer states that in many New England manufacturing villages, some of the poorest paid operatives use large quantities of lard instead of butter. It is spread on the bread the same as butter, and then sprinkled with salt.....

ENGLAND is troubled, not only with bogus butter, but with bogus meat. Large quantities of imported beef are sold as prime English beef. The Government will take measures to stop the practice.....

PROF. JAMES LONG has fully satisfied himself that a butter-making dairy farmer is doing himself great injustice in using the old practice of skimming when he could secure a separator. From 669 pounds of Shorthorn milk passed through a separator he secured 36 pounds of butter, or one pound for every 18.5 pounds of milk. From 274 pounds of Jersey milk, set in shallow pans, he obtained 9¼ pounds of butter, or one pound to every 29.6 pounds of milk. It is generally admitted that skim-milk from the separator is decidedly thinner in quality than that from the pans....

SHEEP-WASHING is coming to be less practiced in this country than ever before. Many good sheep men have abandoned the practice, and many of our agricultural papers are outspoken against it. The National Live Stock Journal, among other arguments against it, says the sheep themselves, could they speak, would vote unanimously against the practice. To this English sheep men reply that this latter argument is entitled to as much as, and no more, consideration than the objections of a dirty boy when he is about to be washed in a tub. The washing does the boy good, and, if done at the proper time, the sheep is helped by it.. .....

Everywhere.

TRANSCONTINENTAL LETTERS.—LIV.

MARY WAGER-FISHER.

Through the Willamette Valley; Eugene; Oregon fossils; immigration fever; the Umpqua Valley; Roseburg; Rogue River Valley; Oregon hotels; Ashland.

IN continuing our journey southward from Portland, we traversed by rail the same route through the Willamette Valley that we passed over about a year ago, but being nearly a month later in the season, and the weather perfectly clear, the scenery was considerably finer, the autumnal color being more intensified. I doubt if there is a more charming valley in the world in point of natural beauty, and it is large enough for many, many times its present population, which is scattered over too large farms, and ignores to a painful degree the value of attractive home surroundings. We had been told at the headquarters of the Oregon and California Railroad, over which we rode in this valley, that if we desired to see the entire route through to Ashland—the present terminus of the road—a point 16 to 20 miles from the line dividing Oregon and California, by daylight, we could do so by riding in a freight train from Roseburg, and that such a train with a passenger coach attached, went over the road once every four days; so in leaving Portland we arranged our trip to meet this train, but on our way we learned by a telegram that the train would not move for four days later, which left us with that much time to dispose of, and we concluded to stop at Eugene and see Professor Condon, of the State University, to whom we had an introductory letter.

Eugene, to my mind, is the prettiest town in the valley in point of location and surroundings, and Oregonians themselves take pride in Eugene, and call it "nice." Because of the State University being here, many farmers and others have made it their home for the purpose of educating their children. Prof. Condon has a fine and very interesting collection of fossils chiefly found in Oregon, and most of it is housed in the University. He has some choice specimens, however, at his residence, among which are the jaws and the bones of a fore leg of a now extinct horse, which in its day was only about 26 inches high. The teeth are perfect, and show the little horse to have been five years old. Another petrification of recent date is the toe of a stocking—the foot of the stocking filled with mud which stuffed it out as if a foot were in it—and the petrification is so perfect that every detail of the toe is as apparent as in the real thing—it was a *woven* stocking, and the top and bottom were joined together by sewing. He has bones of camels found at the foot of the Blue Mountains, twenty feet below the surface of the ground, and of the rhinoceros. Fossilized sea shells are exhumed in great quantities about Eugene, but it is evident that the sea receded from Oregon at a later period than it did from Iowa, for example. One curious thing in his collection is the face of a baboon carved in stone, and unmistakably the work of Indians. It was found in the sands of the Columbia River, but where had the Indians seen a baboon? Anent fossils, there is in the Scientific Museum at Seattle a petrified egg, the shell, albumen, and yelk being perfectly defined.

The hotel where we stopped while at Eugene, was kept by Pennsylvanians, who had lived 10 or 12 years in Southeastern Kansas where the husband's health was affected by the alkali water, and wife and children were charged with malaria. There is some malaria in the Willamette Valley, but the Pennsylvanians like Oregon better than Kansas. As we meet with many Pennsylvanians on this coast, the question often arises, why so many people leave that magnificent State of such varied resources, and with thousands of acres of still unutilized land, and go "West." Nothing explains the matter, probably, better than the restlessness inherent in the American—the inborn as well as educated tendency for "pastures new;" for the majority of people will do vastly better in the good old State of William Penn that they will anywhere west of it, all railroad and real estate agents advertising "to the contrary, notwithstanding:" what is gained in one direction is offset in another, as a rule. But I would not, under any ordinary circumstances, live in a malarious region, or where the drinking water is unwholesome, for there is no financial profit to be named under the sun worthy of the sacrifice of health.

After a day at Eugene, we went further south, as far as Roseburg, where we again halted for a couple of days. The railroad, after leaving Eugene, soon enters the Umpqua Valley, which is narrower than the Willamette, and the scenery becomes gradually more and more like that of Northern California—mouse-covered hills, smooth and sleek, save for their setting of russet clumps of scrub oaks, the yellow of the wheat stubble fields; but not a green field to be seen. No rain has fallen for weeks, maybe for months, and the grass is as brown as the Buffalo Grass in Colorado in Summer. This is quite a valley for sheep. Some fields of unpicked hops were noticed, an occasional farm house was snugly nestled in an orchard of fruit trees—a picturesque country with the land lying in billowy mounds, and the streams bordered with deciduous trees in their full dress. At one point we saw a deer swimming the Umpqua River, and a passenger quickly drew out a revolver and from the car window discharged two shots at the pretty creature, which luckily did no harm. The deer are said to be quite a nuisance to farmers by their trespassing, but the deer undoubtedly regard the farmer as a greater nuisance.

Roseburg is a pretty little town in the mountains, with some good buildings, and while it was the terminus of the railroad it was of some considerable importance, which it has now in large part lost. An easy-going, elderly woman at the hotel told me that she crossed the plains in an ox team in 1853—being six months making the transit. She said that then the native grass in the Umpqua Valley was breast-high, and that it was predicted that it would never give out, and California herders drove their cattle there for pasture, but the prediction had sadly failed.

The road from Roseburg to Ashland was through territory new to us, and there was more to note. The country became drier and when we reached the Rogue River Valley, the products of the land were of a more valuable character. This valley has been greatly extolled for its excellence, and it has some fine farms well tilled and set with attractive homes. Here flourish peaches, grapes, melons, apples, pears, plums, corn good in quality, but small of stalk, more wheat and oats than other grains, an occasional bevy of cattle and horses—improved farms worth from $20 to $25 per acre. Here the Black Oak succeeds to the White Oak of the Willamette Valley—the former I am told indicates an older country. The railroad runs all the way through mountains in which are set pretty little valleys—a road costly to build, of many tunnels, but excellently built. All along this region there is more or less mining for gold, as there is gold in the mountains on this coast from Patagonia to Alaska. We had for fellow passenger an Ex-Governor of Oregon, who detailed a number of thrilling incidents connected with Indian hostilities—now happily at an end—of the marvelous heroism of women, whose deeds had they been enacted on the soil of New England would have become historic themes. He was a man of marked kindness, as we had abundant evidence in his attentions to a sick and aged woman to whom he was under no special obligations, and the kindness of Oregonians to such as are sick or in trouble, is proverbial. One would suppose that people who had the energy to cross the plains in an ox team, as so many of the early settlers did, would have had enough energy left over to be manifest unto the present day. But for the most part, it was expended in that one stupendous undertaking. The Ex-Governor gave us, from his wife's lunch basket, some dried elk meat, which he pronounced the most nutritious and digestible of all dried meats, and we found it delicious.

We passed no towns of especial note in the later part of our journey,—Gravel Pit, Jump Off Joe, Grant's Pass, half mining towns, and the people about the stations dressed in a back-woodsy fashion—both young men and women in high-heeled shoes, the latter with dangling ear-rings, bangs to their eyes, and skirts distended with hoops. We reached Ashland early in the evening, and getting into the only 'bus at the station, were taken to the White Sulphur Springs Hotel, where we found a very good table, but a shabby room. We have been in many and various hotels in different cities and towns in Oregon, usually at the best hotels, but taking them all in all, they are of inferior character, and far from being "first-class" in the Eastern sense, and even in Portland the residents say that the great need of the city is a first-class inn. We found a number of hotels without a bar for the sale of liquors, and there seemed to be a healthy and effective temperance influence prevailing; but considerable gambling was reported. At Ashland we slept for three nights, indulging in this delay for the purpose of securing the choice outside seats on the stage—a matter of importance as we had before us a stage ride of 125 miles before reaching Delta in California, where we could again board a railway car. In Ashland we found almond burrs full of ripe nuts, great quantities of dahlias, roses, petunias, and chrysanthemums in strikingly luxuriant bloom. It was October 25. The town has a large woolen factory and a fur-trading room under the auspices of the W. C. T. U. and only two poorly patronized saloons. It is surrounded with mountains, wooded on one side, and nude on the other. On Sunday we attended church where a most uninteresting man who had never been called to preach, talked distressingly through his nose, and where the atmosphere was so hot and close that had I been a "fainting female," I should have fainted, as my piety is very partial to a fresh supply of oxygen, and plenty of it.

RURAL SPECIAL REPORTS.

Alabama.

ATHENS, Limestone Co., June 7.—We had a backward and cold Spring, therefore farm crops and fruit are late. Wheat is being harvested this week; but little is raised through Northern Alabama. This year's crop is rather above an average in yield, but the acreage is less in this locality. Corn and cotton look well. Apples, peaches and plums are good half crops. Small fruits are fine: mulberries and blackberries never fail. We do not need cultivated blackberries of extra varieties here—the wild ones far surpass any I have seen in the Northern States, and wild mulberries are 1¾-inch long and as large around as one's finger. My Angel of Midnight Corn is in tassel and my Bird Cantaloupe is in bloom.

W. M.

Illinois.

MONMOUTH, Warren Co., June 12.—The weather has been very dry and sultry for the past three weeks. Corn looks well, but oats and meadows are needing rain badly. The strawberry crop is short, and unless we get rain soon it is said that the entire berry crop will be a failure. I have never seen pasture as good as it has been this Spring, but this dry weather is very hard on it. J. K. S.

Iowa.

OSAGE, Mitchell Co., June 9.—Vegetation is forward, but crops are not unusually in advance of the average season. Produce is lower now than ever before since the war, or perhaps it never reached so low a point here. Eggs are quoted at 6½ cents a dozen; wheat, 40 and 45 cents; barley, 28 cents; oats, 21 cents; corn, 22 cents; rye, 35 cents; flax, 75 cents; potatoes, 20 and 30 cents; butter, unsalted, 6 and 8 cents; choice dairy, 10 cents; stock—fat cows—$2.50 per cwt. The continued rains during early planting season will cause both light and late crops. In some localities quite a drought is prevailing. We are longing for "showers of blessing." L. S. E.

Kansas.

BEATTIE, Marshall Co., June 11.—Corn all planted and cultivating has begun. Stand good all round. Oats look bad on account of the hard drought; heading out, though not over 12 to 14 inches long. Clover good—just ready to cut for hay. Hog cholera has been a plague here for about a year. No remedy has been of any use. Thousands have died. I have lost over 100 head since Christmas.

"SUBSCRIBER."

Kentucky.

PEMBROKE, Christian Co., June 10.—Peaches a complete failure. I failed to find a single bloom in this section. Worse, the trees are, most of them, dead—a few green branches amid a mass of decaying limbs. A temperature of 20 degrees below zero is evidently fatal to the peach. One of the largest nurseries has dug up all its peach trees planted for sale, and burned them on the plant bed, as the proprietor could not afford to put such diseased specimens on the market. Pears almost a failure. Apples a fair crop. Grapes not much injured. Wheat unusually promising. It was protected by deep snows during the severe weather; prospect good for an unusually good yield and quality. Tobacco ruling very low; prices not satisfactory, but it will be extensively planted again, simply because we can find no substitute for it. Our farmers would like to abandon tobacco, but money must be had, and with necessity as a stimulus and custom as a force, we are bound to continue raising a crop that is ravenous in its demands for the very best food, and whose gluttony leaves little for the next crop. Worst of all, nothing is ever returned to the soil from the tobacco crop.

J. D. O'B.

North Carolina.

HIGHLAND, Macon Co.—I find it in every way delightful here, excepting that living is somewhat rough and the bill-of-fare is rather scant at this season. Just like the South everywhere, it is a hand-to-mouth system, no prevision, no provision for the future, and a waiting on Providence or time and season for everything that is wanted; and so in the Spring we have to wait for the skeletons to get fat before we have any beef, and the grass to come up before there is any butter. I am the only man, I guess, in the South who has a barn full of hay on hand and has kept seed corn fit for seed. Corn planting has been done two or three times over, because the seed has been left to soak on the stalk and got frozen in the cold spell; and yet every one takes it easy and is happy. C. S.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

EVERGREENS FOR KANSAS AND THEIR TREATMENT.

"Subscriber," Washington, Kan.—1. What varieties of evergreens do best in Kansas? 2. How should evergreen seedlings from a nursery be planted, shaded and cared for? 3. What kinds are best adapted for topiary work—cutting into different shapes?

ANSWERED BY PROF. EDWIN A. POPENOE.

1. For a short list of evergreens that may be planted in the eastern third of Kansas, in expectation of fine growth with reasonable care, I should name the Red Cedar, the Austrian and Scotch Pines, the Norway Spruce. Add, by way of experiment, the American Arbor-vitæ, the White Spruce, the White Pine, the Douglas and Engelmann Spruces of the Rocky Mountains, the Dwarf Mountain Pine, the Table Mountain Pine, the Yellow and Pitch Pines of the Alleghanies, and you have a sufficient variety for ordinary lawn planting. All of these are successfully grown at the college here. Our experience with the retinispora and the various junipers is not sufficient to warrant conclusions, though several species among them promise well. The same may be said of various fancy Arbor-vitæs that we are now testing. 2. In handling evergreens of any size the chief care is to keep the roots moist until planted. This is a matter of special importance here where we may have to handle them during a drying south wind. They should have the roots "puddled," or dipped into a thick mixture of stiff soil in water, as soon as they are unpacked. If a

delay of even a few hours is necessary before planting, the trees should be "heeled in," or the roots well covered with damp earth. If the smaller-sized seedlings are to be cared for, they are best set in beds, and protected from the heat and dryness of sun and wind in midsummer by screens of lath, which may be shifted or removed as occasion demands. It is cheaper to procure trees several times transplanted in the nursery, unless the purchaser is skilled in tree culture. 3. Shearing trees is an unnatural practice, and in bad taste, unless in a hedge where a formal shape is admissible. The close-growing sorts, like the Red Cedar, the junipers and the Arbor-vitæs, are alone adapted to such modes of training; but the tree lover prefers to bring out their peculiarities rather then to bring all down to the same or similar set forms.

Ag'l College, Manhattan, Kans.

THE CUT-WORM LION.

J. N. L., Haw Patch, Ind.—I send a specimen of an enemy of the cut-worm, which will kill more than a lazy boy. What is its name?

ANSWERED BY PROF. A. J. COOK.

The insect is the grub of one of our most valuable predaceous insects—Calosoma calidum. It is black with a horny back, and it needs this shield, as any one may readily believe who sees it attack a savage caterpillar much larger than itself. Like most larvæ of beetles, it has six-jointed legs just back of the head, and two caudal horns, resembling jaws, at the opposite end of the body. The mature insect is one of our most common and handsome ground beetles. It is black with three rows of silver or gold-colored spots along the back of each wing cover. Both the grub and mature beetle are worthy of our regard, as both feed extensively on our worst insect pests. This grub is sometimes called, with good reason, the Cut-worm Lion. It is very exciting to see one when hungry attack a cut-worm. Though the latter may be much the larger and stronger, the hungry grub fearlessly fastens its jaws into its prey, changing its hold till it secures a position in which it is safe from the strong jaws of its victim, or at least such a position that the cut-worm can bite only the horny back of its destroyer. The stronger cut-worm will turn over, writhe about, twist around, and double up, and yet all the time the fiery grub will maintain its hold, evidently sucking the blood from its prey, as proved by its own increasing size, and the rapid diminution of its victim. In about five minutes the discouraged cut-worm gives up, and is then soon despatched by the triumphant, but no longer hungry, grub. There is something wonderful in the economy of Nature as seen in the way by which the balance is maintained. Last year the cut-worms were terribly destructive in Indiana and Michigan. This, of course, gave plenty of food to these Cut-worm Lions, and so, of course, they prospered with exceeding prosperity. So we may hope, with much reason, that the cut-worms will do far less damage this year. With the cut-worms thinned out, the grubs will fail of food, and soon will be far less in numbers. Then our enemies, the cut-worms will again thrive. And thus we study the marvelous relations of life on the globe.

KEEPING AND USING MANURE.

J. C. V., Fort Scott, Kans.—How is manure best kept through the Summer for use on Fall crops? 2. Which is better—to manure in the hill or broadcast?

ANS. 1—If in barns and trodden quite compact, manure will keep nicely; but it should not be allowed to become so hot as to burn. This may be prevented by a liberal use of water; but the better way for the majority of people and circumstances is to draw it out and put it into broad piles, or it may be piled in the yard. In either case it should be put into broad piles, the outside all round being kept a little the highest so as to cause all the rain falling on it to run into the pile. It is well to mix with it plenty of vegetable matter, such as straw or seedless weeds or any spoiled hay, and also to mix the manure from the horses, cows and other stock well together, so as to have an even grade. If there is too large a proportion of horse manure, it would pay to put over the pile, while building, an occasional layer of muck or other rich soil—good rich prairie soil is good—so as to prevent so rapid a fermentation as to cause fire-fanging. After the manure has all been placed in the piles, a thin coat of soil over them will greatly retard fermentation and also arrest any escaping ammonia. If the manure gets hot, it will also pay to apply water, if convenient, in quantity sufficient to moisten the pile and thus control the fermentation. 2. There is no doubt that the plants to which manure is applied will take up a larger proportion of the fertility when it is applied in the hill, and particularly so when only a limited quantity is to be used; but such application has a tendency to forward the crop while young, and to starve it later, so that broadcast manuring is quite as satisfactory. One thing should be always kept in mind: manure gives the largest returns and is most satisfactory when mixed with the surface soil. In no case should it ever be plowed in deep.

SILAGE A YEAR OR TWO OLD.

E. A. B., Talladega, Ala.—What can be said of the quality and feeding value of silage kept over one year in the silo? My silo was filled last year; but not quite half was used, and the remainder is still in the silo. The end exposed to the air will, of course, be spoilt; but will that in the center? The weight of stones has never been removed from that part.

ANS.—There are several well-authenticated records of corn silage kept in this country, in sound and palatable condition, for more than a year. Well packed and pressed and left undisturbed, particularly if in a masonry silo underground, so the temperature varies little, there is no evidence contrary to the belief that silage can be kept for an indefinite period. In this special case we do not hesitate to express the opinion that the bulk of the remaining silage can be kept unimpaired for another year. There will undoubtedly be a total loss of the material on the face of the exposed surface, extending into the mass from eight to twelve inches. If above ground, and exposed to varying temperature, the decay may penetrate farther. If the empty half of the silo should be filled this season there would probably be a loss of an equally thick section of the new material where it joined the old. But this could be largely avoided by a partition of boards set on end and fitted tightly against the bank of old silage. Without this there might be difficulty in the new lot settling evenly on the side next the old. A friend writes us that within a few days he has examined silage in good order in silos in the Carolinas and Georgia, which gives every indication of keeping well for months to come.

FORCING A PIG.

H. C. K., Blodgett's Mills, N. Y.—What is the best grain ration for a Spring pig to give the greatest weight by December 1, in addition to all the milk it will drink? Which would be the better—keep it out-of-doors or on a floor?

ANS.—By all means put the pig out-of-doors where it can get grass. Let it have a bed sheltered from the hot sun and rain, and the range of a pasture. The exercise will give it an appetite which may be aided by allowing it to have all the charcoal it will eat. This may be kept in a box and in another there should be a mixture of salt and sulphur, where piggy may take a lick whenever he desires. These helps will keep the stomach in good order. Mix fine wheat middlings with the milk, and allow this swill to get slightly fermented. When the pig is two months old, put in one-fourth of corn-meal, and when it is six months old make the meal part of the food one-half corn-meal. Barley meal is excellent. Wheat bran may be mixed with finer food. There must be course and fine food to keep up a perfect and healthy working of the bodily functions. All fine feed will make a disordered stomach and fever, and all coarse will not furnish sufficient nutrition for the blood to make a rapid growth. A grown hog may be fed all corn, for its body is already grown.

INCREASE OF CATTLE.

F. M. Ashtabula, Ohio.—If I let out, on shares, a heifer with a calf by her side, and she and her offspring have calves every year on April 1—just the day the first is two years old—how many head will there be in all within the five years?

ANS.—These would be most remarkable cattle to have heifer calves with such regularity, but if they did, and none of the calves died, the answer may be figured out. The start would be made with two animals. At the end of the first year the heifer would have calf, thus making three animals. At the end of the second year both the cow and her first calf would have calves, thus making five animals. At the end of the third year calves will be dropped by the cow, a three-year-old and a two-year-old, making eight animals. At the end of the fourth year calves come from the cow, a four-year-old, a three-year-old and two two-year-olds, making 13 animals. At the end of the fifth year additions are from the cow, the original calf, a four-year-old, two three-year-olds and three two-year-olds, making a total of 21 animals.

Miscellaneous.

J. T., Gusenaw, W. Va.—1. Would it be advantageous to mix muriate of potash with stable manure, the same as kainit? 2. Would it be advisable to mix bone-meal and lime together; or what form of phosphoric acid would do well on land which has had a heavy dressing of lime within a year, as I see some object to using superphosphate on limed land on account of its reverting? Would the lime be detrimental to floats, or undissolved South Carolina rock, on such land? 3. Which is the better feed, all things considered, prices being equal, cotton-seed meal or new-process linseed meal?

ANS.—1. Yes, if your land is poor in potash. 2. No. There is nothing to be gained and something to be lost. If you wish to lime land, spread it alone. Use bone, that is, raw bone flour. Any kind of soluble phosphate will revert when there is plenty of lime in the soil. But the reverted acid is nearly as valuable as the immediately soluble, because that reverts in a short time. 3. Cotton-seed meal.

A. P., Highland Falls, N. Y.—1. How is Boston Lettuce raised? 2. How can I get mushrooms to grow in my fields? They do not seem to be indigenous here.

ANS.—1. The Boston Market or White-seeded Tennis Ball is a small, solid-hearted variety, excellent for use between November and May, but of no use in Summer. Boston-Curled is a pretty-appearing lettuce, but not, in our estimation, of fine quality. Lettuce likes rich, mellow, moist soil, and to have it crisp and tender it should be grown quickly. 2. After a soaking rain in August plant pieces of fresh brick spawn, about the size of an egg, in the field, and some two or three inches under the sod. But even then there is no certainty that mushrooms will grow there.

J. B., Pittsburg, Pa.—Some of my pear trees, standing in grass and not manured for some years, are very full of fruit. The grass will be cut early in July; what would be a quick-acting fertilizer to scatter around the trees to help them to produce large fruit?

ANS.—We should not do it. It will be too late, and might only serve to start the trees into a late growth, which would be killed by the Winter. Again, we should not apply soluble nitrogen alone, and if at all in the Spring. Then it would be better to use the nitrogen with wood ashes, sulphate or muriate of potash and bone.

H. M., Wyanet, Ills.—The horse collars should be kept clean and soft. Of course, no man will drive a horse with a collar that does not fit. Scrape the dirt away from the leather and beat it frequently with a stick. Oil the leather at intervals. Where the collars are kept as they should be, we do not think sweat pads are necessary. Write to the Commissioner of Immigration, Des Moines, Iowa for information in regard to lands.

G. E. B., Waynesville, Mo.—Probably the most practical way to remove the stumps would be to dig them up by the roots. We do not advise experimenting with explosives unless one is accustomed to their use. In some localities parties make a business of blowing out stumps, and can thus do the work cheaply and effectively. Dig a ditch around the stump, and with axe and grub-hoe cut off all the roots you can reach. A good team can then pull the stumps out, and the hole can be filled

F. W., Neenah, Wis.—For an account of the Norfolk and Suffolk Red Polls, see RURAL of May 29. Yes, they are excellent general-purpose cattle. For milk and beef combined, they are probably as good as, if not better than any of the other pure breeds. While the improvement of the "poor man's cow"—the cow for the man who keeps only one—is greatly to be desired, it is a trifle doubtful whether it would be worth while to produce a general-purpose cow, or whether one could be produced in any case.

W. F. K., Clinton, La.—Of the grasses sent for name, No. 1 is Lolium perenne, Italian Rye Grass. Early maturity and rapid growth after cutting are its leading characteristics. All animals are fond of it. It is valuable for green fodder or hay. It is very nutritious. The second is Cheat or Chess—of no special value.

G. M., Wingham, Ont.—The Japan Quince is propagated by cuttings, by offsets and grafting. Grafting on the Japan Quince. It makes a curiosity to graft the white, red, dark-red, etc., on one plant.

DISCUSSION.

H. H., KINGSTON, N. Y.—I must differ from Mr. Taplin with regard to what he has said in a late RURAL, about the out-door behavior of the La France Rose. It is a grand success in my garden, and what a charming rose it is! If not really at the head of the cutfre list, it is surely second for beauty, size and fragrance. Mr. Fish, the distinguished floral writer in England, pronounces it the best of all, without hesitation. Who can name its superior? This sweetest of all roses was raised by Guillot the younger, and was first sent out in 1867. I find that roses do nicely in moist soil. I have a bed along the border of which flows a gentle rivulet from a cool spring. The soil remains wet all through the year, and the roses grow with exceptional vigor, blooming profusely. Of course, the drainage is free and ample. What a field of labor is presented to the progressive nomenclateur by our rose list. Large plant dealers will soon need to run special lumber yards with cutting and planing machines to supply their labels.

THE USE OF SALT AGAIN.

L. C., PHILADELPHIA, PA.—I note what the RURAL says in a late issue about the use of salt. The writer's remarks show plainly that he really never studied the subject, and that it is all guess-work. My conclusions are quite different from those of the RURAL. I looked into the subject myself a couple of years ago, and came to the conclusion that the habit was not only an unnecessary but a bad one, and so I quit it with results completely satisfactory.

R. N.-Y.—The alleged "guess-work" indicates the opinion of the scientific and practical world on this subject more correctly than do the "conclusions" of our friend. It may be, however, that immemorial belief and practice in the matter have all along been wrong; but it will take more than the opinion and experience of any single person, or indeed of any hundred persons, to convince the world of the blunder. The subject is well worthy of discussion, however, and our columns are open to anything valuable our friends may have to say on either side of the question. Contributions from our medical readers would be especially acceptable, and we trust our highly esteemed contributor, L. C., will also favor us with the reasons "for the faith that is in him." We have already anti-liquor and anti-tobacco agitations; are we to have an anti-salt agitation also? All the RURAL wants is to draw forth "the truth about it."

That Tired Feeling

The warm weather has a debilitating effect, especially upon those who are within doors most of the time. The peculiar, yet common, complaint known as "that tired feeling," is the result. This feeling can be entirely overcome by taking Hood's Sarsaparilla, which gives new life and strength to all the functions of the body.

"I could not sleep; had no appetite. I took Hood's Sarsaparilla and soon began to sleep soundly; could get up without that tired and languid feeling; and my appetite improved." R. A. SANFORD, Kent, Ohio.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

CHINA-LINED

ICE PITCHERS.

The Linings of our Pitchers are held in position by the Cover, which is secured by thumb-screws and is easily removed and replaced, thus facilitating the cleansing of both pitcher and lining. The lining is of the finest Stone China, and has no equal for preserving ice and keeping water pure.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, JUNE 26, 1886.

Of 20 different (?) kinds of oats growing at the R. G., White Belgian, Clydesdale, Badger Queen and Welcome are the first to "head out." With the exception of Badger Queen, which, under that name, at least, we have never before tried, we believe, and have so stated, them all alike. Our object in again raising them side by side is to enable others to judge whether we were correct or not.

It is probably true that the disease known as "gapes" kills more chickens than any other. Most of the remedies offered are uncertain, such, *e. g.*, as obliging the ailing fowls to inhale lime dust and tobacco smoke. Will kerosene kill the worm which causes gapes? Will it kill the chicken if a drop of kerosene be dropped in the trachea? We can answer "no" to the latter question, and from a single experiment we are inclined to say "yes" to the former. The writer dipped a very small feather (about two inches long) into kerosene, and then carefully pushed it down the windpipe, carefully turned twice or thrice and then withdrew it. The chicken which had the gapes recovered in a few hours. The experiment is worthy of repetition.

Many of our readers will remember that upon the half-acre of poor soil on which we attempted to test the value of the Rural's trench-mulch system of raising potatoes, a large amount of chemical fertilizers was sown, both broadcast and in the trenches—enough we should suppose, so far as potash and phosphate of lime were concerned, to last for half-a-dozen crops. The field was sown to rye. The crop is a good one, but no better than the rye of neighboring fields. This Spring, as has already been stated, high-grade nitrogenous fertilizers were sown at the rate of 100 pounds to the acre, except upon a strip 10 feet in width. The color of the rye of that strip is and has been lighter, but it promises to yield about as well. Why this half-acre does not yield a great deal more than the other parts of the field also in rye is what we can't understand.

The American Association of Nurserymen, Florists and Seedsmen met at the Agricultural Department Building, Washington, D. C., last Wednesday and Thursday. The list of the new officers elected is given in our news columns. A strong effort was made to elect Herbert Myrick as Secretary instead of D. Wilmot Scott, of Galena, Ill., who was re-elected. A great lack of system and proper arrangement marred the meeting, which resembled an assemblage of school boys for fun, rather than a convention of men for business purposes. From 400 to 500 members were present, and 27 States were represented by vice-presidents. Many had traveled long distances, and it was hardly worth while to go to so much trouble and expense of time and money to learn so little. The young members who hoped to learn something which would be of use or profit to them on their return home, were especially disappointed. One good thing the Convention did—and that was outside its legitimate business—it passed a strong resolution in favor of the Oleomargarine Bill now before the Senate.

Wednesday last Chairman Morrison, of the House Committee on Ways and Means, made an adverse report, on behalf of the Democratic majority, on the resolution to restore the wool tariff of 1867, as desired by the wool growers of the entire country. He takes the old ground that the tariff of 1867, enacted "in obedience to the clamor" of the flock-owners of the chief wool-growing States, lessened the production and lowered the price of wool, and insists that putting wool on the free list would increase the production and price of the staple, while affording cheaper fabrics to the consumers! No attempt is made to explain this marvelous phenomenon so diametrically opposed to the acknowledged results of protection in other industries. If free trade in wool increases the price of the home-raised raw material, how can it at the same time enable the home manufacturer to turn out cheaper goods for the consumer? Does not the cost of the raw material have much to do with the price of the finished product? Representative McKinley's report, on behalf of the Republican minority of the Committee, is a convincing reply to the specious reasoning of the majority's report. The subject has been largely discussed in our columns already, and as tariff legislation during the present session of Congress, is rendered highly improbable by Thursday's vote in the House, further discussion of the question will be more appropriate when it comes up again in Congress, probably during the next session.

Twenty-six United States Senators are the direct owners of individual and corporate property amounting to $100,000,000, and 22 of them are agents for corporate monopolies, chiefly railroads, the property of some of which is now legally forfeitable to the Government, and they have to legislate as Senators on questions which they are paid to support as lawyers. In view of this disgraceful state of affairs, Senator Beck, of Kentucky, the other day introduced a bill forbidding, under heavy penalties, Senators or Representatives acting as attorneys for railroads which have received Government aid—land-grant roads—and concerning which, therefore, they would have to act in their legislative capacity. The bill startled and surprised the railroad Senators, and, being obviously fair, was passed before they could plan to defeat it. It was afterwards "reconsidered," however, and still hangs up in the Senate, where it is likely to remain till the end of the session. All the railroad Senators are combined against it under the leadership of Edmunds, who is stimulated to defeat it by pleasant memories of big fees received from the Central Pacific Railroad, and cheering prospects of more to come. Legislative morality, the interests of the public, and common decency demand the passage of the measure; shall it be defeated by shameless, selfish greed?

The Senate, by a vote of 42 to 1, has passed the bill forfeiting the unearned lands of the Northern Pacific Railroad alongside that part of its main line which was to extend from Wallula Junction to Portland, and that part of the Cascade Branch which may not be completed at the date of the passage of the bill, and making the right of way in the Territories subject to taxation. Nothing in the act is to be construed to waive any right of the United States to forfeit any other lands granted to the road, for failure, past or future, to comply with the conditions of the grant. There is no intention whatever of constructing the Wallula-Portland road, yet it was sought by the railroad to withhold indefinitely from settlement the land granted for its construction. The Cascade Branch should have been completed seven years ago to entitle the company to the grant. This is the first of the numerous bills forfeiting land grants, acted on by Congress, and all the railroad lobbies and agents were bitterly active against it. Insidious amendments, nullifying or minimizing its most important provisions, were pertinaciously pressed by the railroad Senators. These were all rejected by various majorities, and when it came to the final vote, Blair, of New Hampshire, was the only Senator with effrontery barefaced enough to go on record against it. A more sweeping bill has already passed the House, so that this is sure to pass as a compromise measure, and if the other land forfeiture bills meet with the same success, over 130,000,000 acres of excellent land now unjustly held for corporations, will be thrown open for settlement under the Homestead Law.

The Senate Committee on Agriculture has been listening to arguments from the supporters and opponents of the Oleomargarine Bill during the week. The main reliance of the latter has been the purchased opinion of scientists with regard to the healthfulness of the product. These examined only choice goods turned out by the best makers—not fair specimens of the product; and who that reads the papers does not know that the highest scientific knowledge is at the command of the best filled purse? Experts say the fat must not be over 24 hours old when manipulated into "oleo;" but there is abundant evidence to demonstrate that much of the fat used, especially in the East, is much older. Some of the highest authorities also say the wholesomeness of bogus butter cannot be proved by chemical analysis, it must be ascertained by its effects on the human system. Senator Miller, Chairman of the Committee, thinks the bill will pass—possibly by 10 majority—but Western Congressmen believe it is in danger of defeat by the votes of the Republican Senators from New England, and some of them declare that if this happens, they will help to take up again and pass the Morrison Tariff Bill, which is bitterly opposed by the Protectionist New Englanders. If the bill shall fail to pass, it will be because the farmers of the country have failed to exercise due pressure on their Congressmen.

The question put squarely before the people of Nova Scotia at the Provincial elections last Tuesday, was secession from the Domion or continued union with it, and by the election of 31 out of 38 members of the new Assembly—an unparalleled majority since the formation of the Confederation, 19 years ago—the voters decided that they preferred secession. The Province has been dissatisfied ever since the union with the Dominion, and her dissatisfaction has increased as her prosperity has diminished. It is charged that when Nova Scotia entered the Union, her debt was $5,000,000, while now her proportion of the Dominion debt is $28,000,000, or over $60 a head for every man, woman and child. The Dominion has incurred vast debts for building railroads, improving canals and developing new country; but while the other Provinces are benefited by these, especially Ontario, the Maratime Provinces derive little or no advantage from them, though groaning under the load of taxation caused by them. The present purpose of the Nova Scotia secessionists is to induce New Brunswick and Prince Edward's Island to join in the movement with a view to the formation of a Maratime Confederation, or, failing in this, to force the Dominion to turn a more attentive ear to the Province's remonstrances for fairer treatment, and to secure Imperial aid in both or either project. Union with the United States would be a final alternative.

MAGNOLIA MACROPHYLLA.

Perhaps scarcely one in a dozen of our readers has seen the flower of the Great-leaved Magnolia (M. macrophylla.) In general appearace while young it resembles the Umbrella Magnolia, though the leaves are larger, obovate, and heart-shaped at the base instead of pointed, and the under part is covered with a dense silvery bloom. Our tree is now about 10 years old and 15 feet high, blooming now, June 10, for the first. The flowers are monsters, of a bell shape and white color; the petals eight inches long, four wide in the middle, tapering towards the base and rounded tip. Thus the flower when spread open measures 17 inches. The petals are in two whorls of three, the inner three blotched with dark purple near the base. They have little odor and that rather unpleasant. This tree is perfectly hardy at the Rural Grounds. It is free of the decided objections to the Umbrella, those of a scraggy growth and tendency to sucker. Unlike that tree also its growth for the first few years is slow, though it compensates for this by a symmetrical form. This tree is found wild in Kentucky and southward, though it is hardy in Rochester, and we know not how much further north. All home grounds need a few large-leaved trees. They give to a lawn the same luxuriant appearance that cannas and caladiums give to the flower border. For this effect we know of no tree more suitable than the Large-leaved Magnolia.

DISCOURAGED FARMERS.

There are hundreds of discouraged farmers in this country. They do not hesitate to advertise their condition. One can hardly blame them. The world looks dark, indeed, to the man who has lost his courage. Courage is fickle; it is hard to win it back when once it is driven away. It is customary to sneer at the discouraged farmer, and tell him that his failures are his own fault. This talk does no good. It only makes a man more bitter to say "I told you so" to him. Such men need encouragement and hope, and not sneers. Many a man who has worked carefully, honestly and well, finds himself no higher up the scale of agriculture than he was a year ago. No wonder the long days of drudgery that lie behind him blacken his prospects now, and magnify his obstacles. We appreciate the position of such a man, but would beg of him, for the sake of his family at least, to keep his courage and cheerfulness. You owe a duty to your family. The strong must uphold the weak. Strength comes only through suffering. When you give up, you give every one of your children a lesson in cowardice. Life is not so bad after all. Your work has not been all in vain. There are plenty of people worse off than you are. Hundreds of these city people who go about with plenty of money, who never seem to be troubled, have a life-long hunger gnawing away at their hearts. Rest assured that some man envies you your lot. You would not sell your own health or the health of your wife and children for any money. The world is better than it might be, friends. Let us make the best of it. Times are going to be better again. Never get so sour and discouraged that you cannot enjoy the good times when they come.

BREVITIES.

The Parry Strawberry June 11 was at its best and yielded well.

We have been trying to make out which of our 66 varieties of strawberries bears the most fruit (June 14). We decided in favor of the Dewey, of which we shall have more to say.

Poor, tired land! Oh, how weary! and how hungry, too! Let our grandsons feed it and rest it, says the tired farmer. We cannot work for posterity. It is as much as we can do to earn our own living.

So, after all the hubbub and bluster, the fishery trouble—that tempest in a teacup—is in a fair way to adjustment, and that, as we said editorially in the Rural of May 29, "through British repudiation of the Canadian attitude."

In answer to inquiries—Any bags will answer for "bagging" grapes. It is a poor bag, indeed, that will not last through the season. Any bag that will hold a pin is good enough. One can make his own bags in a short time by pasting good newspapers together.

In the way of peas, what now seems to be most needed is a wrinkled variety as good and early as the American Wonder, as productive as the earliest, with haulms that grow about two feet high. This is what we are now working for by crossing the earliest smooth peas upon the American Wonder.

We are painting the base-boards of our new chicken yards with tar and linseed oil—mixed half and half. Now, why isn't this a good paint for such purposes? Is not it durable? The pickets may be painted dark-red and, then, you see, our chicken yards will be fashionably dressed after the Egyptian style.

Mr. R. M. Littler has done good work for the cause of pure butter. His bulletins and circulars have contained much fact and convincing argument. They would have been just as effective and a great deal more dignified if the usual poetry had been omitted. To talk about "bleeding sire and son" in connection with oleomargarine will make no converts.

We have received a box of the Henderson Strawberry from the originator, George Seymour, of South Norwalk, Ct. The berries are all large, shapely and firm, measuring over four inches around the middle. It is in quality the best berry *of its size* we know of. It does not thrive at the Rural Grounds, but these berries show how well it thrives on its originator's grounds, and how well it may do under similar conditions.

Oats and wheat are rusting badly in the country about the Rural Ex. Grounds. There has never been a larger crop of strawberries, and the promise of the raspberry and blackberry crop was never better. The early potato crop will be immense, unless the wet weather causes rot. The hay crop will be fine. Peas are abundnut. Rye never looked better. In fact, up to this time it is a season of abundance.

The World moves. There was a time in English history when the farmer was obliged to stand quietly by and watch a party of hunters ride directly over his fields. There was no chance for him to obtain redress. The rich were too rich and the poor were too poor. Times have changed. Farmers are taking steps to prevent this hunting over their farms, and they are meeting with success. Independence is gaining ground and toadyism is failing. We have so-called "sportsmen" in this country. It is difficult to treat seriously of men and women who will chase a bag of anise seed all day over farms and meadows, yet such people are with us. They are harmless enough in their way so long as they do not interfere with the rights of others. When they trespass or commit damage on the farm, they should be treated like common law breakers.

Audacious, fiery, little Senator Van Wyck, of Nebraska, the "Old Van," of his friends, the "Little Wasp" of his foes, has more fun himself and causes more trouble to his opponents than any other man in the Senate. No respector of persons is he. Once convinced a project is right or wrong, he will support or fight it to the bitter end, no matter who may be in the opposite ranks. He will attack the staid, brainy, sarcastic Edmunds just as spunkily as that Midas of the Senate, Sheard of California. Monopolies, and especially railroad monopolies, are to him what a red flag is to a bull—he goes for them every time. What splendid service he did in the late debate on the Northern Pacific Forfeiture Bill. How shrewdly he saw through, fearlessly exposed and adroitly circumvented the schemes of the railroad Senators! And when, last week, the odds looked heavy against Senator Miller's being able to secure the reference of the Oleomargarine Bill to the Agricultural Committee, it was Hot-Spur Van Wyck to the rescue with a speech that stirred up the Senate and delighted the galleries, and after damaging Butler and turning the laugh against Edmunds, lo! the bill was properly referred. May thy watchfulness and courage never grow less, and may more men of thy spirit soon find seats beside thee, plucky Senator from Nebraska!

Horseman.

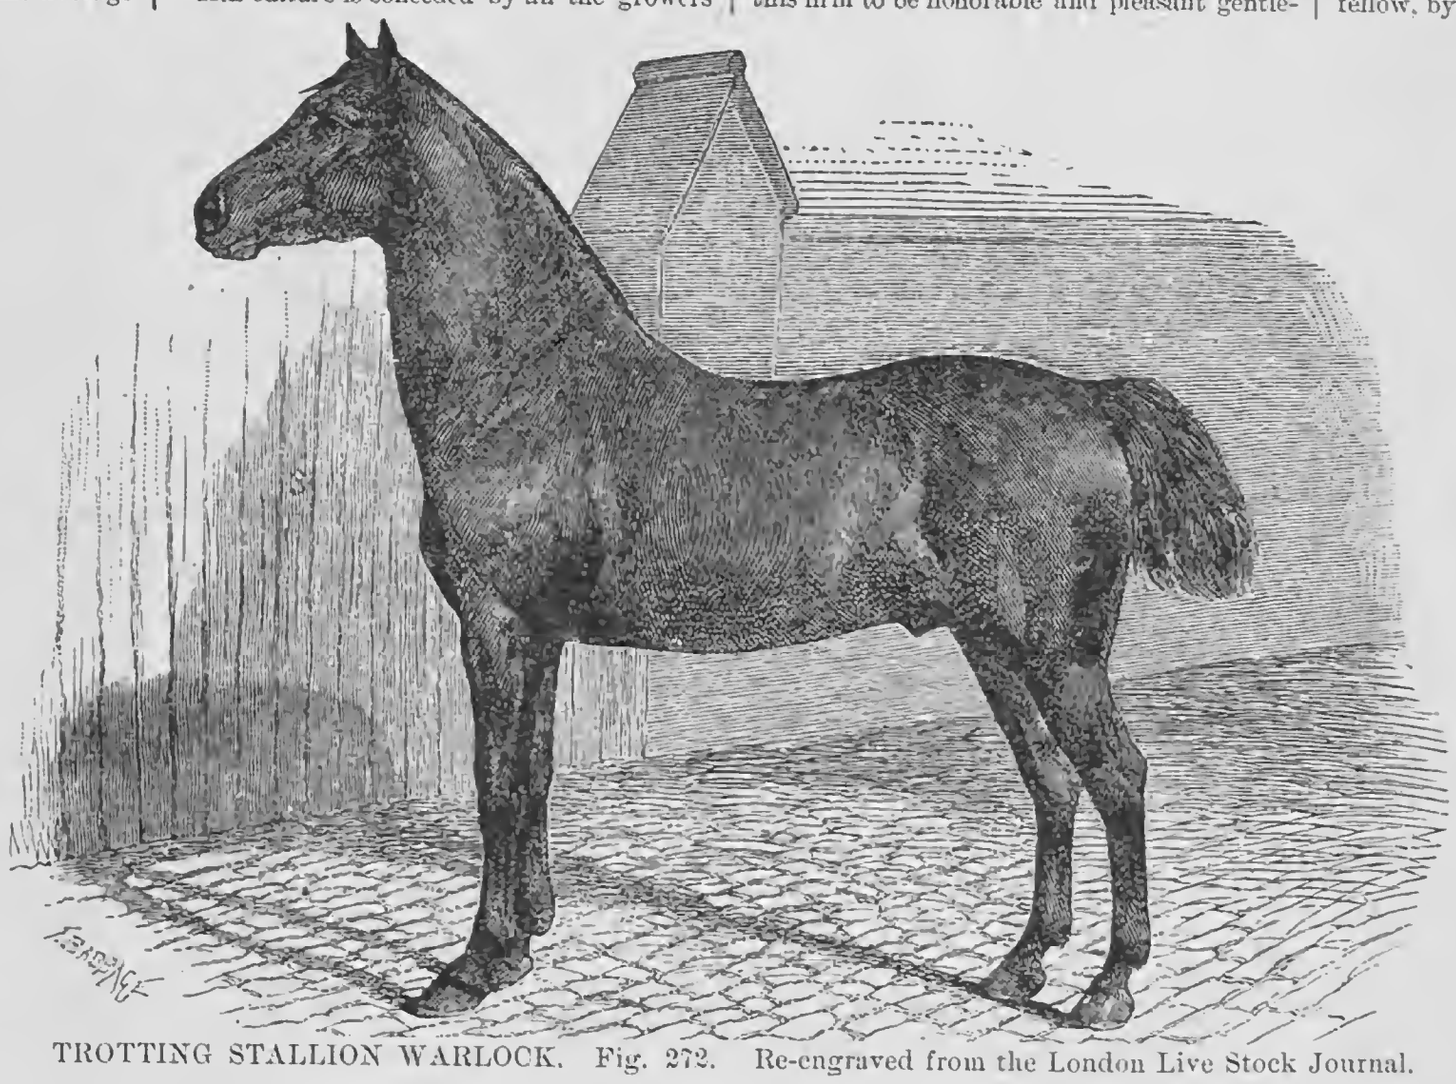
TROTTERS.

TROTTING STALLION WARLOCK.

AMERICA is, *par excellence*, the home of the trotter. The trotters of this country can easily fling their dust in the faces of any other roadsters in the world. Even here, however, the trotter is a comparatively modern development. Fifty years ago a horse that could trot a mile in three minutes was a wonder; nowadays so much of the attention of breeders and the public is given to a few phenomenal flyers, like Goldsmith Maid, St. Julien, and Maud S., that the vast number of horses that can trot their mile in 2.50 or even 2.30 are lost sight of, although less than a quarter of a century ago an animal with this gait would have attracted no small degree of wonder and admiration. This increase in speed is due mainly to breeding, but improvements in the system of breaking, training, and driving, as well as in courses, vehicles, and harness, have all contributed to it. There has also been a great increase in the number of horses trained as trotters, and the statistics of the various trotting courses show that the average speed of trotters has improved, and it is quite natural that as the average excellence of the multitude increases the excellence of the best among them should advance at least proportionately; for, as a rule, it is easier to be the best among a few than the best among many.

By constantly selecting for breeding purposes animals that have excelled the average in speed, and rejecting all their progeny which failed to inherit this quality, and confining their attention mainly to the few families, such as the Hambletonians, Clays, Bashaws, and Mambrinos, in which there has been noticed a marked inherited tendency to speed, American breeders have gone far towards producing a distinct breed of trotters in which superiority in the trotting gait is inherent and transmissible.

In England the race-horse and hunter have always received a great deal more, and the trotter a great deal less general attention than they have met with in this country. The English have always had the stock from which trotters can be developed; but sufficient care has never been given to the matter to produce any thing remarkable in the way of speed, so that a three-minute trotter is no commoner in England to-day than 2.35 minute flyer is on this side of the water. Indeed some of the English rules for trotting matches have doubtless been a check on making the best time of which a horse is capable. For instance, in case of a break in a race to wagon or sulky, the driver was compelled to pull up and back the wheels, and if the race was under saddle the rider must stop and turn the horse round whenever he broke. It was, therefore, quite natural that the driver or rider would be afraid to push his animal to the top of his speed.



TROTTING STALLION WARLOCK. Fig. 272. Re-engraved from the London Live Stock Journal.

While several of our very best race-horses, like Umpire, Iriquois, and Foxall, have been taken to England to compete for the "Blue Ribbon of the Turf" at the Derby, and for the honors and emoluments of other famous meetings, none of our strictly first-class trotters has ever crossed the Atlantic.

In comparison with the trotters of their respective days, Rattler, taken over 42 years ago, was probably as good as any ever imported. So brilliantly did he defeat all transatlantic opponents, under the guidance of an American driver, that those who handled him challenged the whole world with impunity; but on this side of the Atlantic no one doubted that Dutchman could have easily beaten him, and he would have crossed over to do so, under the management of Hiram Woodruff, were it not for a trifling disagreement as to the price to be paid for him.

Since then a considerable number of excellent trotters have been exported, not only to the United Kingdom, but also to the Continent, and among the best of the late shipments is the trotting stallion Warlock, Fig. 272, which was bred by the famous Kentucky breeder, A. J. Alexander. His pedigree is excellent, from a trotting point of view, having been got by Belmont, out of Waterwitch, by Pilot Jr. He inherits, therefore, some of the very best trotting blood, Belmont being by a grandson of Hambletonian, while Pilot Jr. was the grandsire of Maud S., the fastest trotter in the world. In England he is attracting a good deal of attention, and much is expected from him, but in the stud rather than on the track.

Indust'l Societies.

OHIO STATE HORTICULTURAL SOCIETY.

(RURAL SPECIAL REPORT.)

THE first summer meeting of this society was held at Barnesville, O., June 9 and 10. The first day was spent in a tour of inspection among the berry patches, for which the region is so famous. There are at present about 66 growers who cultivate an aggregate of 150 or more acres of strawberries and rather more of raspberries. About 1,000 bushels are now shipped daily. The crop for the season is estimated at about 10,000 bushels each of raspberries and strawberries. The quantity of fruit grown is exceeded by many other localities outside of the State, but probably nowhere are there grown such fine strawberries as at Barnesville. The reason for this is partly because of the method of culture and partly because none but the finest varieties are planted. Sharpless, Jucunda, Cumberland, Manchester, Wilson, Crescent and some other sorts are grown, but Sharpless is the general favorite because of the large size of its fruit, the vigor and health of the plant, and its readiness to respond to good treatment.

Hill culture is conceded by all the growers to be the most profitable, and is practiced by many. Some adopt the matted-row system because it involves less labor, while others follow the compromise plan, which means to allow only a part of the runners to take root. Fertilizers are used as abundantly as the means of the grower will permit—160 loads of barn-yard manure per acre have been used, and it is thought profitably. Some growers have replanted the same ground several times. One is now picking the second crop from the third planting, or the eighth crop from the same ground. The berries actually lie in heaps by the side of the plants, so prolific are they. A moderate dressing of manure was given at planting, but no more. The estimated cost of an acre up to the time of picking varies considerably, but the average is not far from $100. The yield is about 150 bushels per acre, and if sold at $2.50 to $3.50 per bushel—the prices realized thus far—the profits are not large, but the growers express themselves as satisfied if they can do as well for the whole season.

The evening of the first day was spent in reading essays, discussions and admiring the fine exhibit of strawberries and cherries. Larger collections of varieties have been seen elsewhere, but those competent to judge declare that no finer exhibit of strawberries ever was made. Wednesday forenoon was to have been spent in further inspection of berry fields, but rain prevented. Pres. Ohmer and others were unanimous in the opinion that our first summer meeting had been a grand success, and that the object lessons of the day and a half had been worth vastly more than any number of essays and discussions.

W. J. GREEN, *Sec. pro tem.*

Various.

CATALOGUES, ETC., RECEIVED.

AGRICULTURAL COLLEGES.—A report by Prof. Wm. Saunders, published as an appendix to the report of the Minister of Agriculture of Canada.—In this pamphlet the author has apparently made a condensation of the catalogues of all the agricultural colleges in America. It is a valuable pamphlet, and teaches some very forcible lessons. It is surprising to learn that there are 40 institutions in the country dignified by the name of "agricultural schools." We never hear of more than half a dozen. Every State appears to attempt to support an institution for the purpose of imparting agricultural education, some of them having two or three. In every instance where the agricultural college is combined with a literary school, the number of students taking the course in agriculture is so small as to be ridiculous. Four institutions apparently contain 80 per cent. of the college students who are learning anything about agriculture. In these colleges, the labor system is rigidly enforced, and there is no "literary" distinction possible.

BROCKNER & EVANS.—A set of pamphlets from the above firm, located at 28 Vesey St., New York.—These pamphlets are entitled "Can Dogs Be Hatched?" "How to House, Train, and Care for the Dog," and "How to Fence the Poultry Yard, Kennel, Lawn, and Garden." Customers will find the members of this firm to be honorable and pleasant gentlemen. The "Standard" wire fencing has given excellent satisfaction. The manner in which it is prepared and put up is well described in the pamphlet. The suggestions as to the breeding and training of dogs will be appreciated by all dog owners. The shipping cases, kennels, and other dog furnishings will be sure to please. The "Invincible Hatcher" has received the very highest testimonials from press and public.

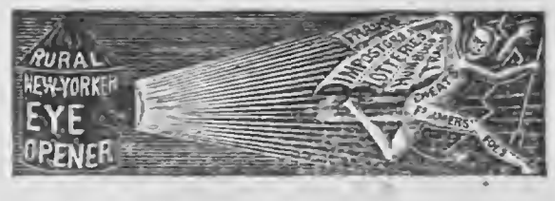
BEAUTIFY YOUR LAWN.—Circular from John M. Pearson, Hudson, N. Y.—This dressing is described as clean, pure, inodorous and effective. All of these qualities are desirable in a lawn dressing. Where stable manure is used, the lawn cannot be used for games or walks, and the odor is very offensive to those who are unused to it. Then, again, there is danger of seeding the lawn to weeds. This dressing enables the owner to fertilize his lawn effectively and easily, while avoiding all the unpleasant features that come with an application of a more bulky manure.

STANDARD TROTTING STALLIONS, "Chester Chief" and "Harry Plummer."—These fine horses will make the season at Chestnut Stock Farm, near Chester Depot. Address Joseph Gavin, Chester, Orange Co., N. Y.—Chester Chief is a bay 15¼ hands high. He is called the best proportioned horse Hambletonian ever sired. At five years he trotted a mile in 2.28, and repeatedly trotted a quarter in 35 seconds. Harry Plummer is by Harry Clay; dam, Netty Plummer. He is a fine horse and can easily show a 2.35 gait. These horses need to be seen on the road, in harness, to be appreciated. Full particulars mailed on application.

DEATH TO INSECTS.—Circular descriptive of the Woodason Insect Exterminators.—As we have repeatedly stated, we find the Woodason bellows very efficient for spraying shrubs and plants with poisonous mixtures. We can indorse what is said in the circular. From Thomas Woodason, 74 Canalport Avenue, Chicago, Ill.

SCENTED ROSE BUSH LEAVES.

OF late our florists across the water, have been vigorously agitating the subject of scented leaves from rose bushes. Over here most amateur growers are very thankful if they can keep the foliage clean, fresh and free from insects. But if any of the delicious aroma from the lovely Sweet Briar can be imparted to our garden foliage, let us have it of course. We can at least plant more of the Sweet Briar in our gardens, and why don't we? It is one of Nature's choicest bits for the eye and nostril of man. "Just two lovely for anything," in feminine parlance. H. H.



JACOB HICKMAN, an old farmer, near Galesburg, Ill., was swindled out of $2,500 last Thursday by three sharpers. Two of them drove up and said they wanted to buy a farm for a widow. They got him to ride with them to show them one of his farms, and, of course, on the way they met the confederate. This fellow, by the aid of the others, induced old Hickman to take a chance in a lottery scheme, and he drew a $25,000 prize. They demanded 10 per cent. ($2,500) cash down as one of the conditions for getting the prize. He drew the money from the bank at Galesburg, gave it to them, and started for home to make preliminary arrangements. On the way one of the sharpers became violently sick, and the others induced the old simpleton to go on alone, saying they would come right on after him. They haven't done so yet. Old man frantic. Officers scouring the country—probably in vain.

TO SEVERAL INQUIRERS.—J. W. Bain and W. H. Baird are poultry sharps who advertise from several places in Ohio, but chiefly of late from Zanesville. Their tricks and dishonesty have been repeatedly exposed in this department, and by a large number of other reputable papers in different parts of the country. Bain has for years been operating under or through different aliases, and is a shrewd, dangerous rogue. The "crowd" have lately started the "American Poultry Adviser," and we certainly strongly advise our readers to have nothing to do with it or them.

Literary.

BOOKS RECEIVED.

FOREORDAINED. Published by the Fowler & Wells Co., New York.

A sensible and practical book which might very profitably be read by all thoughtful persons. It is called "A Story of Heredity," but in reality it is not a story at all, but a scientific essay on the laws of heredity. The design of the book is to show that children are positively sure to inherit certain diseases, bad temper, selfishness, or any propensity to self-indulgence. Perhaps a good idea of the general thought of the book may be gleaned from a quotation which is introduced to point its argument: "Parents should be aware that no precept which they can inculcate, or example which they can set, will turn bad tempers into good ones, neither can hygiene or exercise, or all the fresh air in the world, create good constitutions." It is claimed that every child has within it certain latent forces. These forces can be directed by culture, but they cannot be changed. On this principle criminals and drunkards may not justly be held wholly responsible for their acts. We think the book purposely errs on the right side. That is to say, it places its facts in the strongest possible light, without qualification, in order to startle readers into a thoughtful consideration of its contents. One might get the idea from these pages that he who carried in his veins any hereditary taint must consider himself cursed. This we do not care to believe. We prefer to think that any person can, by proper regard for the laws of health, strengthen the body, and through it the mind and the will, and resist temptation. The

career of a strong, healthy man ought to rest with himself.

TOMMY'S FIRST SPEAKER. Published by W. H. Harrison, Jr., Chicago, Ill.

Every mother likes to have her little boy learn to "speak a piece." There is nothing more "cunning" than the sight of some bright little fellow standing up before the company, making wise gestures and talking like a man. Many a mother's heart has magnified the little speaker into some mighty orator that the years have in training. This vision may be seldom realized, yet the idea of teaching children to memorize and recite simple poems or portions of essays is a good one. The memory is cultivated, a confidence in ourselves awakened, and an ease and grace of manner are developed. It is hardest to find a "piece" that will be suitable for the very little people who cannot remember a long poem and who cannot be expected to understand a thoughtful production. The little poems found in the book under consideration are admirably suited to supply this want. They are short, simple and bright. There are no long words, but the diction is such that any little boy can understand all the poems. The book is said to be edited by Tommy himself. "Tommy" is evidently a pretty old boy, but like all who grow old gracefully, he remembers his youth.

HANDBOOK OF ENGLISH HISTORY. By Francis H. Underwood, A.M. Published by Lee & Shepard, Boston. Price $1.20.

This book is based on the lectures of the late M. J. Guest. The list of English histories is already large. The number of people in active life who have time to read several histories for the sake of comparing the opinions of the various historians is limited. Perhaps for this reason this volume may be useful. It has the merit of being condensed and carefully written. The original production, being written as a series of lectures, was comparatively wordy. No attempt is made to introduce descriptive passages. The story of the battle of Waterloo is all told in two pages, and curt, short sentences are the rule. For this reason the present volume will be useful as a textbook for the student who desires to use it as a skeleton, and to fill in with readings from other authors. The comments on political events appear to be as impartial and truthful as any we have seen.

LYRICS OF LIFE, by John Grosvenor Wilson. Published by the Caxton Book Concern. Limited.

All men, at some period of their lives, write poetry. Most of us have the disease before we are 30, and pass the rest of life in trying to hide all evidence of our contributions to poetic literature. We can see no reason why the present volume should have been published unless friends of the author wished to show their friendly appreciation by buying a book which personal association alone can make readable. We surely could not advise our friends to buy it. The world is crowded with rhyme, but the list of real poets does not appear to grow very rapidly. We prefer to read Whittier or Longfellow or Tennyson over and over again, than to spend time upon this fledgling poetry.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

SPRING.

The song of a woman who does her own work.

SPRING!
To be sure—so it is—and I'm going to sing,
Not the tunes that the regular poets rehearse
In ridiculous verse.
I've nothing of winds aromatic to say,
Nor pansies, nor tulips, nor hyacinths gay.
I live in the city,
And discover no pretty
Green leaflet or bud
Sticking out of the mud;
Nor do I hear warble of black bird or blue;
Yet I know it is Spring just as well as you do.
Aye, I know it *too* well, for it's *all* spring to me;
From long before breakfast till long after tea.
I spring with the mats and the rugs out-of door;
spring to the carpets—drag them from the floor;
I spring up step-ladders and wash down the walls;
I spring to the windows, I spring to the halls;
I spring to each corner, each closet, each nook;
I spring at each dust-laden picture and book;
I spring to the garret, where cobwebs abound;
I spring (if I may be allowed the expression) to the cellar, half-way underground;
I spring—but, good gracious! to tell everything
I spring at would take me the whole of the Spring.
And when Spring is over I feel, I declare,
As though *my* springs were broken beyond all repair.
Spring!
To be sure—so it is—but let nobody bring
Any poems to me about beautiful flowers,
Or life-giving showers,
Or vine-covered bowers,
Or sunshiny hours,
For realy such things seem extremely unmeaning
To one on whom springs a lot of spring cleaning.

Harper's Bazar.

OF INTEREST TO WOMEN.

FRENCH batiste comes in very pretty combinations, with cream or ecru as a prevailing ground tint. An over-dress of the plain color is usually made with skirt of the combination, cream and navy blue or cream and seal-brown is the favorite combination. Next to the batiste, which is really like a very fine smooth linen, crinkled seersucker may rank in prettiness and durability. It is very pretty in cream color, and above suspicion as a washing fabric. It has the added charm of being very inexpensive.

According to American silk manufacturers, staple articles, such as dress goods and handkerchiefs scarcely pay for the making, owing to extreme competition. The most profitable branch of the business now is making tailors tags for sewing on overcoats and the like which have the tailor's name woven in the silk.

Crazy work has had its day, which is a matter of congratulation to many. Its successor is silk strips woven together like rag carpet, which makes a very heavy and rich fabric, suitable for portieres and upholstery. It is especially effective when tinsel is woven in with the silk.

Just at this season, when dwellers in the country or suburbs are surrounded by a wealth of blossoms, it is only just to remember the sick and suffering among the city poor. The New York Flower Mission gladdens the eyes of thousands by its work, both in tenements and in city institutions. The flowers distributed come from anywhere within a radius of 50 miles; they are generously transported free by the railways, and on their arrival at the Mission are made into bunches before distributing. All flowers are acceptable, but fragrant ones are always chosen for the blind.

Last week we spoke of the "Plumage Societies" organized in England, intended for the protection of birds. In this country it is impossible to mention the number of birds slaughtered for millinery use, but we hear of a single collector bringing to a taxidermist the skins of 70,000 birds, killed in one district during four months. To combat this wholesale evil, it is proposed to form an association for the protection of wild birds and their eggs, to be known as the Audubon Society. Its membership is free to any one willing to aid in this work. This work is to prevent, if possible, the killing of any wild bird not used as food; the destruction of nest or eggs of any wild bird, and the wearing of birds as ornaments or dress trimming. All desirous of joining this society should send their names to the "Forest and Stream," 40 Park Row, New York.

Says the Detroit Free Press: "A wife's life is made up of little pleasures, of little tastes, of little cares, and little antics, but which, when added up together, make a grand sum total of human happiness. She is not expected to do any grand work, her province lies in a contrary direction—in gentleness, in cheerfulness, in contentment, in housewifery, in care and management of her children, in sweetening her husband's cup of life when it is, as it often is a bitter one, in abnegation of self—these are emphatically a "woman's rights;" her heritage, her jewels, which help to make her crown of glory.

"The trivial round, the common task,
Would furnish all we ought to ask;
Room to deny ourselves; a road
To bring us daily nearer God."

There is in "Crabbe's Poems" a conversation supposed to take place between husband and wife, which is very beautiful, containing advice to both. The husband addresses the wife thus:

"Each on the other must in all depend—
The kind adviser, the unfailing friend;
Through the rough world we must each other aid,
Leading and led, obeying and obey'd:
Favored and favoring, eager to believe
What should be truth; unwilling to perceive
What might offend, determined to remove
What has offended; wisely to improve
What pleases yet, and guard returning love!"

NEHEMIAH'S PLAN.

WHEN pious Nehemiah saw the melancholy estate of his fellow Jews after the captivity, unable to protect themselves in their ruined city, he did not sit down and lament their fallen condition; he just built up the city wall nearest his own dwelling. Unmoved by the ridicule showered on him, he kept on with his work, and gradually pursuaded his friends to do likewise until the wall was rebuilt, the temple re-consecrated, and the people returned to their father's worship. Nehemiah's plan seems a fine rule for every-day use, if we can understand its true significance. It teaches us to do the duty that lies nearest us—often the hardest of all things. How much easier it seems to do some great work than to accomodate ourselves and our frailties to the friction of home life! Says Thomas à Kempis: "It is no great thing to live peacefully with the good and gentle, for this is naturally pleasing to all, and every one likes to be at peace, and prefers those who agree with them. But to be able to live in peace with those who are hard and obstinate, or who are undisciplined and contrary, is a great grace, and a highly praiseworthy and manly line of conduct."

"If I could only do something rather than these narrow tasks and homely duties," sighs many a dreamy girl. Ah, dreamer, if you would only follow Nehemiah's plan!

"A servant with this clause
Makes drudgery divine;
Who sweeps a room as for Thy laws,
Makes that and th' action fine."

It is not what you do, but how you do it. Little aids and kindnesses, little acts of self denial—how much they may mean if we could only see the pattern our life is weaving!

Said a bright girl to the writer:

"The greatest cross I have in my life is the necessity of staying home and trying to be good, when I've always wanted to be an hospital nurse, giving up my whole life to charity."

Dear girl! she is the sunshine of her father's house, and surely her gentle ministry is as much the quintessence of charity as if she devoted it to the highways and hedges. To do the work that lies nearest us, that is the very pith and marrow of our usefulness. Think of Mrs. Jellyby, with the gravy boat full of envelopes and the tea-kettle lying on a guest's dressing table, while the serene hostess dictated philanthropic letters about Boorioboola gha! Charity begins at home, though too many are willing to let it end there.

If we do the work set before us in our own immediate circle new interests and new opportunities will surely present themselves. One single work of love—who can judge its effect? It is like dropping a stone into a silent pool, with its ever-widening circles and ripples. Nor is it solely the effects on others; every effort for a higher plane of thought and character strengthens and perfects us; every labor of love widens our sympathies. Plain living and high thinking—let those be our watchwords until we attain our ideal life.

MARY WAGER-FISHER.

THE portrait of Mary Wager-Fisher in a recent issue of the RURAL is a most welcome surprise that every reader will appreciate. How much her intelligent face resembles her letters; clear, frank, perspicuous and determined. I like it. No such face ever goes through the world without "amounting to something," because there is force of character and individuality back of it that are bound to leave an impress which lasts through coming centuries. In the modest sketch of her life, she leaves the reader slightly in doubt in regard to the fiery temper of her youth; how she managed to control it in later years, or whether it ever became fully under subjection. I write this under the impression that Mrs. Fisher is still off on the Pacific Coast, of course.

In this brief sketch, which all school girls may read with profit, it will be noted that this lady was born and reared upon a farm, where she learned to make butter and bread, to sew and to knit, all of which accomplishments she says served her well afterwards. She "hated to knit," but has found that the only way to get anything done was "to do it." If she can fully impress this simple lesson upon the girls and maidens of America, hers will be a grand life work indeed. Far too many of the girls of the present day, in the country as well as the towns, are idly drifting into womanhood wholly without aim or object. They indulge in the filmy fabric of a hope that has neither warp nor woof, while the mothers are making the bread and butter in the kitchens and carrying out the realities of existence. A wife who can't make a good loaf of bread with her own hands isn't worth having. There now; I've said it, and its true, if I do get in a RURAL bee's nest for it. H. H.

CANDY AND CHILDREN'S TEETH.

I WONDER how many mothers of young children read this department? How many mothers of grown children will read it and will kindly give their experience of the effect of candy on children's teeth.

All our children have had teeth and were literally crammed with sweets. My own experience with children began with a step-son four years old, who would eat little else than pound for pound preserves, sugar, cream and candy, with cake and cookies, instead of bread and vegetables. He looked fat, but was light as a feather, and very small. His teeth decayed so that all his double ones had to be filled before he was 15, and he suffered terribly from toothache.

I made up my mind that my children should never have candy, and the holidays brought them fruit, books, pictures, nails and hammers, miniature tools, etc., but no sweets. None of them ever had toothache while under my care. None have ever yet had even on their "Baby teeth" the least speck of decay or discoloration, the eldest now living being 22 years old. When my eldest, as a lad of 16 first went from home, it occurred to him, so he told me afterward, that he could eat candy. He bought a pound, ate it in the course of 10 days, and had the toothache for the first time in his life.

"Oh, mother," he said "it got so bad before I could have the tooth drawn, that neither chloroform nor laudanum helped me to sleep. That six weeks misery with an ulcerated tooth made me sure it was not 'a mere whim' that caused you to deny us candy."

Dear lad! I have had torture enough from ulcerated teeth myself to know how he must have suffered. AUNT E.

GOLDEN GRAINS.

THERE are a good many people who carry their religion as though it were a basket of eggs—all the time afraid that it will break..

GREAT thoughts are among our most precious and abiding treasures. They enlighten our darkness, they people our solitude, and while other things fall from us, like the leaves which are loosened from the greenwood tree, these remain, like the atoms which go to build up its girth, being woven into the very substance and tissue of the soul.....

AN ability and an opportunity to do good, ought to be considered as a call to do it.....

WE should never go in the way of temptation for the purpose of trying the strength of our virtue..... .....

BISHOP WHATELY says: "If our religion is not true, we are bound to change it; if it is true, we are bound to propagate it."....

AT the Fiftieth Anniversary of the Union Theological Seminary, Dr. Hitchcock said: "Character always decides a man's condition. A man of character will rise above the circumstances in which he is placed. The greater part of poverty is culpable. Annihilate whisky and you almost annihilate poverty. The industrial classes should be taught how to be economical. The American laborer spends three or four times as much as the one in England or Germany. The laborer should share in the profits of the production, but not in the direction of the capital employed."....

ARBITRATION cannot be successful to any great extent in settling differences between employers and their employés, because it involves the surrender of the liberty of both parties.....

BESIDE the welfare of the individual, the common weal must be looked after. It is possible that in the future restricted immigration may be necessary for this country. Labor is weaker than capital, hence legislative protection is necessary. Eight hours are enough for a day's work, but the question of how much shall be paid for a day of eight hours remains to be decided.....

"No man is more severely punished than he who is subject to the whip of his own remorse," is as true to-day as it was in the days of Seneca..... .....

SMILES emphasizes the necessity of self-restraint; he says: "For want of self-restraint, many men are engaged all their lives in fighting with difficulties of their own making, and rendering success impossible by their own cross-grained ungentleness; whilst others, it may be much less gifted, make their way and achieve success by simple patience, equanimity and self-control."....

A WELL-KNOWN lecturer says: "The most beautiful thing God ever made is a five-year-old girl, fifty springs in each heel, a hundred day dawns in each cheek, and a whole flock of morning larks and nightingales in her throat. Religion makes no distortions, and the child, for all its piety, should be none the less a child."....

"WE see," says Mr. Beecher, "the principle of heredity set forth in the passage, 'Visiting the iniquity of the fathers upon the children.' That is, making the children bear the result of the parents' conduct. It is a principle well established, that the faults of the parents do visit themselves upon the children, both mentally and physically. A man who leads a virtuous life hands down virtue to his children, and the man who is a Christian through his life, hands down, as it were, the Gospel to his children, while the parent whose life is a violation of law, sends down an inheritance of damnation to his descendants. Retribution is a part of the economy of God. It is not an exception to divine goodness, but a part of it, and it is especially designed to hold men in the right way and to warn them when they step out of it that they are going in a wrong direction".....

FEW great preachers have so many words of comfort as Dr. Talmage. "'Cast thy burden upon the Lord.' Does your head ache? His wore the thorn. Do your feet hurt? His were crushed of the spikes. Is your side painful? His were struck by the spear. Do you feel like giving way under the burden? His weak-

ness gave way under a cross. While you are in every possible way to try to restore your physical vigor, you are to remember that more soothing than any anodyne and more vitalizing than any stimulant, and more strengthening than any tonic is the prescription of the text: 'Cast thy burden upon the Lord, and He shall sustain thee.'".....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

PITHS.

CHEESE that is easily crumbled is digestible, and may be eaten without fear. It is the India-rubber article that gives one a fit of the blues.

A feather duster is a delusion and a snare—it is simply a "flirter."

A piece of lemon is excellent for cleaning the hands.

It is a mistake to put spoons in the holder handles down.

A very thin coat of what is known as French picture varnish will restore chromos and oil paintings to their original brightness.

Lazy people are abominations—dead weights to be carried upon some one's overburdened shoulders.

Buttermilk and lemon juice are harmless cosmetics for removing sunburn and freckles.

Don't reprove children before company—it hardens them and lessens their self-respect.

HOUSEKEEPING IN CALIFORNIA.—IX.

MARY WAGER-FISHER.

As the Winter sped on some things developed differently from what had been predicted. No ants appeared in the closets, for which I was very glad, for I have a profound respect for the extraordinary intelligence of these small creatures, and never kill one purposely. But mice appeared, and gave us considerable trouble. We had no trouble to catch them, as the trap we make use of never fails—a bowl turned up with one edge resting on a loop formed of a whalebone, or flat strip of steel, with a bit of cheese held in the two tied-together ends: but the trouble lay in knowing what to do with the mice after they were caught, for there was not one of us who could kill the pretty, furred animals, with their bright eyes, and the upshot was that they nearly all escaped. But they seemed to learn wisdom from their experiences, and finally remained away.

The water, too, instead of becoming worse, became much better after the lake was filled from the rains, and we gradually became somewhat reconciled to it, as the only fault it retained was muddiness after a heavy rain—and when it rains in California it rains a regular down-pour. During the first half of January, it was what the people called "very cold." The mercury would fall in the night to 26° or 28°, and the ground would be frosted. The Calla Lilies were scorched by the frost, and the rose geraniums—but they all quickly recovered. For a week or so, I did not cut the geraniums, for my flower vases, and I found a graceful substitute for green leaves in the bed of carrots in the back yard, the tops of which were beautifully green all the time, and we didn't care for the roots. A friend often brought me, in January, flowers once or twice a week—great bunches of violets, roses, carnations, etc., but from February 1st the violets, primroses, narcissus, etc., were abloom in our own garden. I gave myself a whole holiday on February 3—a glorious sunny day—and taking the laddie with me, we went off to the hills back of Berkeley, and one of the first shrubs I discovered in full bloom was the wild currant—Ribes sanguineum—and further on I was fairly carried out of myself at great clumps of lupin in bloom, and I came home with my arms full of flowers, topped off with the graceful acacia that made all the country round aglow with its yellow magnificence! We took a simple lunch with us—dried California figs—three pounds for 25 cents and dry bread—and I spread a shawl over a clump of sage brush which made for us a nice seat. But it was uncomfortably hot in the sun to sit for long.

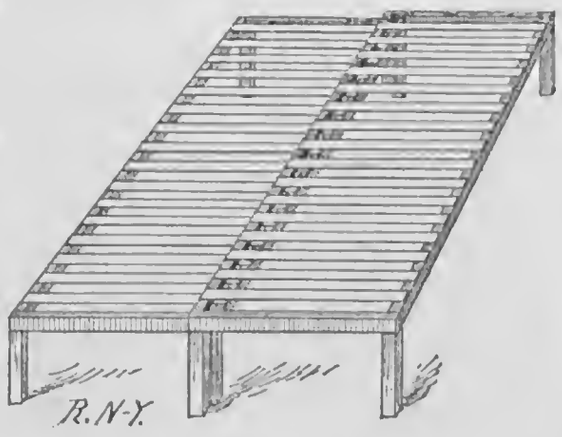
Berkeley, where the State University is located is one of the most enchanting sites in the world, its groves of Live Oak and the adorable panorama spread out seaward. While the experimental grounds—gardens in which grow cinchona camphor tree, Chinese bamboo, and the olive, where it is a perpetual Summer the year around, but foggy throughout June and July and bad "for the lungs"—could I ever console myself with the blizzards and cold and winds of a Pennsylvania Winter, and the scorching heat of its Summer?—were questions I often asked myself. But in California people complain as much of the weather as we do elsewhere, and say that after a few years of residence here, they feel the cold as much as ever they did East. I sat at my writing or sewing all Winter, on sunny days, in an upstairs room, with a large window fronting the South, without ever a fire, and needed none. A friend told me that she always, for 10 years, had spent Christmas with friends living in the foot-hills, about 30 miles from San José; and that for Christmas dinner they never failed to have asparagus, lettuce and green peas, fresh, and from gardens in the neighborhood, and at that time raspberries were quite plentiful in the market. On one New Year's Day, they found 64 varieties of garden and field flowers in bloom—but that was an "exceptional" New Year's—and as usual all the bad weather was "exceptional." We got used to the word, however. It all suited me—and I had decidedly "exceptional" health. But the laddie had only contempt for a Winter without snow, and feared that he would become "unhardy misfortunately" and not like the Winters at home. But all Winter his radiant face glowed with perfect health, a child who has never known an ache or pain—for which Heaven be thanked. Anaximander found the climate not altogether "delightful"; it tended to the development of bronchitis—and it was a common remark that the coast climate gave everybody, soon or late, catarrh or neuralgia. But we could, both of us, work mentally as never before, and the ability to do this was another marked characteristic of the "climate."

Our housekeeping went on much as usual in "California fashion," except that after a little we found that it consumed too much time to prepare three meals per diem, and we resolved to have an early five or half-past-five-o'clock dinner and take a "standing lunch." Usually the luncheon consisted of a pudding baked during the breakfast getting. Some friends of mine who are artists and very busy women, said that for luncheon—when Mr. A., the husband and father, was not at home—they had hot milk—not scalded—and bread and fruit, and as everything was done so in a rush with them, they found such a repast just the thing for easy digestion; the milk cold did not agree with their stomachs. But when Mr. A. was at home more had to be prepared, as usual! The mercy only knows why a man, who works no harder than women, should require his "regular" meat meal three times a day, with all the circumstance of cloth and china? When in camp, and where no women are around, he can lean against a tree and gnaw a bone and munch bread and cheese, and feel never aggrieved—even cook a meal and wash out his stockings and shirt. But if his wife is around, he lapses at once into helplessness. It comes, I suppose, from his having been "spoiled" by being "coddled!" But our informal lunch worked satisfactorily, and after the early dinner until half-past seven 'twas the laddie's hour. We saw the man on horseback dash through the street lighting the street lamps, and then—

(*Continued in next paper.*)

NEBRASKA BEDSTEAD.

I send you a sketch of a bedstead that we made. I put two narrow ticks on it close together, then double a heavy quilt and throw it across the middle. The bedstead is very



light, the slats are of laths, and I can shove it together, put one tick on top of the other, and cover it with a lounge spread in less time than it takes me to tell it. It is a great convenience where lumber is scarce and the houses are as small as they are here in Nebraska. It should be very low to admit of one tick being placed on top of the other when not in use.

MRS. E. ANNIE WRIGHT.

CHERRY PIE AND OTHER SEASONABLE DESSERTS.

ALWAYS let a fruit pie be a "fat" one. Use the deepest pie dish you can get, line it with paste and fill with successive layers of cherries and sugar, and cover and bake in a moderate oven. A little flour (about a tablespoonful in all) dredged over the different layers will cause the juice to thicken and it will not be so apt to run out. A mixture of the sour pie cherry and the Black Tartarian makes the best pie.

Strawberry tarts are made by mashing a pint of berries thoroughly with four tablespoonfuls of sugar, add two well-beaten eggs, line patty-pans two-thirds full and bake.

Strawberry fool is a dessert greatly liked by many. Put a quart of berries over the fire in a porcelain saucepan with a quarter of a pound of white sugar, cover closely, and stew gently for ten minutes. Shake the pan occasionally to keep them from burning, remove from the fire, rub through a hair sieve with the back of a wooden spoon. Set away to cool, and then stir a gill of rich cream. Place on the ice until thoroughly cold, and serve.

Strawberry Blanc-mange is also very nice. Put a quart of berries on a dish and sprinkle over them a quarter of a pound of sugar, letting them stand for several hours. Meantime have made a blanc-mange of gelatine, sweetened to taste, and stir into it the juice that has oozed from the berries. When all is mixed thoroughly, put in a mold that has been wet with cold water, and set in a cold place until needed for use. Place the strawberries around the base.

For strawberry ice-cream mash a pound of fully ripe berries with half a pound of pulverized sugar. Rub through a sieve. Mix with a pint of cream and freeze. For strawberry water-ice, rub one pound of berries and half a pound of currants through a sieve with three-quarters of a pound of sugar, and freeze.

It is almost a pity to use oranges when other fruits are so cheap, but this recipe will do for the season when oranges are the most plentiful and the cheapest fruit: peel and slice a dozen oranges and arrange in a glass dish with grated cocoanut and powdered sugar in successive layers. A small grated cocoanut and half a cup of powdered sugar will be sufficient for the above number of oranges.

A salad or Macedoine of fruits can be made most exquisitely where many different kinds of fruits can be obtained at once. Arrange cherries (stoned), berries, currants, raspberries, pineapples and bananas in such proportions as your taste may direct, with sugar between each layer, add the juice of three oranges to a large dishful, and serve very cold. You may pass around cream with it for those who like it.

Strawberries should never be washed unless they are very sandy, and then you had better not buy them, as washing destroys their flavor. You may say that you don't know who picked them, but Marion Harland says you might as well say you don't know who washed them and in what, as she once saw a housekeeper wash berries in a wash-hand basin! There is no doubt that washing lessens the flavor of the fruit. There are some people who suffer from dyspepsia after eating berries. If they would eat unwashed berries without sugar, the trouble would be lessened. PALMETTO.

FOR THE SICK ROOM.

SACK POSSET.

POUND or roll one Boston cracker or a soda biscuit, and set it over the fire in a pint of cold milk; simmer 15 minutes. Beat one egg with a wine-glass of wine, a spoonful of sugar, a little salt and a dash of nutmeg. Turn this into the milk, stirring constantly, boil up once and take from the fire.

WINE WHEY.

Bring to a boil one cup of new milk, and stir in half a glass of sherry wine. Boil a moment and strain. Sweeten if liked. This is very nutritious. NURSE.

TO RENOVATE MENS' STRAW HATS.

As the season for straw hats is at hand, often old ones of last year's wear will be found that might be made to render considerable service yet, if cleaned and a new band applied. Wash these old hats with rain-water and Palm-oil soap, which will remove the dirt and grease, and make them look bright and clean. DASH.

MRS. HOMESPUN'S RECIPES.

YEAST.

EIGHT fair-sized raw potatoes grated, a tablespoonful of salt, the same of sugar, a teaspoonful of ginger and three tablespoonfuls of flour. Stir this into the grated potato. Have a handful of hops boiled, and pour the water on this, then turn on boiling water enough to make this a thick paste, and with a good fire cook all five minutes. Cool and put in enough yeast to raise it. Stir down repeatedly as it rises, and then cover well and set away in a cool place.

POT-PIE DUMPLINGS.

A quart of flour with two teaspoonfuls of baking powder sifted in it. Rub in a piece of butter the size of an egg, add a pinch of salt and wet up with sweet milk. Stir thick with a spoon. Drop this in chicken or beef broth, cover and cook 15 minutes without removing the cover. The same recipe may be used for strawberry shortcake.

FRUIT CAKE.

Two pounds of seeded raisins, one pound of currants, one-fourth pound of candied citron, one tablespoonful of cinnamon, one of allspice, one of cloves, one or two nutmegs, five eggs, one cup of sour cream, one cup of melted butter, a teaspoonful and a half of soda, three cups of brown sugar, one cup of molasses or sorghum, flour to make this thick. Bake slowly three hours and a half. This makes a large cake that will last a year if one wished to keep it that long.

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

Miscellaneous Advertising.

Pain in the Side

Is a symptom of disease. It may be caused by Rheumatism, or by Neuralgia, but it usually indicates a disordered condition of the Stomach, Liver, or Kidneys. Ayer's Sarsaparilla corrects the action of the vital organs, and removes every trace of disease from the system.

Last fall and winter I suffered from a dull, heavy, pain in my side. I did not notice it much, at first, but it gradually grew worse until it became almost unbearable. During the latter part of this time, disorders of the Stomach and Liver increased my troubles. I began taking Ayer's Sarsaparilla, and, after faithfully continuing the use of this medicine for some months, the pain disappeared and I was completely cured.—Mrs. Augusta A. Forbush, Haverhill, Mass.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

HIRES' IMPROVED ROOT BEER. Packages, 25 cts. Makes 5 gallons of a delicious, sparkling and wholesome beverage. Sold by all druggists, or sent by mail on receipt of 25 cents. C. E. HIRES, 48 N. Delaware Ave., Philadelphia, Pa.

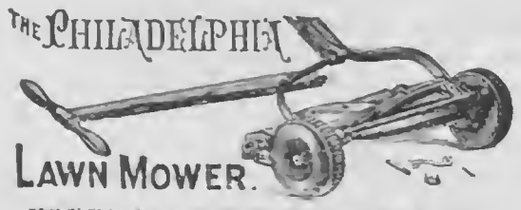
FARMERS,

Send for Circulars and Price List of The BARNES PAT. IRON FENCE, the cheapest and most durable fence in the world. Address THE BARNES PAT. IRON FENCE CO., EASTON, PA.

ALLEGER ORGANS you can get a strictly first class organ from $50 to $75, stool and book. Warranted 5 years. It will pay to send for circular before you buy. Address the manufacturer. **H. W. ALLEGER, Washington, New Jersey.**

AHEAD OF ALL COMPETITION.

1886.



FOURTEEN SIZES FOR HAND USE.
Weighing from 21 to 51 Pounds.
THREE SIZES FOR HORSE POWER.

Graham, Emlen & Passmore,

Patentees and Manufacturers,

631 Market St., Philadelphia, Pa.

Brewster's Patent Rein Holder.

Your lines are where you put them—not under horses' feet. One agent sold 12 doz. in five days; one dealer sold six doz. in 15 days. Samples worth $1.50 FREE. Write for terms.

HOME NEWS.

SATURDAY, June 19, 1886.

LOGAN is getting sarcastic on the Plumed Knight, "as the only politician in the country who is running the politics of the country just now," and "of England, too, for that matter." .....The Dominion Parliament is likely to meet for a short session in Oct. or Nov. and general elections are probable in Dec..... ....Cornell University is to have a Law School..... Of 445 samples of spices examined by Analyst Wood, of Mass., 170 were adulterated..... Australia having failed in the fight with her rabbit plague, an Adelaide University Prof. went to Europe for a couple of dozen affected with an infectious malady, intending to set them loose to spread the fatal disease. They died on the voyage, and another lot is ordered. Why not get the virus and inoculate Australian rabbits?..... .....The sheep butchers of this city—about 320—are on strike for higher wages; mutton has gone up two to three cents a pound. Near-by butchers doing a "booming" business. Armour is expected to ship mutton heavily from Chicago. A large number of sheep in the slaughter-houses here are dying, and still more suffering severely. Green "scabs" spoil the pelts.....The number of soldiers, disabled and dependent on their labor for support, to be benefited by the new Blair Pension Bill, is put at 33,105, involving an annual expenditure of $4,767,120, at the rate of $144 each, per year.....Biggest fire ever known there at Muscatine, Ia., Sunday—mostly lumber, 10,000,000 feet..... Mrs Samuel L. Vining, of St Louis, is to receive from the Government $1,000,000 awarded by the Court of Claims under the terms of the French Spoliation Bill. The family has always stuck to the claim. Several other awards have also been made..... On complaint of the State Board of Health 10 of the largest molasses dealers in Boston have been put under bail to wait trial for having adulterated the product with salts of tin—a dangerous poison.....The Capitol of this State, as originally planned, was to cost $4,000,000; it has already cost $17,000,000 and will cost several millions more before it is finished. What do farmer tax-payers think of the matter?....Representative Gen. Wheeler, of Alabama, to prevent the expunging of his speech from the Congressional Record, wishes to expunge from it all the cantankerous things he put in it against Stanton and Lincoln.....Tuesday, June 11, Michigan was 50 years a State. Joyous celebrations in all towns, especially at Lansing, the capital, where Gov. Alger "electrified an immense audience" by strictures on Jeff. Davis's recent utterances..... ....That Chicago aldermanic scandal grows worse; but in cases of bribery it is nearly impossible to prove legally what everybody knows to be a fact. Yerkes and his Philadelphia syndicate make a "cool" million by one stroke in the transaction—they take the $5,000,000 stock of the North Side Railway Corporation at 80—$4,000,000—and sell it at 100—$5,000,000....Another Philadelphia syndicate has just got control of the forfeited Broadway and Seventh Avenue surface road in this city, and propose to run it for themselves in spite of late legislation. Much complaint at dilatoriness of legal action in the matter..... The President has approved the act for the relief of ex-President Arthur for a defieiency in his accounts when Collector of this Port... Arthur is only so-so; wants to get out of the city; but his doctors fear ill-results.....Much visiting and dinner giving and receiving, and one grand reception by the "happy couple" at Washington.. .. .. The Maine Prohibition Convention at Portland, Thursday, nominated for Governor, Aaron Clark, a prominent Greenbacker in 1879, a farmer, 63 years old. Delegates present, 193, representing 14 out of the 16 counties in the State—the largest Prohibition Convention ever held. Ex-Gov. St. John, of Kansas, made a rousing speech. Convention roundly denounced both the old parties, and urged all to vote the straight Prohibition ticket ....A reign of terror in East St Louis. No police; treasury empty; burglary by night; highway robery by day; brutal assaults numerous, some fatal already, others likely to be; women openly insulted—the place in the hands of ruffians. Mayor anxious to do something: City Council won't move through fear of the expense.....The trials of the 31 Anarchists indicted at Chicago will begin June 21. The Congregational Club of the city has raised $6,000 for missionary work among the Bohemians and other non-English-speaking people in the city, with a view of preventing other outbreaks.....Gordon is now 50 delegates behind Bacon for the Governorship of Ga. His "brutally insulting" language in the joint discussions between the two has greatly injured him, and the discussions have been given up.. ....The Supreme Court of Ohio has decided the so-called "rump" Senate which unseated four Democratic Senators from Hamilton Co., giving their places to four Republicans, was legal, and the Dow Liquor Law, together with the other enactments passed by the "amended legislature" are therefore all right. Court, politically divided—three Republican judges for, two Democrats against. .....Thursday the House refused not only to pass, but even to discuss the tariff legislation as embodied in the Morrison bill. Here is an analysis of the vote: New England—Yeas, 3; nays, 20; not voting, 3. Middle States (excluding Maryland)—Yeas, 11; nays, 54; not voting, 4. Southern States—Yeas, 96; nays, 16; not voting, 8. Western States—Yeas, 30; nays, 58; not voting, 12. Pacific States—Yeas, none; nays, 90. Total—Yeas, 140; nays, 157; not voting, 27, of whom 26 were paired. Four Republicans voted to consider the bill, and 35 Democrats opposed it. The delegations from the following States voted solidly to consider the bill and therefore for alterations in the tariff in the direction of free trade: Arkansas, Florida, Georgia, Mississippi and Texas. The Representatives of California, Kansas, Maine, Nebraska, New Hampshire, New Jersey, Rhode Island, and Vermont voted solidly against consideration. One Alabama Representative voted against the bill. New York gave seven votes for, and 25 against. Ohio gave three votes for, and 18 against. Pennsylvania gave three votes for, and 22 against.....Richard A. Proctor, the astronomer and chess and whist expert, has come over the water to stay with us permanently—at St. Louis or thereabouts..... Congressman Weaver (J. B.) of Iowa, erstwhile the great Greenbacker, is ready to bury the Greenback organization, thinking "a great new political party" can be built out of the labor troubles.....Powderly has sent a "special circular" to all the K. of L., warning them that an effort will be made by politicians to capture the organization at the great convention to be held at Richmond, Va., in October.....A party of 10 French railway officials, representing every railway in France, are running about the country in palace cars on fast time getting points for the improvement of their own lines, which they already regard as "quite Americanized"..... .... Congress has increased the appropriation for the Labor Bureau from $53,000 to $92,000—the Cleveland convention so "ordered" it..... The Vermont Republican convention at Montpellier, Wednesday, was decidedly an Edmunds assembly—the largest ever held—630 delegates. E. J. Ormsbee, Edmunds' man, was nominated for Governor, Luke L. Poland, avowedly a Blaine man, getting only 44 votes. Ormsbee is 52, "a fair specimen of a Vermont lawyer."....Edmunds pretty certain of a re-election.....Vancouver, British Columbia, terminus of the Canadian Pacific railroad, was burnt Snuday—not a dozen out of its 500 houses left standing—its 3,000 inhabitants homeless—loss over $1,000,000. Little or nothing saved except the clothes on their backs. Going bravely to work to rebuild the place.....All over the country, especially in the large industrial centers, fervid meetings are being held to express sympathy with Irish Home Rule in the form of contributions toward the expenses of the approaching election. The opponents of Home Rule have nearly all the wealth of the three kingdoms, and its supporters must be at a great disadvantage without outside aid. Contributions have been liberal, not only from Irishmen here and decendants of Irishmen, but from a great many others of American and other origin, who give more or less either for political reasons or because they really sympathize with this endeavor to free a friendly people from the oppressions that have tormented them for centuries. Liberal contributions are also sent on from Canada, Australia and other places... ....The fishing trouble is probably over. The Canadian authorities have withdrawn the old instructions to the captains of the revenue cruisers and issued new ones which say nothing about the purchase of ice or bait, or the shipping of men from Canadian ports, or any other ground of complaint. It merely tells them to see that Americans do not fish within the three-mile limit. It is understood the Imperial Government insists that Canada must be more friendly. A mixed commission is likely to try to settle the fishery question once for all.... ..... Senator Edmunds has introduced, by request, a bill to incorporate the Maritime Canal Company, of Nicaragua, to construct and operate a ship canal by way of Lake Nicaragua and the river San Juan. The principal office of the company is to be in New York City, and its capital stock is to be not less than 500,000 or more than 1,000,000 shares of $100 each.....The Wisconsin Knights of Labor have gone boldly into politics and will nominate a full State ticket. .....The biggest crush ever seen at a public reception at the White House came yesterday to see Mrs. Cleveland in her wedding finery, and admire her beauty and grace. .....Texas has been drowned and buffeted with rain and wind storms during the week.. ....The Blair Educational Bill is dead for the session.....

FOREIGN NEWS.

SATURDAY, June 19, 1886.

INTENSE excitement about the approaching election in the United Kingdom. All the prominent men—Liberal, Union-Liberal, Radical and Conservative—have either issued manifestoes of opinions or plans, or delivered speeches embodying them. The "Grand Old Man" was never grander. By manifesto and speech he defines the issue as either "government of confidence, or government of force"—Gladstonism and Home Rule, or Salisburyism, and 20 years of coercion. He is greatly helped by the late Orange riots in Ireland (all quiet there now) and the extreme harshness of Salisbury's late utterances. The fight is settling down between these two—the others getting dwarfed into insignificance. Gladstone has just made a journey to Midlothian (capital Edinburg) which Scotch county he represents in Parliament, and in his 54 years of public life no such enthusiasm ever hailed him. The millions of Englishmen whom he has enfranchised are wild to help to rescue the millions of Irish still in distress. It must be borne in mind, however, that only the G. O. M.'s admirers flock to cheer him; his opponents—and he has lots and lots of the very bitterest sort—stay sullenly away. Throughout the United Kingdom it is "anything to beat Gladstone," whom many regard as a sort of "Antichrist" bound to ruin the glorious British Constitution and dismember the Empire. Yesterday he is said to have promised disestablishment to Dissenters if they help him to give Home Rule to the Irish. At present it is anybody's fight—with possibly brightening prospects for the "Old Parliamentary Hand."....In France the Assembly bill expelling the Princes, though amended to suit the Cabinet and, therefore, supported by it, is pretty certain to be defeated in the Senate, as the committee of nine appointed to consider it, have reported, six to three, against it. The Senate has become rather unpopular in France of late, and antagonism here is sure to cause greater unpopularity, and likely to lead to an attempt to abolish or change that body.....French vessels hoisted the French flag on the New Hebrides Islands in the Pacific; England vigorously but diplomatically protested; France has ordered the flag hauled down—of course it was intended to be only temporarily raised while the fleet punished the natives for recently massacring five Frenchmen.....Labor troubles in France are temporarily settled..... .....Ludwig, the deposed King of Bavaria, committed suicide by drowning himself in a lake near his palace prison. His attendant physician was drowned also either in trying to save him, or from remorse for having permitted him to do the deed—more likely the former, as there were marks on his face indicating that the King had struck him. King's physician from birth declares he was not insane—only eccentric. Others say he was mad, and that the condition of his brain after death proved it. He was much beloved by the country folks who are wild with excitement and suspicions of foul play. He was buried Thursday. His successor is his brother Otho, 10 years younger—31—who has been insane for a decade. Prince Luitpold will remain Regent, and doubtless he or his heirs will succeed to the throne, unless Prussia shall find some excuse for annexing the kingdom, as she has done with so many other minor German powers..... ....Chili, although it triumphed so completely over poor Peru, and seized on the Terrapaca nitrate beds and most of Peru's guano deposits, is not altogether happy. At the elections last Tuesday, 40 persons were killed and over 100 more or less severely wounded in a riot at Santiago de Chili. Latest advices say the elections are likely to favor the Liberals..... Peru is slowly recovering from its disastrous war with Chili. Caceres, the only general who didn't surrender, was quietly elected President the other day. It will take at least a generation to recover from the drubbing and spoliation the country suffered. It is now bankrupt, and the only hope is in foreign capital to develop the resources of the country and give employment to the people. The fertilizer wealth having been lost, no convenient way of getting "ready money" remains..... ... .Juarez Zelman has been elected President of the Argentine Republic which has been greatly developing its resources, especially its vast live stock interest, of late years.....

AGRICULTURAL NEWS.

SATURDAY, June 19, 1886.

A CANADIAN bullock and heifer lately landed in England, weighed, together, "close on 6,000 pounds."....For several weeks, 70 cars of strawberries a day have been shipped from Centralia, Illinois ....Three cases of death or severe injuries from cattle horns reported this week. It is thought there are at least 200 deaths a year from this cause in the whole country..... .....The wool trade of Chicago is growing very rapidly.....The fee for a license to deal in cider, hard or sweet, at Windsor, Ill., has been fixed at $1,000 a year. Evidently cider is not thought "harmless" there..... ....The liquor license fee at Joliet, Ill., has been fixed at $1,000.... ....Estimated improvements to the Duluth dock system aggregating an outlay of over $3,000,000, are under way. Going in for a big grain trade this Fall. . The Woman's Silk Culture Association of Philadelphia, Pa., issued their sixth annual report Thursday. It says that there is now an open market for the reeled silk which bears a value second only to the best silks of Italy. There is also an outlet for waste and cocoons. Ninety of the 380 silk mills in operation in this country are in Pennsylvania. Mrs. John Lucas was re-elected president.....At the great meeting of the American Association of Nurserymen, Florists and seedsmen in convention at Washington, Wednesday and Thursday, the following officers for the ensuing year were elected:—President, C. L. Watrous, of Iowa; first vice-president, M. A. Hunt, of Illinois; secretary, D. Wilmot Scott, of Illinois; treasurer, A. R. Whitney, of Illinois; executive committee, S. D. Willard of New York, U. B. Pearsall of Kansas, and George Weltz of Ohio. A resolution was adopted urging the passage of the Oleomargarine Bill pending before Congress.....The third meeting of the Fruit and Vegetable Growers' Association of the United States in convention at Columbus, Ohio, Thursday, adopted the Arnold system of preserving fruits by evaporation. C. H. Chilcoal, of Illinois, was elected president..... ....Congress will not repeal or reduce the tax on tobacco at this session.....W. A. Boies, of Marengo, Ill., the "Butter King" of America, and probable the largest maker and dealer in butter and cheese in the country, controlling the production of over 20 creameries near Marengo, and paying nearly $500,000 a year in wages, failed the other day, owing about $300,000, of which at least $40,000 are due to the farmers and patrons of his factories. His assets won't be over $64,000.....Charley" Blatz, of Chicago, a very large cheese dealer, has "sold" his business to a young man named C. S. Mauran. "Charley" owes $100,000, much of it to farmers who consigned goods to him, or sold them on time: his assets will probably be not over 25 cents on the dollar, though he claims they will be more.....Partly owing to these failures, Harton Gill's, of Big Foot, near Harvard, Ill., operating eight cheese factories, has failed—liabilities—mostly to farmers—$50,000; assets $10,000. Almost every farmer within a radius of 10 miles will lose from $50 to $300.....

Crops & Markets.

SATURDAY, June 19, 1886.

The first wheat of the present crop was offered at the Baltimore Exchange, on Wednesday. Grown in Rappahannock, Va., and sold for 80 cents a bushel—Fultz, "very green and wet;" a small lot."

Production of Minneapolis mills last week 145,200 barrels, against 135,530 the preceding week, and 46,512 the corresponding week in 1885. Flour quotations 10 cents lower than a week ago.

A small, black worm, a new-comer there this season, is devastating onions on the famous "Graycourt" and "black dirt meadows' near Middleton, Orange Co., N. Y. Whole fields ruined. Onion weevil also unusually troublesome. Usual crop 400,000 bushels; hardly half so much likely this year.

According to the Chicago Board of Trade's Tuesday report, the number of bushels of grain in store in the United States and Canada June 12, and the increase or decrease as compared with the previous, were; wheat, 32,458,681, decrease, 1,006,858; corn, 9,387,200, increase, 575,704; oats, 2,595,298, increase, 423,307,; rye, 304,328, increase, 21,535; barley, 244,476, decrease, 51,569. The amount in Chicago elevators was: Wheat, 8,300,929; corn, 2,301,285; oats, 373,904; rye, 17,781; barley, 30,363.

THE Financial Chronicle, examining the Ag'l Department's last cotton report, finds that an increase os 1.52 per cent. is indicated, making the area for this year 18,994,000 acres. The reports of condition appear to indicate a very hopeful prospect, though more depends

upon climatic influences this season than is usual, because of the backward state of the plant in more than half of the area. It is reported that the condition is as good as it was last year, or better, in States having about 7,400,000 acres in cotton, while in States having about 11,000,000 acres the condition is at present more dependent upon climatic influences than it was a year ago. It may be roughly inferred that, with favorable weather, the yield this year may range from 6,300,000 to 6,700,000 bales if the season should be decidedly favorable.

For the last month prices of cattle have been rather unsteady. It is thought there will be little change in the next few months, though an advance is more probable than a decline. The low prices are attributed by many to the dressed beef trade. This is entirely in the hands of a few unscrupulous men. The Eastern shipments have undoubtedly lowered the prices of Eastern stock, and the great slaughter kings of the West are so manipulating the Western markets as to control prices there, and who expects they would pay a cent more than absolutely necessary? Men of Armour's kind, controlling vast capital and thoroughly unscrupulous in its use within the limits of "business morality," are dangerous to the public, especially when the combination of a few of them can establish a monopoly in such a business as the dressed meat trade. Owing to the great injury done by January blizzards in Texas, and the still severer losses by the recent terrible drought there, the supply of beeves from that State is likely to fall much short of early anticipations. In New Mexico, Colorado and Kansas there has also been much need of rain on the plains, so the pastures are short and parched, and stock are not doing well. Complaints of dry weather come from the Northwest also. As a whole, range cattle have not been doing well, and unless things change a good deal, much good beef can't come off the ranges next Fall; hence the prospect of prices for "States" cattle ought to be brighter.

There's no doubt that the firm stand taken by wool growers has helped to stiffen the price of wool this year. It is estimated that prices would be some cents lower had they rushed to sell at any figure. It is very desirable that large wool growers and wool growers' associations should take a firm stand as regards the prices for their wools. Commercial papers are deprecating high prices and predicting disasterous results, but they speak for their patrons—the dealers and manufacturers—and growers should be cautious in accepting their teachings. St. Louis has lately aspired to become a great wool market, and "blowed" a great deal, in advance, about an auction sale held there the other day; but by all reports it was a fizzle—Boston agrees with Chicago on this point. Prices in the Eastern markets are higher than a week ago, owing to excitement in the Western markets, where prices for the new clip are relatively higher than those lately commanded by wool at the seaboard. Moreover, the great June wool sales in London have opened with lively competition, and prices for cross-bred wool are 5 to 10 and for Merino at least 15 per cent. above those at the close of the last series of sales. Manufacturers are willing to pay now without haggling, prices that couldn't tempt them a fortnight ago. West, local speculators have been buying freely in competition with Eastern dealers and manufacturers, and a good deal of the clip has already left farmers' hands. In Boston, prices have gone up one to two cents per pound this week, and even now wool there is relatively lower than the new clip in the country.

Current quotations for leading sorts there are as follows:

Living Wonders.

THE wife of a clergyman at Fulton, New York, writes:—"Within the past seven years my husband has had two shocks of paralysis. His pulse was fast as I could count—his breath twice to my once. His body seemed a burden to him."

A month later came this report:—"His hands, which were bloodless and cold, are now natural, and the veins stand out, showing a renewed circulation."

Four months later was this further report:—"My husband continues to improve. About the last of July his left leg, which had a paralytic limp, straightened out, so that he now steps evenly on both legs. The paralytic condition of the right hand and the left side of his face, which were affected by the last shock, has also disappeared."

The wife of a clergyman in Sandersville, Georgia, writes:—"Was paralyzed in body and brain. . . I am now the happiest being you ever beheld. Compound Oxygen wrought wonders for me. I am a marvel and a wonder to the whole country."

A daughter of Colonel Hornbrook, of Wheeling, West Virginia, a wreck from paralysis, was completely restored to health by the use of the Compound Oxygen Treatment.

Dr. J. W. Williamson, of Boydtown, Virginia, reports a cure of one of his patients, who "had but little use of his right side; could neither walk, talk, nor write. Had not been able to ride for five years. He now talks, walks, and rides well."

W. R. Flanders, Esq., writes from North Thetford, Vermont:—"A spinal complaint partially paralyzed my limbs, so that their extremities were dead to the touch. Compound Oxygen has restored my strength, not only of body but of mind."

A clergyman of Allamakee, Iowa, writes:—"Your Compound Oxygen has worked like a charm. After three weeks use I have increase of weight, clear mental horizon, freedom from incipient paralytic attacks, and good rest. What more could I ask?"

"Compound Oxygen—Its Mode of Action and Results," is the title of a brochure of nearly two hundred pages. It is published by Drs. STARKEY & PALEN, 1529 Arch St., Phila., Pa., giving full information as to the means by which these and similar results are secured, and will be mailed free to any address on application.

MARKETS BY TELEGRAPH.

SATURDAY, June 19, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 2¼c. lower—a fall of 5¼c. in two weeks, or rather nine days, as the drop didn't start till Thursday of the previous week. No. 2 Spring, 2¼c. lower—a fall of 5¾c. in nine days. Corn, ⅞c. lower. Oats, ⅝c. lower. Pork, 12½c. lower. Cattle, shippers 50c. lower; stockers, 35c. lower; "mixed," 15c. lower; "bulk," 5c. lower; Texans, unchanged. Hogs, a trifle higher. Sheep, Texans, from 10c. to 40c. higher; lambs, 50c. higher on medium grades; 50c. lower on the best.

WHEAT, active; Sales ranged: June, 70¾@71¾c; July, 72¼@73c; August, 73¾@74¼c; No. 2 Spring, 71¼@71⅜c; No. 3 Spring, 61@62c. CORN weak; sales: Cash, quoted 33¾c; June, at 33½@34¼c; July, 34¼@35¼c; August, 36½@36¾c. OATS.—Lower. Sales ranged: Cash, 26@27½c; July, 27¼@27¼c; August, 25¾@26c. RYE.—No. 2, at 55¼c. BARLEY.—No 2, at 53c. MESS PORK.—Cash, at $8 67½@8 70; July, $8 65@8 67½; August, $8 72½@8 77½. LARD.—Cash, 6 05@6 07½c; July, 6 10@6 15c; August at 6 20@6 23c. BULK MEATS.—shoulders at $4 85@4 90; short rib sides, at $5 40@5 45; Short Clear sides, at 5 80@5 85. CATTLE—Market easier and very slow. Shipping steers, at $4 00@5 50; stockers and feeders, $2 40@4 40; cows, bulls and mixed at $1 50@4 10; bulk, $2 75@3 25; through Texas cattle, $3 00@4 00. HOGS.—Market slow. Rough and mixed, $3 90@4 12½; packing and shipping at $4 10@4 30; light, $3 95@4 20; skips, $2 50@3 50. SHEEP.—Market firm and strong: Natives, $2 00@4 50; Texans, at $2 25@3 40; Lambs, per head, $2 00@3 00.

ST. LOUIS.—Compared with cash prices a week ago, No. 2 red wheat is 1c. lower. Corn, ¼c. lower. Oats, ⅜c. higher. Butter, unchanged. Eggs, ½c. lower. Flaxseed steady. Wool, all grades unchanged, except "fine light," "heavy" and black, which lose 1c. on the best sorts, though the other kinds on each are steady. Pork, 10c. lower. Cattle, just a shade lower on the best kinds; steady on the others. Hogs, light, 10c. higher; others unchanged. Sheep, steady.

WHEAT.—Active; No. 2 Red, Cash, 75c; July at 73@73¾c; August, 73¾@74¼c; September at 75¼@75c. CORN.—Dull; No. 2 mixed Cash, quoted at 30¾@31¼c; July, 31@31¼c; August at 32@32½c; September, 32¾c. OATS.—Dead, dull and prices nominal. NO. 2 mixed, Cash, at 24¾c; July, at 25c; August at 24¼c. RYE at 53c. BARLEY.—No market. BUTTER.—Active and steady; Creamery, 14@15c; dairy, 11@13c. EGGS.—In moderate demand at 9c. per doz. FLAXSEED.—Firm at $1 01. BRAN strong at 45@46c. CORN MEAL—Firm at $2 05. WOOL.—Active and firm; medium clothing at 30@34½c; combing at 22@23½c; low and coarse at 18@20c; fine, light, at 18@22c; heavy, at 16@20c; black at 11@20c. PROVISIONS.—Quiet. PORK weak at $8 90. LARD.—Nominal at 5 75c. Bacon firm; long clear, at 6.05c; short ribs, at 6.30c; short clear, 6.25@6.30c. Hams very firm at 10½@12c. CATTLE.—Market firm; Good to Choice Native Shipping Steers, at $5 15@5 50; Native Common to Fair, $4 40@4 80; Butchers Steers, $3 50@4 50; Cows and Heifers, at $2 50@3 75; Stockers and Feeders, $3 25@4 60; Grass Texas, $2 25@3 85. HOGS.—Market active and steady; Light, at $4 00@4 10; Packing, at $3 90@4 10; Heavy, $4 15@4 25. SHEEP.—Market steady at $2 25@4 25.

BOSTON.—CORN.—Steamer yellow, at 49c—c, and steamer mixed at 48c—c. OATS.—No. 2 white, at 41½@41¾c per bushel, and fancy white and barley, 44@45c, per bushel as to quality. Rye, 65c. per bushel. Bran, at $14@15 for Spring and $16 50 for Winter; fine feed and middlings, at $14 00@19 00 and cotton seed meal at $23 00 on spot and $22 00 per ton to arrive. HAY AND STRAW.—Hay quiet at $18 per ton for choice and fancy; fair to good, at $16 00@17 00, fine, at $15 00@16 00, and $9 00@13 00 for poor and damaged; Western choice, $16 00@17 00; do fair to good $14@15. STRAW—Rye straw is held at $23 00@22 00 for choice, and $14@18 for common to good. Swale hay, $10@11; Oat straw, at $10@11 per ton. PRODUCE.—BUTTER.—Northern and Eastern creamery, extra, 15½@16c; extra firsts, 16¼@17½c; firsts, 15@16c; Western creamery, 16@18c, for extra firsts to first; firsts, 14@15c; Northern dairy, 15@17c, for Vermont extra firsts to extra, firsts, at 13@14c; seconds, 12@13c; Western dairy, 13@14c, for firsts; seconds, 9@11; imitation creamery, 11@13c, for extra firsts to extra; ladle packed, 10@12c, for extra firsts to extra; firsts, at 8@9c; seconds, at 7@8c; grease, at 3@4c. NEW CHEESE.—New York and Vermont extra, 8c; do. do. firsts, 6@7c; do. do. seconds, 4@5c.; Western extra 7@8c; do. firsts, 5@6c. For the Young.

A MEMORY.

By the meadow bars together,
While the sun sank low,
Mary dear and I were standing,
In the long ago.

Ah! her eyes were brown and tender,
As she looked at me;
Round us kindly dropped the shadows—
There were none to see.

Well, indeed, do I remember,
Life was fair and young;
Time's ax had not left the grindstone,
Trouble's song unsung.

At my side her fair head rested,
As I held the pail;
Eagerly her bright eyes glistened,
As she switched her tail.

Switched her tail? Why yes; I'll tell you—
Now I'll make you laugh:—
I was but a dreaming milkman,
She—a Jersey calf.

Now for the plows. I have been hunting through the words pretty carefully. It is a great surprise to me to learn that there were so many words locked up in those letters. As I figure, we have found over 105,000 words. This would fill 36 pages of the RURAL. The paper covered about 1,200 square feet. If cut into strips six inches wide it would reach nearly half a mile.

The longest list of correct words from any boy came from

James A. Leland,
Kent Co., Michigan.

The longest list from any girl came from

Abbie Ward,
Monroe Co., N. Y.

These lists were very well prepared and there were few words to be taken out.

SOME of the Cousins sent in very long lists, but I found that many of the words were not allowable. The greatest trouble was that a double e or a double t would crowd in. You will remember that there is only one e and one t in "Clinton Chilled Plow." I had to take those words out, and that made the lists shorter. Then some of you forgot what I said about using a word like "hide," that is spelled in one way, but used with two meanings. Take it all together, though, the work was very well done, and I want to praise you all for the way you have worked. I have always thought my boys and girls were pretty smart, but I never was so sure of it before. I am sorry we cannot send a plow to all who tried so hard. I am inclined to think Woodward & Son would feel like doing it if they knew how hard you have worked. All those who tried and failed should never be discouraged. We have learned a good deal about spelling, anyway. One thing I forgot to say is that the majority of the lists came from girls.

Be careful how you stand and where you stand. I saw a woman the other day who came very near killing her baby. She stood on a ferry boat, with the baby in her arms, near a swinging door. She thought the door was fastened because it was shut, so she leaned up against it. It was not fastened at all but opened beneath her weight and gave her such a start that she could not keep on her feet. She staggered a few steps and then fell, dropping the baby on the floor. The baby was not hurt, but it was almost a miracle that she did not fall upon it and crush the little thing. Be careful now about leaning up against unstable things. It pays pretty well to keep our feet under us. I don't like to see these people who are always looking about for a good place to lean. When a boy once starts into this habit he never will get over it. All through life he will be looking out for a good place to rest, and while he is hunting for somebody to lean upon, the good things of life will all rush by him. Stand up straight boys and be your own walking sticks.

When I was a boy there used to be an old lady who gave me lots of advice. She had a very queer hobby; she thought people did not blow their noses half enough. Whenever she found a child doing nothing she would say "now just take out your handkerchief and give your nose a good blowing." Some of you will laugh at this, yet it was very good advice as I have often proved. As a rule, people don't blow their noses half enough. I am well satisfied that there would be much less catarrh, headache and other head troubles if people would keep their noses clean. Some people never carry handkerchiefs. That is a sure sign that they don't care much for their health. Carry a handkerchief and use it.

The fields and woods are at their best now. Make the best of this beautiful season. When Summer comes with its heat and dust we shall lose the freshness that now covers everything. The best way, after all, is to make the most of each season as it comes. Enlarge the good things of the present instead of wishing for something to come in the future. "Live for to-day!" That is a good motto.

Near a railroad over which I ride a good deal lives a dog. He looks something like a bull dog, black and white, and not very large. Every time the train comes by he rushes out of the house and runs a race with the engine. He runs with all his might at the side of the cars, and seems to feel badly enough when we shoot past him. Of course he can't keep up—he ought to know it by this time, but still out he comes and runs as hard as ever. When he gets to be an old dog he will have more sense. His legs will get stiff and he will know enough to stay where he is comfortable and let the engine go. Did you ever see a boy or girl like this foolish dog? I have. They don't try to race with engines, but they try, time after time, to do things which a little thinking would prove ridiculous. Think more about your work or play. Nothing of any value can be done in a minute. We would have no respect for a cat or a dog that was caught in the same trap twice. What shall we say about ourselves if we do a foolish thing twice?

NOTES FROM THE COUSINS.

I NOTICED that A. E. Wakeman, fears he has failed to sprout the Canna seeds found in the Rural Treasures. I would say, this seed is almost impossible to start unless it has boiling water poured over it and remains in soak over night. I always treat them so, and now have two fine plants from as many seeds found in the Rural Treasures. AUNT EM.

DEAR UNCLE MARK: I thought it was about time I wrote to you or you will forget me. My Brother Norman wants to join the Y. H. Club. He is nine years old. Thanks for the seed you sent me. A week from now it is vacation. I like to go to school, though I am always glad when vacation comes. I take care of the school house now. I did not get but $5 for 10 weeks of school this term. We have had bad luck with our chickens and hens. A skunk carried off 12 chickens and five hens. Can you tell me how to catch him? He is too smart for a steel trap.

Yours truly, RALPH SAWYER.
W. Medway, Mass.

[Try the box-trap for the skunk. I used to "blow the organ" in church when I was a boy and only got $4 a year for it. So you are earning more money than I did.—U. M.]

UNCLE MARK: A little girl, Retta M. Avery, says "she wishes some Cousin would write to her." May I be a Cousin, and may I write to her through your paper? My Papa takes your paper, and I sent in a list of words last week. Mamma did not think I had enough words to get the prize, but thought my name would be among the others, as having tried. My little brother died the day he was six-and-one-half years old; and my sister is too old to help me. I am the same age as Retta. Our school closes this week, and I intend to recite a piece from the RURAL called, "A Primitive Churn." I think it may make some fun. I, too, have been making a scrap-book. Our teacher gives us beautiful pictures, for perfect lessons. Mine is full now. If Retta will write to me, through the mail, I will reply.

HATTIE BELLE HOTCHKISS.
West Cheshire, Conn.
Care of C. F. Hotchkiss.

[I am glad you wrote, and I hope you will get an answer.—U. M.]

DEAR UNCLE MARK: My Pa takes the RURAL. I read it with much pleasure and some profit. We planted the Rural seeds. Some of them are growing nicely. The cutworms and moles destroyed the largest share, so we had to plant the ground to something else. My Grandma gave me nine duck eggs. I set them under a hen, and she hatched them all, but one died. The eight are doing nicely. I have two young crows. They are very mischievous. My Pa has a nice Arabian mare, and she has a nice colt. We live on a small farm, 15 miles from Grand Rapids. I am learning stenography of my brother, who teaches it in Oakland, Cal. He sends the lessons to me on cards. JAMES A. LELAND.
Kent Co., Mich.

DEAR UNCLE MARK: My sister Mary takes the paper. I am a girl, 13 years old. I live on a farm. Pa has five cows and five young calves, seven horses, two working teams, three colts and six pigs. My sister has 39 nice little chickens, and she has three hens hatching on chicken eggs and two hens setting on turkey eggs. She has two turkey hens and a gobbler. One of her hens has laid 38 eggs, and the other one has laid three. She has a nice flock of chickens. NELLIE M. SANKEY.
Clearfield Co., Pa.

DEAR UNCLE MARK: Sister and myself have been reading the Cousins' letters and of their other doings, and we have become so very hungry to become members of the Y. H. C. If you will take us in we will write you often of our doings. Papa has taken the R. N.-Y. the last six years, and the whole family read it and believe in it. I am 11 years old next birthday, and sister is eight. We go to school 1½ miles. Papa carries on mixed farming nine miles from Macomb. He has horses, cows, hogs, turkeys, chickens, ducks, and we have a prospect for a large crop of all kinds of berries. There are seven in our family. MARY J. & NELLY BAYMILLER.
Macomb, McDonough Co., Ill.

[We want to know more about your county.]

DEAR UNCLE MARK: It has been a long time since I have written to you. I went on a visit to Indiana, and I liked it very well. I live in a mountainous country and I like it better than a level country; the water is better. It is nice growing weather and everything looks nice. We raise all kinds of fruit: apples, peaches, pears, quinces, plums, cherries, grapes, raspberries, currants and gooseberries, and strawberries and blackberries. I would like to know what is good for currant and gooseberry worms. Pa has 15 cows, and I help milk them, and we have six horses and 13 hogs and 15 pigs and 50 hens and 150 chickens and 21 turkeys, 40 young ones, and 12 geese and 15 goslings and eight ducks and 10 young ducks. We have two dogs, Jack and Towser, and two cats, Tom and Charlie.

Your niece, N. E. WOODFORD.
Alpina, W. Va.

[Hellebore, powdered, mixed in water and sprayed on the bushes, will kill the worms.—U. M.]

DEAR UNCLE MARK: I would like to tell you a little about our home in Nebraska. It is five miles south of Gordon, and the Niobrara River is about the same distance south of us. This country is begining to settle up very fast. There are several persons who came from New York this Spring. My father came here about 18 months ago, and took a homestead and brought logs from the River and commenced building a log house. It was the first that was put up in this township. I like to write letters, I write to my Pa, he is working in Mississippi and he says he likes to get my letters. We like this place, but it was the middle of August before Ma and the family came from Minnesota and it was too late for a garden. I expect to have a garden this year. My brother takes the RURAL and got the seeds and will give them a fair chance.

Your neice, MARY JULIA MURPHY.
Gordon, Nebraska.

DEAR UNCLE MARK: I have long been thinking I would write to you, but I could not get up enough courage. I am 13 years old and have a brother 10. We have been to school all the time, but have been setting strawberry plants for the last two days. We picked, last year, from 2½ acres, 19,000 quarts, and have three acres to pick this year, also three acres of raspberries, which look promising. My Papa keeps a yard of bees, containing 100 swarms, which were looking very well last Fall when we shut them up in a stone house, but have died out some during the last dreary Winter. I have got one swarm and 32 chickens, 12 of which are Brown Leghorns and the other 20 Dark Brahmas. The cherry and apple trees are in full bloom here and will have a good crop if we do not get a frost.

Yours truly, JOHNNIE R. GILES.

[I don't think I am so terrible that people must wait for courage in order to write to me—I hope not, anyway. Too bad about the bees.—U. M.]

THE TUSCARORA INDIANS.

IN reading accounts of the troubles between the whites and the Indians in the far West, it is pleasant to hear about those tribes who live undisturbed on reservations in the Eastern States. Among these the Tuscarora tribe, numbering 430 persons, may be mentioned, whose home is on the Mountain Ridge, and some distance eastward, in the town of Lewiston, Niagara Co., N. Y. Here they own, 6,240 acres of the most desirable land in the State.

History says, "The Tuscaroras formerly lived in North Carolina. When obliged to leave their homes in that State, they turned their steps northward, and in 1712 came to Central New York, and built their wigwams on unoccupied ground near the Iriquois, a company of five tribes, who had united their interests for mutual protection and defense. The Tuscaroras were kindly received, and invited to join them, which they did gladly. Afterward these tribes were called "The Six Nations." Mohawks, Cayugas, Oneidas, Onondagas, Senecas, and Tuscaroras lived near each other contentedly until the Revolutionary War. Then some of the Tuscaroras, who were in sympathy with the British, stole away to Canada, and were active in the great conflict. At its close, they set out to return to their former hunting grounds in Central New York. Stopping at Lewiston to visit some Senecas who owned land on the Mountain Ridge, they decided to stay there, and a piece of land one mile square was given to them by their hospitable entertainers. Wishing to own a greater tract of hunting ground, the Holland Land Company kindly gave them two square miles of land adjoining their homes. Years went happily on, as then there were but few white men in the country to interfere with their pursuits. Again the want of more land began to be felt by them, but it was now too valuable to be given away; so they raised a small amount of money, and bought the desired tract from the Holland Land Company in 1808. It was densely wooded, and small game was abundant. The region was infested with wolves; consequently but few deer were found. If a deer went to the lake or river to drink, some prowling wolf would frighten it and make it take refuge in the water. Its enemy waited in the thicket until the poor, timid creature, tired with fruitless swimming, ventured to the shore, where it was soon killed and devoured. When the wolves were hunted and driven away, deer became plenty, bears were often shot and furnished food for the hunter. Occasionally a panther crossed his path, and was regarded as a dangerous foe. Fish were unusually plentiful in the creeks that ran into Niagara River. Thickly shaded with woods, they did not dry up in Summer, as small streams do at the present day. In March and April that delicious fish, the pike, was eagerly watched for and speared by the Indians. Flocks of swans, cranes and wild geese lived around Niagara River, and wild ducks and gulls were there in immense numbers. As the country became settled and the woods cleared off, game gradually disappeared. Wild ducks are still abundant on Niagara River, but hunting them is laborious work, and is often attended with danger. The Tuscaroras no longer depend on hunting for support, but are engaged in cultivating their farms. In this work many of them have been very successful. Land is allotted to the head of a family and subdivided among the members of the family. Where a family runs out, the land goes back to the commonality, and is again allotted to a new family. Some of the land is leased to white neighbors, who live near. A religious society was organized among the Tuscaroras in 1805. Various missionaries labored there, aiding them to acquire knowledge of the true God, the Great Spirit, who created all things. The Rev. Mr. Rockwood was sent to them in 1837, by the Board of Missions, and lived on the reservation 30 years. As many whites attended the Indian church, the sermon was preached in English as well as in Indian language. The minister spoke a sentence in English, then paused a moment, during which it was quickly translated into the Tuscarora tongue by an expert interpreter. In this way sentence by sentence, the sermon was translated to the people, who gladly listened to the Gospel's joyful sound. Now there are two churches on the Reservation, whose bells peal forth sweet tones that echo among the ravines that furrow the Mountain Ridge, proclaiming this to be a Sabbath-keeping people. The public schools, taught by native teachers, are well conducted. The older scholars are frequently sent to schools in the neighboring cities to complete their studies. These Children of Nature are gifted with fine vocal powers. One of them, Mr. Samuel Jacobs, taught singing schools among them for 30 years. They are lovers of song, and their singing is long remembered by those who hear it. Several of them are favorites in the concert room. Great attention is given to instrumental music, and there are two well organized musical bands, whose services are often sought on holidays.

This tribe still has its chiefs, after the manner of the olden times. There are 15 chiefs. Chief John Mount Pleasant, elected in 1827, when but 17 years of age, is the highest in rank. The other chiefs are his counsellors. Each has a tribal name, such as United States Eagle, French Beaver, etc. This tribe is composed of six classes, named as follows:—Bear, Wolf, Beaver, Snipe, Mudturtle and Eel. People of one class marry those of another, as each class is made up of relatives. Besides the chiefs, most every one has a tribal or Indian name. These are given to perpetuate the old customs of the race long before white men lived in this country. An annual picnic for the benefit of the Sabbath Schools of the Reservation is held during the month of August in a fine maple grove, where sap-troughs, lying at the roots of the trees, indicate that maple sugar-making is still carried on in the Spring. This picnic is largely attended by the whites, who are entertained with speaking, and also choice vocal and instrumental music by these accomplished and happy aborigines. SOPHIA C. GARRETT.

PERSONALS.

ARCHIBALD FORBES, the English war correspondent, is now in Washington for the purpose of being married to a daughter of General Meigs.

SAMUEL J. TILDEN is as bright as ever, mentally, and was able to walk from his carriage to his yacht, the other day, steadily without help or support.

E. P. WHIPPLE, critic, lecturer and distinguished man of letters, died at his home in Boston Thursday night, of pneumonia, after an illness of several weeks. Born March 8, 1819.

THAT young Prince Leopold, grandson of the Emperor of Brazil, is a midshipman on a Brazilian frigate here, and his visit is entirely unofficial, and he is to be treated not as a prince, but as an ordinary midshipman—with a difference.

LIEUT-GOV. JONES—Jones of Binghampton who pays-the-freight—has won golden opinions while presiding in the New York State Senate, and while Acting Governor during Hill's absence, and there is some talk of "booming" him for Governor at next election.

FROM a large number of reports, it is very evident that the fine old Emperor William, of Germany, is near his end. He is very weak, has frequent fainting spells, and although he has had marvelous rallies during the last 10 years, he cannot expect many more at the age of 89.

SPEAKING of the great Russian Foreign Minister, Count Paul Vasili says: "M. de Giers is not popular; he is shy and reserved. But he is thoroughly patriotic, is an admirable tactician and conceals an iron will under a supple exterior. He speaks little, but he acts."

COLONEL FREDERICK D. GRANT is spending the greater part of his time putting into shape and editing his father's journal of that triumphant tour around the world, which brought the American soldier into personal communication with nearly all his famous contemporaries.

AMERICAN Miss Grant was to marry English Earl Cairns—Lord Garmoyle, who had to pay $50,000 for jilting pretty actress Fortescue. The engagement is broken off, however, because Miss G., or her people, are unwilling or unable to give money enough to satisfy his "lordship's" debts or desires.

"THE second term movement is fairly launched," is a remark often heard in Washington. Mrs. Cleveland is smart, energetic and ambitious, and will hardly be content with half a term in the White House; hence a change of policy is expected on her husband's part to bring him into closer relations with the mass of his party.

REPRESENTATIVE W. S. HOLLMAN, the "Great Objector," *alias* the "Treasury Watchdog," received his 15th Congressional nomination, Wednesday, from the Fourth Indiana District, by a vote of 121 to 50, after four votes had been taken. Reports of strong opposition made him quit Washington suddenly the other day, and hurry home "to mind his fences."

HON. ROBERT M. T. HUNTER, of Va., has been confirmed Collector of the Port of Tappahonnock River, a sleepy place, whose commerce brings the Collector $250 a year. He was a Representative in Congress for 10 years and a Senator for 14, before the war, Confederate Secretary of State during the war, and State Senator after it—a man of great abilities and unblemished honor.

PRINCE ALEXANDER, of Bulgaria, formerly despised everywhere, but who by gallantry, dash and generalship won victory, territory and renown in the late brief campaign against Servia, opened in person the first Bulgarian-Rumelian Assembly at Sofia, last week. "United Bulgaria," said he, "has earned an honorable place among the nations. We are justified in hoping for a brilliant future."

CLARENCE A. SEWARD, associate of Roscoe Conkling in the Broadway Surface investigation, last Tuesday, got from Controller Chapin of this State, $15,000 of the $21,000 he claims for his services. The payment bankrupted the treasury so far as concerns the appropriations made for the investigation; the other $6,000 must be appropriated by the next Legislature. Seward can have a good time on the European trip on which he started this morning.

ONE of the daughters of the Comte de Paris married the heir to the throne of Portugal the other day, and another is to marry the heir to the throne of Italy. Queen Victoria has offered the Comte the palace formerly occupied by Louis Phillip, should he be expelled, and a number of officers associated with him when he served on McClellan's staff during our war, have invited him to make his home here. The heir of the Orleanists and Legitimists can't live far from Paris, however,

Miscellaneous Advertising.

FOR THE HARVEST,

Which will soon be upon us, we offer to our FARMERS the following special TOOLS and MACHINES of our latest and most approved pattern:

The CROWN MOWER,
The MONITOR Hay Rake,
The Burdick Hay Tedder,
Our Improved Hay Loader,

with the largest assortment of small TOOLS and MACHINES for the Hay and Grain Fields to be found in this country.

Send for descriptive circulars of the above modern implements as well as any and every requisite in the line of Tools, Fertilizers and Seeds.

A visit of inspection is invited to our extensive warehouses at **189 and 191 Water Street.**

R. H. ALLEN COMPANY,
New York.

PEARSON'S FERTILIZERS.

High Grade. Reliable. Lasting.

Manufactured in dry condition, thereby assuring full weight of fertilizing material. Most flattering results where used side by side with other preparations. Where there are no agents for these Fertilizers, orders direct to the manufacturers will receive prompt attention. **JOHN M. PEARSON, Hudson, N. Y.**

Send for catalogue.

Entered at the Post-office at New York City, N. Y. as second-class mail matter.

Humorous.

AN ode to a goat may be called a nanny versary poem.

IN answer to Joe Cook's question, "Is life worth living?" we reply that it all depends on the liver.

"MAMMA," said a little girl at breakfast, "I don't like this milk—I b'lieve it 'as been skinned."

FARMER—"You say you are willing to do anything?" Jolly Tramp—"In course—anything but work."

"WHAT'S in a name?" a recent traveler was heard to exclaim. "Why, about the hottest country on the globe is Chili."

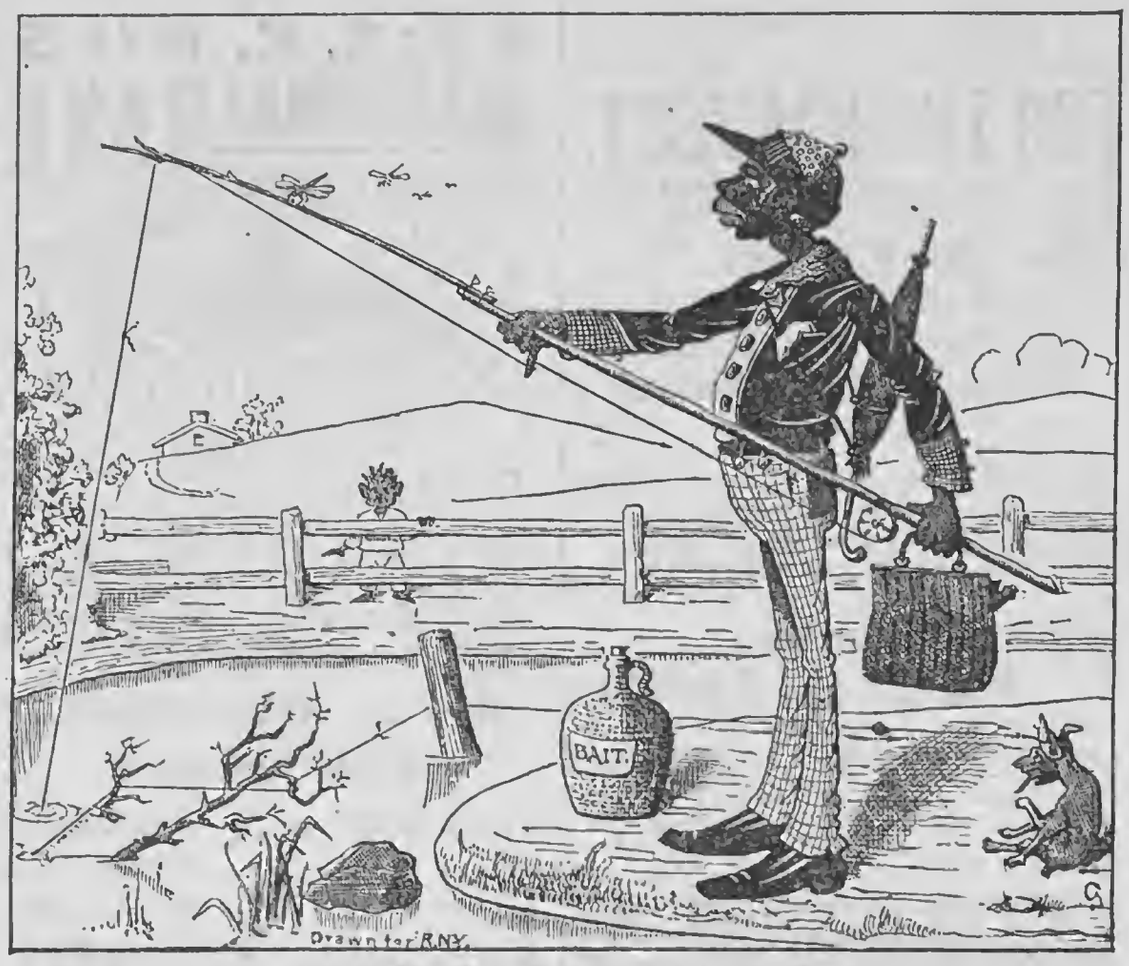
"CAN February March?" asked the punster with a sickly smile. "Perhaps not," replied the quiet man, "but April May."

SOME one says the bicycle season is backward. We have good authority for saying that the bicycle fall is usually forward.

WORKING OVER-TIME.—A Florida hen having laid two eggs in one day, it is understood she will be boycotted by the Knights of Labor for over production.

MRS. MURPHY—"I say, Pat, what would yez do if ther ould house would tumble on yez an' crush yez to death?" Pat (complacently) "Faix, I'd fly for me loife!"

MISTRESS to new cook: "On Wednesdays and Saturdays I shall go to market with you." New cook: "Very well mum; but who's a-goin' to carry the basket the other days?"



NEARSIGHTED AND STARTLED ANGLER.

"Ef I warn't shure dey aint nuffin' but bullheads in dish yer crick, I'd fink I'd ketched a shark—run home chile an' git de pitchfo'k."

Sheep Husbandry.

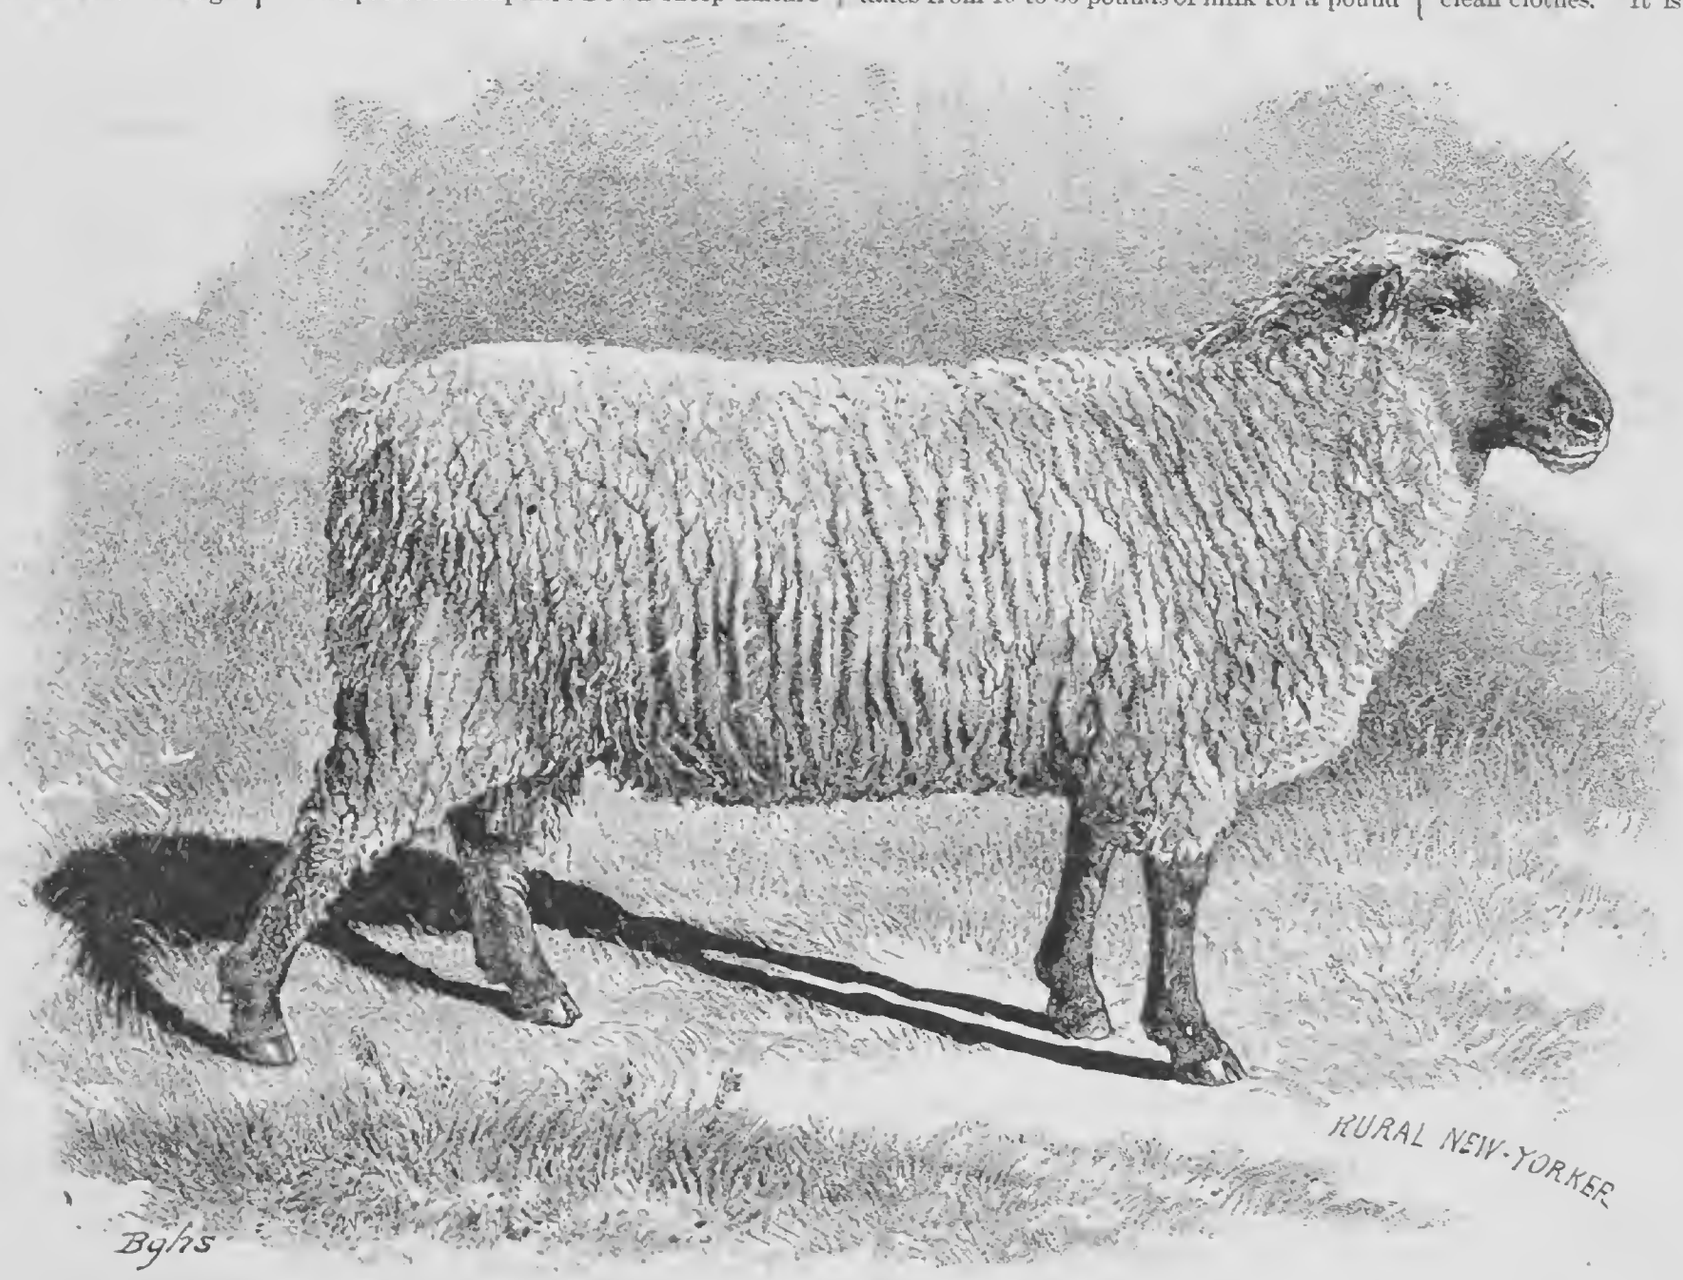
HAMPSHIRE DOWN SHEEP.

THE word "down" or "downs," as applied to land, is used in England to indicate a large, open tract of poor, untilled land, generally of a dry, hilly, sandy nature, covered here and there with heath or furze, and economically used only for pasture—almost exclusively for sheep. Probably the largest tract of this kind is a range of low hills, underlaid with chalk, extending or rather cropping up almost continuously, though Sussex, Hampshire and Dorset, in the extreme south of England. The hills slope gradually to the English Channel on the south, and merge into rich, cultivated lands on the north. Though unprofitable for tillage, they are covered with a rich sweet, short, dense herbage, affording an excellent pasture to the large flocks of sheep which have been raised there for many centuries. On these "downs" originated three of the best breeds of native sheep in England—the South Down in Sussex, the Hampshire Down in Hampshire, bordering on Sussex on the west; and the Dorset, in the county of that name adjoining the western boundary of Hampshire. The sheep of the entire region were, doubtless, originally horned, but the Dorsets alone bear horns at present. How long ago the South Down became hornless, by sporting, environment, or breeding, nobody knows; but probably through atavism, it is not, even now, a very unusual thing to find a lamb with short horns among male South Down lambs.

The Hampshire Down originated about 80 years ago by a cross between the horned, white-faced sheep for ages native of the district, and pure-bred South Down rams. From time immemorial the South Downs had dark-brown or black faces and legs, and at the time of the cross Mr. Ellman, of Glynde, had, by 50 years of careful breeding, done as much for them, in the way of improvement in form, wool, and quality of mutton, as Mr. Bakewell, of Dishley, had done for the Leicesters. The original Hampshire was larger and coarser, but hardier than the South Down, slower to mature, and inferior in the quality of flesh; for even then the South Down had generally won the reputation which it enjoys more widely to-day—that of being the best mutton sheep in the world. Another characteristic in which it surpassed the Hampshire, as it surpasses all other English breeds to-day, was its prepotency—its power of transmitting its special characteristics to its offspring by any other breed—due either to its superior natural vigor or to wise breeding for many years in one line by those who originated it, or to a combination of both. Hence it soon impressed its own characteristics on its offspring by the Hampshire, and in a few generations entirely changed the characteristics of the breed. The horns disappeared, the face and legs became dark, the frame grew more and more compact, the bones smaller, the back broader and straighter, the barrel rounder, the legs shorter and the flesh of better quality; while the offspring retained the superior hardiness and greater size, as well as the massive head and Roman nose of the old-time Hampshire. There seems to be no doubt that the present Hampshire Down has also in it a dash of Cotswold, and consequently of Leicester blood, as the Improved Cotswold has a large admixture of Leicester.

The present Hampshire Down sheep mature early and fatten rapidly. The lambs are of large size, and are usually dropped early and fed for market lambs, or kept over till one year old, the following Spring, when, if properly treated meanwhile, they will weigh 80 or 100 pounds, and sell readily at a profitable figure. They clip from six to seven pounds of wool suitable for combing, longer than South Down wool, but not so fine. The mutton has a good proportion of fat and lean, and is juicy and fine-flavored. This breed has been used considerably for crossing on other breeds, and when crossed on Cotswolds the wool is more valuable for worsted than that of pure Cotswold. Its chief use here, however, would be to cross on native sheep to improve the progeny. Large numbers were formerly imported, especially for the South before the war, but of late years more fashionable and better "boomed" breeds have come across in greater numbers. It is still quite popular in England, however.

The specimen Hampshire Down ram shown at Fig. 272 is from the herd of James Wood, Mt. Kisco, N. Y.



HAMPSHIRE DOWN. Fig. 272.

Dairy Husbandry.

DAIRY NOTES.

BY T. D. CURTIS.

MILK FOR A POUND OF BUTTER.—Some one says "the quantity of milk necessary to make a pound of butter varies greatly, ranging from nine to fifteen quarts." He might have said, ranging from five to twenty-eight quarts—for counting a pint a pound (it is a little more) according to the old woman's rule, it takes from 10 to 56 pounds of milk for a pound of butter. Prof. Henry, of the Wisconsin University Farm, found it took the latter amount of milk from his Holland cow to make a pound of butter, and the milk of some of the Jerseys requires only nine or ten pounds. These, of course, are extremes. Some of the Holland cows give milk of which only 18 or 20 pounds are required to make a pound of butter. The herds of the country will average 23 to 25 pounds of milk for a pound of butter for the entire season. The general average is 20 to 25 pounds.

THE TROUBLE IN DAIRYING.—It is asserted by some one that "the great trouble in dairying is the multiplicity of theories and the flood of advice offered by shallow persons who are not practical dairymen." Such an assertion does not show a great deal of practical sense. No man with a head on his shoulders need be led astray by theories or blunders because of their number. My observation is that we have too many self-conceited and stupid dairymen, who always misunderstand and misapply what is taught them, if they pay any attention to it, and then blame the source of their information. Comparatively few people have imagination enough to comprehend and apply correctly oral or printed instructions. The few who have are the lights of the world, teaching the great mass by example. Most men have the imitative faculty.

EXTREME NICENESS.—I see it stated that a Massachusetts dairyman requires his milkers to wash and comb their hair before milking. This may be very nice, but all depends on what they work at before milking. It might demand washing and combing, and then fail in cleanliness if the milkers did not put on clean clothes. It is to be inferred that the cows are to be washed and combed.

THE AVERAGE HERD.—A Western exchange describes the average herd as follows:

"Two extra, five very good, five good, five poor milkers, one kicker, two jumpers, and one that milks so hard that it costs all that it is worth to get it; of the remaining four, one has lost a teat and three are too old. Look to it that this paragraph does not describe your dairy."

There is no question *but* that most of the herds of the country would be improved by a judicious weeding out—and now is a good time to do it.

THE BEST BREED.—I consider the search for the best breed of dairy stock to be about as sensible as the search for the philosopher's stone or the fountain of youth. All the published experiments that I have seen bearing on this subject, are partial and unsatisfactory, showing only the relative value of the individual animals experimented with. It is a very difficult, if not impossible thing to get any one animal of a breed, that can properly stand as its representative and determine its relative value—so much depends on conditions. The same animal will not always give the same results. To determine the relative value of breeds would require many experiments, not with individuals, but with properly selected and kept herds. I very much doubt if such an experiment would pay, if it were ever so carefully and thoroughly tried.

YES, IT CAN BE DONE.—I have often heard the question asked if we could not select foundation stock from our best so-called "natives" and develop a valuable breed. Yes, it could be done, but would it pay? Our "natives" were once imported, but have become mixed, mongrelized and degenerated by hard fare and lack of care in breeding. Such

foundation would be very unreliable—about like quicksand for the foundation of a building. It would take a long while to fix the type, even if we secured a good one, and get up to where we might begin by selecting thoroughbreds for a foundation. It is always best to start with the best. Even then, obstacles enough will arise.

SUGAR IN BUTTER.—I see it stated that "Prof. Stewart recommends salting butter with one-fourth of white pulverized sugar and three-fourths in weight of fine salt, one ounce of the mixture for every pound of butter." What Stewart we are left to guess. But I think there must be some mistake about this. Sugar is a very unstable compound, when in a diluted form, and very bad for both butter and cheese. It plays the mischief in the cheese-vat, if the maker is not careful to guard against it and get rid of it as soon as possible, and I have always considered it objectionable in butter. The more completely it is washed out, the better and the longer the butter will retain its flavor, which will be cleaner without the sugar than with it. To add sugar to it—and especially common pulverized sugar, with all its impurities—is to invite rapid loss of flavor and the development of a bad one. The sugar will surely decompose, if oxygen gets to it—and it is difficult to keep it away. It is much easier to keep the sugar out of the butter. Pure butter, free from all foreign ingredients, and flavored with pure salt, is the most palatable and will keep the longest. Don't doctor your butter with sugar, saltpeter or anything else. There is too much adulteration.

COSTS AND VALUES.—Prof. I. P. Roberts finds it costs him 1¼ cent per quart to produce milk on the Cornell University farm, and the value of the manure he estimates at 16¾ cents a day per cow. This was in an experiment to test the value of the manure by special feeding for the purpose. Only the manure of well-fed milch cows could be so valuable, and to secure or retain this value, the manure must be carefully housed. There ought to be profit in producing milk at 1½ cent per quart, even in these times of low prices.

BIG MILK RECORD.—Up to May 1 last, 25 of our heifers had closed their two-year-old records which commenced in the Spring of 1885. The weight of each milking of every animal was carefully and accurately kept, and testified to by the milkers in a manner satisfactory to the Superintendent of the Advanced Registry. The record of the entire lot averaged, for the year, 12,409 pounds eight ounces. This average so far surpasses all previous herd averages for heifers of the same age (two-years-old) that its publication will be of interest to all breeders.

SMITHS, POWELL & LAMB.

Syracuse, N. Y.

The Swineherd.

THE VOICE OF THE DUROC-JERSEYS.

I LIKE the article of Mr. R. J. Young, St. Joseph Co., Mo., published in the RURAL of June 5, for its general fairness and its entire brightness. Mr. Young has done well with a bad case. Lawyer-like, he made his premises to suit himself, and went away back into the legends of the past to get his specimens of red hogs on which to found his argument, and repeated the old, old squib of the corn-crib breeders, about "rail-splitters." I wonder what the Poland-China perfectionist would do if he could not call up this antiquated jibe when he towers in indignation at a little good advice about his line of breeding and feeding and the dangers attending it. People have been blind before and suffered woefully for it. None of us is too wise to learn, and the breeders of the Duroc-Jersey hogs have lived and learned and improved their hogs wonderfully; and I have heard it said that Poland-China breeders were afraid of them.

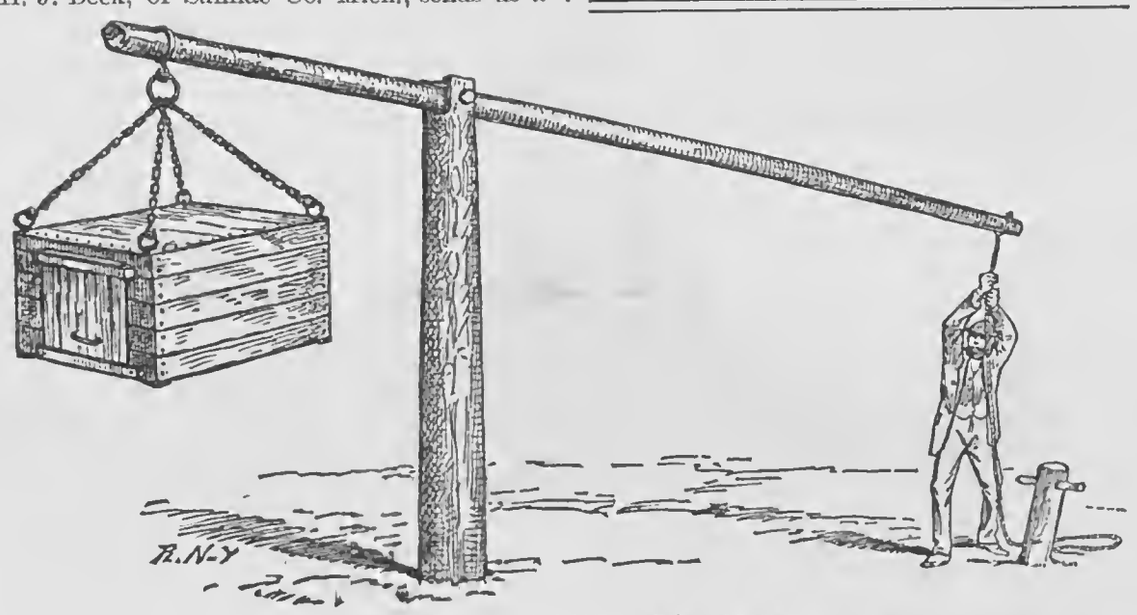
I will say again that I think the Poland-Chinas "are as nearly perfect as they can be." They have got all the Berkshire in them they can very well get, and the road is ended in that direction, and now I generously suggest to them to travel with us and try the Duroc-Jersey blood. When perfection is reached, or rather if "improvement" is reached which has been aimed at, which is called sometimes "early maturity," and means getting fat all the time, then comes a good time to change and put in some new blood before deterioration sets in too strongly. It doesn't seem to have dawned upon the average Poland-China breeder that when a thing is finished, it is done—when a thing is ripe the next step is decay. Breeds have run out in the past, and they may be running out in the present, and they will in the future.

Science has exploded a great many old traditions and notions, and science teaches me that a line of breeding founded on *corn and fat* will run out any breed of people, cattle or hogs, and cholera seems to confirm this view; for it revels in just these conditions. A number of Western men have told me that the Poland-China pigs are apt to be weak when they come, and I have no doubt of it. That Mr. Young, or his careful neighbor, had strong pigs and lots of them would not disprove this. They may be the exception. A great many shippers told me that the losses with Poland-Chinas, in shipment, were excessive; that they did not "stand up" well in shipment. I do not doubt this at all, and the fact that one could walk 15 miles in a day, though it weighed 700 pounds, won't upset the statement. This was another notable exception. No one can convince me that all corn and fat in fathers and mothers for generations will put strong bone and stamina in the offspring. I have not lost one pig this Spring from weakness or disease, and one sow had 11 pigs in an open field in the night during a cold rain storm. It is a common thing for Duroc-Jersey pigs to dress more than 300 pounds when eight to ten months old; but I am aware "that simple assestion will not give hogs stamina or lots of pigs;" but new and strong blood with plenty of muscle and bone and a variety of food will, and that is what we want.

F. D. CURTIS.

A HOG LIFTER.

IT is often necessary to carry hogs from place to place. A sow with a litter of pigs is the most uncomfortable thing imaginable to drive when she takes a notion to go in another direction. Large hogs can be driven from the pen, up a board, into a wagon, but little pigs are hard to manage in this way. When the whole brood are driven into a box it requires several men to load it into the wagon. Mr. H. J. Beck, of Sanilac Co. Mich., sends us a sketch of a contrivance that must add greatly to the ease of such a shipment. While visiting a neighbor he saw a sow and her pigs loaded into a wagon with so much ease that he made a note of it at once. A large box with a sliding door and rings at the corners—like that shown in the illustration—was placed on the ground. By means of a little feed, the sow and her pigs were induced to enter. Then the slide was dropped, leaving the pigs prisoners. Then the long pole shown in the picture was lowered so as to fasten the chains and hooks as shown. Then by pulling on the longer arm of the lever, the whole thing was lifted and fastened so as to hang high enough to enable a wagon to be backed under it. With an implement of this kind one man can lift a very heavy load.



A HOG LIFTER. Fig. 275.

The Poultry Yard.

BLACK RUSSIAN FOWLS.

MR. E. HALEY, of New London Co., Conn., sends us the following information regarding the Black Russians, shown at Fig. 278, p. 431: "This rather odd but beautiful breed of fowls is supposed to have been originally imported from Russia. They are a trifle odd, because they haven't a vestige of crest: they have full beards or whiskers, which give them a peculiar look. They are naturally very hardy, and being very fully feathered, they are well adapted to cold weather, hence they are great egg layers through the winter months, and also good summer layers. Their bones are rather small for their weight, for they have full, plump breasts and bodies. Though they have dark-colored legs, they have yellow fat and skin and are fine table fowls, their weight being from six to eight pounds. They are quiet and gentle and easy to manage. They feather and mature quite young, and pullets commence to lay when about five months old. They have all the good qualities that could be desired in a fowl, and are therefore one of the best breeds for the farmer. Their glossy, greenish-black plumage, bright red rose combs, heavy beard and stylish carriage make a flock an ornament to any yard or lawn."

REMEDY FOR ROUP.

I HAVE lately had several cases of roup among my poultry, and have cured every one discovered in time—bad attacks too—by simple remedies. First, give a bread pill containing Cayenne pepper and red horse-powder, and at night a teaspoonful of the best castor oil. Also wet the nostrils well with kerosene oil during the day—twice if the attack be severe—and let the birds breathe fumes of the flowers of sulphur. I take a pan of ashes, put live coals on it, then sprinkle sulphur on the fire and move the pan under the roosts in the evening when the fowls are on them. Care must be taken not to allow it to be too strong. I have used compounds made by long recipes, and have not found them nearly as effective as the above remedy. I would no more be without this than I would go without camphor and cough medicine or ointment in the house.

Durand, Ill. G. S.

DOES IT PAY TO KEEP POULTRY?

SOME deny it. I kept 27 hens the past Winter. From Dec. 21, 1885, to April 26, 1886, inclusive, they laid 1,272 eggs, or 106 dozen, which sold for from 18 cents down to 10 cents per dozen, and averaged 14 cents or more. At 14 cents, they netted $14.84. The birds were fed wheat screenings with corn and boiled vegetables occasionally. The entire feed did not cost $5. They were Plymouth Rocks, Black Javas and Brown Leghorns. Of the last we had five pullets. They began to lay when five months old (this is no guess-work), and between the above dates they laid 450 eggs. No doubt many can beat this, but it answers the above question.

C. S.

Plover, Wis.

ONE way of flanking our insect foes is to change our planting ground. Plants of squashes in an old garden were beset by an army of cucumber beetles as soon as their seed-leaves appeared above ground, while on a plat a few rods distant, on which no cucurbitæ had been grown for years, the plants were scarcely molested at all. Potato plants on soil devoted to potatoes three years were eaten back to the ground by the Colorado Beetle, while on ground that has seen no potatoes recently the foliage is scarcely injured.

I have received little if any benefit from the much lauded kerosene emulsion. Used for aphides in varying degrees of strength, it greased the foliage, but did not kill the lice. Used very strong for the cabbage maggot, it has not stopped, if it has checked the injury. An emulsion containing one-fourth in bulk pure kerosene did not kill the maggots immersed in it. Used for the codling moth, it injured the foliage, but did not decrease the wormy fruits. Who has a better record for it?

I find that transplanting may be accomplished with excellent success, even in very dry weather, if it is properly done. Make a hole with the dibber or trowel, and fill it with water. A few minutes afterward, set the plant, placing the roots deep, pack the earth tightly about the roots and stem, and cover the surface with mellow earth. Plants of cabbage, egg plant, tobacco and pepper set in this way, have scarcely withered, though no rain has fallen since, nor for many days before the setting.

Another season's careful experiments in fertilizing the blooms of the strawberry with pollens from different varieties give only negative or nonconmittal results. The drought pinched the fruits severely on removing the plants from the greenhouse to the garden, and they ripened prematurely; but the story told is a repetition of that of last season. Berries of Crescent fertilized with pollen from Lennig's White, were not perceptibly lighter in color than the same fertilized with Wilson pollen. Flowers fertilized on one side with pollen from Lennig's White, and on the other with that from Sharpless, gave berries colored all alike. Flowers not fertilized at all, unless from the pollen imperceptibly carried through the air from neighboring plants in the greenhouse, produced a few berries which bore apparently normal seeds, though the blooms bore no visible filaments or anthers. One effect of the cross-fertilizations, however, was visible. The percentage of berries secured in the crossings was clearly in proportion to the abundance of the pollen yielded by the flowers used. That is to say, the Lennig's White and Sharpless, which yielded more pollen than the Wilson, gave a larger proportion of berries than did the latter.

E. S. GOFF.

Geneva, N. Y.

Farm Topics.

THE DARK SIDE OF FARMING.—II.

HENRY STEWART.

THERE are a great many misfits in this world. A bright, witty woman once remarked of those married couples who sought disunion in the courts, that they were misfit couples, and surely this term may be applied to those farmers who have got into a business unsuited to their character and habits, and in which they chafe themselves, and live under the dark shadow of discontent. Contentment is a spring of happiness, and happiness in one's vocation is the secret of success. Riches and the means of extravagant living are not often possible to the farmer; a plain sufficiency, abundance even of all the necessaries and many of the comforts of life a farmer may have, but the empty superficial pleasures of society, the gossip, and the frivolous employment which some call "society," are scarcely consistent with farm life. When these are thought to be the sum of happiness, then one pines in what has been called the dreary isolation of farm life, and contentment vanishes, with all the brightness which it brings to the life. There is no dreariness or isolation when a farmer and his family "shut up in measureless content" find within their narrow environments all that is pleasing to an intelligent mind, in the contemplation of all the beauties and wonders of nature, in the pure air breathed, in the wholesome varied exercise of the field and garden, in the studies and pleasing discoveries which are made day by day, and in the "sweet restorer, balmy sleep" which is enjoyed nowhere else so fully as on a farm.

The man or the woman who is a misfit farmer or farmer's wife is to be pitied, not because farm life is not desirable, but because the disposition to enjoy it and make the most of it is wanting, and this casts a dark shade over the life, however one may be situated. Once I saw a cross child given a bright toy; it was one that opened with a spring and let loose a gayly dressed figure. The child in its petulence threw the toy from him with force enough to loosen the cover, and out burst the figure. Here was a revelation, a discovery of something which startled the mind and gave rise to pleasurable surprise. The child instantly changed from frowns to smiles; the tears were dried, and with a cry of joy, the cast-off toy was picked up and examined and its nature pried into and every discovery was a pleasure. Just so in a large way the misfit farmer may at some time, and generally does sooner or later, make the discovery that he is at fault, and that he has been casting from him in disgust many enjoyable opportunities and privileges which he could find nowhere else. He has been living in darkness because he has shut his eyes to the light. Sometimes this is true of the farm wife, and with her all the family are made miserable. The children then look forward with hope and anticipation to the time when they can flee from the farm house which has been dark and dreary to them, and by and by one by one they disappear, and the old couple alone, seek enjoyment in their own misery and pass their old age, like Bunyan's Giant, blind and helpless, but full of spite and rage, because every passer-by seemed happy and was beyond his reach. Such a life makes the boys leave the farm, and the girls are in haste to follow them. It is not the land or the oil; it is the men, who have been misfitted to it, or perhaps the women, who have made their labors doubly hard by their own discontent and fretting and have worn out their life in misery.

How can it be altered? It is not hard for a man's disposition to be changed. A word does it sometimes, a bright thought breaking in upon the mind; a reflection, as it were, from a mirror, which shows the man his fault; but it must come from without; it cannot spring from within. No man was ever converted from the error of his ways by a slow process of self-reasoning. But he has been brought up "all standing," as it is said, by a sudden thought or circumstance. Now, let this farmer who feels that he is living on the dark side of his occupation, begin to think of the purpose of every act and work of his; to study the principles of his work; ask himself why this is and how that is. When he sees the seed he has sown germinating and sending up its spire and down its radicle; or the trees and plants, only a few days ago dead and lifeless, now breaking out into leaf and bloom; or the insects which buzz and seem to enjoy themselves about him; or how all living things appear to live in the light and sunshine, let him ask how it is that all nature is so beautiful, so well ordered, so amenable to the strictest law and order, and so happy, if it is not that some most beneficent wisdom has made everything work together for man's happiness, and that if a man is not happy it is his own fault, and if he will only take the right way of doing it, he may clear away the clouds from his life and be as happy as a man can be, if he will only not be a misfit, but fit himself completely to his circumstances and work.

CORESPONDENTS' VIEWS.

I THINK the lime-dust treatment the best of all cures for gapes in chickens. It is cheap, simple and effective. I put a whole brood of chickens in a peck measure with a bag over the top. A barrel partly filled with air-slaked lime, as dry as powder, was turned on its side and the lime was stirred with a stick until the whole barrel was filled with lime floating in the air. The chickens were put in this, with the bag over the mouth of the barrel. They were put into the dust three times, not more than a minute each time. They should be kept in the measure all the time. We let one brood stay in too long and lost five out of seven. The wind-pipes of the dead chickens were found more than half filled with gape worms, which made it more difficult for them to breathe. My little son, seven years old, treats his chickens in this way successfully. The lime can be slaked with water and then allowed to dry so as to powder. A lot of lime thus prepared will last for years for this purpose. F. D. C.

Saratoga Co., N. Y.

I WANT to know what others think about rye as a green manure. With me it has not been a success by any means. I tried sowing it in alternate strips across a 40-acre field that was to be planted to corn. The previous crop was oats. When the rye was ready to head, the whole field was plowed and planted to corn, and all parts were treated just alike. The strips that had no rye on them yielded three bushels more per acre than the rye-ground. In this instance, then, the rye as a fertilizer proved a loss of one plowing, the seed and seeding, and three bushels of corn per acre. Besides this, the ground was in a worse condition — more grass and weeds. Early plowing, before the weed seeds were ripe, sowing among the corn or on fallow might have produced a different result. People say that a crop of rye contains so much plant food. I would like to know from farmers what soil, seasons, conditions and handling are necessary to make this plant food available. M. B.

Kankakee Co., Ill.

IT is very hot here now, and we have flies about us by the million. Screen doors and window frames are slowly coming into use, but most of the Southern people have not thought of keeping flies out of the house. They seem to prefer to let them come in and then to drive them out again with green boughs. Nothing amuses the Northern visitor more than the little negro who stands at the head of the table brushing the flies away from the food. He has a long green bough in his hand, which he skillfully flourishes about the table. In Richmond, many of the restaurants have fitted up large fans which are run by water power furnished by the city. These fans are of light wood, about three feet long, in the shape of a double wing. They make about eight revolutions per second, and create such a breeze that all flies are driven out, while the temperature of the room is greatly reduced. I believe it would pay well for the planters in this section to put up some of these fans in their houses. Where labor is as cheap as it is here, the motive power could be easily supplied. A crank could be fixed on the outside, and the boy who now brushes flies away from the table could turn it about as easily as he uses the bough. Such an arrangement would bring untold comfort to this hot climate. [Over a dozen years ago we saw such a contrivance in a planter's house near Victoria, Texas, driven by a cheap or home-made little wind-mill on the roof. There is generally wind enough in the hottest day to do such light work—and the breeze created is a blessing in the sweltering nights of the South.—EDS.] There are many little things about house-work that could be greatly aided by some sort of cheap motive power. Inventors seem to have given their great attention to the work of perfecting the stronger powers. If there could be made a portable boiler and power that could be fitted upon the common stove or range, and connected with light machinery about the house, a great deal of disagreeable house-work could be lightened. I FIND that many so-called temperance men raise barley and sell it to be made into beer. I can't see what business they have to find fault with a beer seller. They should either keep quiet on the temperance question or have their barley ground into cattle feed. It does not look right for a man to be continually cursing a business to which he owes his support. G. W. S.

Chester Co., Pa.

EVERY hog raiser, East or West, ought to have a field of clover. I don't see how hogs can be raised with any profit without it. There is nothing that suits hogs so well as a summer feed, and there is nothing that so cheaply and easily improves the soil. Hogs should be fed some grain while at pasture. I find that a hungry hog makes too good use of his legs. He becomes rangy and leggy. When he has plenty to eat and finds he does not have to roam about for his food, he will devote himself entirely to the business of laying on flesh in the most desirable parts of his body. This is, as I understand it, the proper business of a hog.

Montgomery Co., Va. J. M. E.

EVERY farmer should have a patch of raspberries. This fruit will give better satisfaction than any other. It will pay to transplant wild black raspberries where others cannot be obtained. I tried this 30 years ago with good success. I went through the distant fields and dug up some healthy briars. These I planted in September, in a rich sod ground on the west side of a stone wall. I left the briars from three to four feet in length and did not remove the buds. They were watered when first set out until rain came. They bore a good crop the next year, and for 15 years thereafter. It paid me well as I had my berries near at hand and did not have to tramp a long distance after them. Farmers, as a rule, have to depend upon the woods and fields for their fruit, from strawberries to apples. With a little work in the Fall, they could save much of the tramping after berries, by bringing the plants nearer home. Along old walls and fences, out of the reach of the cattle, the plants will find a climbing place so much like their old home in the woods that they will be content. I would say, buy the cultivated plants if you can, and give them good care, but at any rate save yourself time and tramping by bringing the wild plants nearer home. H. E. S.

Waterloo, N. Y.

I notice most of the papers are advocating the soaking of the rims and felloes of wagon wheels in hot oil. Now is this really a benefit or is it all experiment? I would like to have farmers give in their experience on this point. How does the oil affect the wood, and what is gained by the operation? H. G.

Orange Co., N. Y.

A BOX without any bottom in it, a foot square and eight inches deep, with a string stretched from one side to the other, with rags tied to the string and left to flutter in the wind, placed over the melon hill, I find to be protection against the meanest bug (yellow-striped) I ever had to contend with. A quarter of a teaspoonful of Paris-green in three gallons of water, sprinkled on the vines, will kill the bugs, and if the sun comes out hot just after the sprinkling, it will kill the vines also; but if it remains cloudy these will not be hurt. I do not recommend it: yet I used to employ it, but if I hadn't boxes, I would take the risk, it is such a pleasure to kill the bugs. If they are not destroyed or kept away, they will kill the vines. I have many inquiries regarding my hay furnace. Some few of the letters contain a stamp for answer. I wish the friends would remember that I am not a Congressman, and have no franking privilege.

THE RURAL'S WHEAT-AND-RYE HYBRIDS.

PROFESSOR W. TRELEASE.

ABOUT two months since the editor of the RURAL was kind enough to send me one of the original heads (sterile) of his seedlings obtained from Landreth (Armstrong) Wheat, castrated and pollenated with rye at the Rural Grounds in 1883. I have been interested in his experiments as reported at intervals in the RURAL, and in the opinions of the correspondents to whom specimens have been submitted; so that it was a pleasure to examine the specimen sent me, and to review what has been published concerning this cross. Having done this, I have thought that some of the RURAL readers might be interested in a statement of the botanical features of the parent plants and of these seedlings, as these have not been clearly brought out in any article that I have seen.

Mr. Bentham, who died not long since in England, is generally conceded to have been foremost among students of the Gramineæ, and his revision of the group for the Genera Plantarum is universally followed. In this work "Secale" (rye) is placed between "Agropyrum" (which includes our common Quack Grass, and "Triticum" (wheat). As Quack Grass has commonly been placed in the genus Triticum, it is self-evident that the relationship of wheat to rye is extremely close, so that there is no *a priori* reason why hybrids should not be obtained by proper manipulation; yet I don't know that this result has been claimed by others than the RURAL Editor.

The essential difference between Secale and Triticum lies in the structure of the spikelets (breasts) of the head. As in most grasses, each of these has at its base a pair of empty glumes (G in the cut, Fig. 276), forming part of the chaff; above these are the flowers, each with its flowering glume, and some more delicate inner scales that are of no particular int eres in this connection. The technical differences between the genera in question may be stated as follows:—

"Secale."—Empty glumes, narrowly linear, flattened, and keeled on the back. Spikelets two-flowered, the flowering glumes keeled; five-nerved, their nerves all running into a long awn or beard.

"Triticum."—Empty glumes broader, more rounded on the back, several-nerved. Spikelets two to five-flowered, the flowering glumes rounded on the back or keeled only toward the top; five to nine-nerved, only the middle nerve running into the awn when the glumes are bearded, the lateral ones shorter or prolonged into a pair of teeth on the sides of the awn.

These characters are shown at Fig. 276: A, a single spikelet of rye; C, a spikelet of wheat; and B, a spikelet of the RURAL specimen sent me: all enlarged one half.

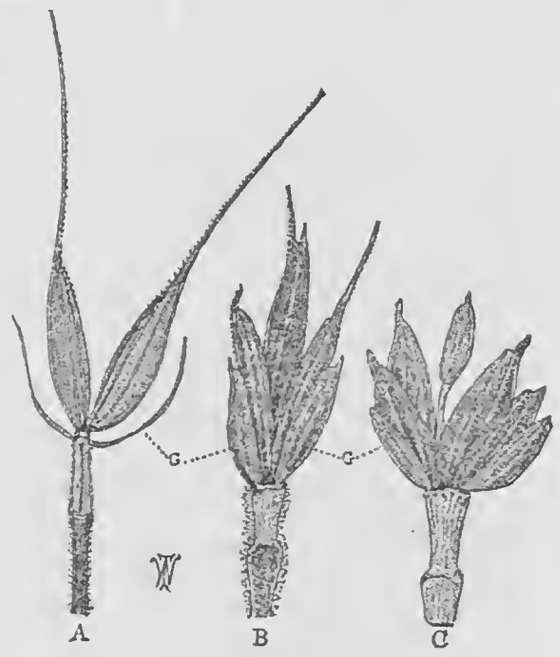

Fig. 276.

I think that a person picking up a single spikelet of this plant, or looking over the illustrations in the RURAL for Aug. 30, 1884, would pronounce it to be wheat. A glance at the illustrations given here shows that the specimen submitted to me has the generic characters of wheat in every respect and the foliage of these seedlings is said (RURAL, Aug. 30, 1884,) to have been colored like that of wheat.

So far as I can see, there are but two reasons for asserting that they represent hybrids; 1, the great variability of their offspring; 2, the fact that the culm is soft-hairy below the head, as in rye, while the rachis between the spikelets is similary hairy. It is well known that the offspring of fertile hybrids are prone to considerable variability, but this is also called out in some cases by simply cross-fertilizing different varieties of the same species. Granting, therefore, that the supposed hybrids may be the result of accidental crossing by the pollen of another variety of wheat—and the pollen of these wind-pollenated plants is so easily blown about and so insidious that this is no reflection on the care of the experimenter—this variability might be so explained. Just such a result from intentional crossing is reported in the RURAL for Oct. 31, 1885, p. 724. The hairiness of the stem below the head of flowers is the only real evidence of hybridizing that I find, and this is not usually regarded as a generic character, but only as one peculiar to the species of rye. However, it is sufficiently pronounced to satisfy me, in the absence of evidence that it is also found on certain varieties of wheat, that the RURAL experiments have resulted in a partially fertile hybrid, that is wheat to all intents and purposes, but with the one evident character of rye that I have named, and, possibly, additional hardiness or other obscure characters.

Since writing the foregoing lines, I have been favored with a fine suite of specimens (39 in number) representing the principal forms that the offspring of the RURAL hybrids present this year. As has been said of them before, these are extremely unlike, and the privilege of examining them has been eagerly accepted. After going over them all carefully, however, I find no additional evidence of hybridization. About half of the specimens have the culm hairless below the head. I doubt if a botanist not familiar with their history would suspect these being anything but wheat. But it is interesting to observe that in these, notwithstanding their great variability, there is no indication of rough hairy spikelets such as are characteristic of some varieties of wheat; so that this variability is within the type limits—widely understood—of the mother plant. The others present the same evidence of hybridity as the original specimen, viz., a downy culm.

St. Louis, Mo.

[In the collection sent to Dr. Trelease we were unable to add specimens, of the three-quarters rye plants from last year's cross. These will be illustrated later.—EDS.]

BLACK RUSSIAN FOWLS. Fig. 278.

Farm Economy.

PLOWING THE EXPERIMENT PLOTS AT HOUGHTON FARM.

REMARKS BY MR. EMERY.

In all experiment work, it is essential so keep all the conditions possible under control, except the one which is the subject of investigation. This has long been well understood by experimenters, and entered into the plan in the regular work to be done at Houghton Farm. On all plots of ground which are to be differently fertilized, every possible condition except that of fertilization is made identical. To this end, the work on the plots in the field is carried on in such a way that an equal amount is done on all plots at the same time by the same men and teams to insure like preparation of the ground and handling throughout. For instance, in plowing the plots in the Spring, the furrows run crosswise of the plots, and teams are employed to plow all of one series of plots in one day, and each team is started so as to do equal amounts of work on each plot, thus equalizing any difference there may be in quality of work done; they are harrowed the same day; the seed all planted on one day; and the hoeing and cultivation are done the same way as the plowing. When harvest time comes, the crops are harvested in the same way, and all products carried over the scales at that time. This gives us the final result as accurately as we can attain, with all conditions possible to control, except the one under trial, the same for each and every plot. The original condition of the plots, as has been stated in a publication of the Farm, was very uniform, whatever exception there was being there stated in full.

A few paragraphs from our H. F. experiments with Indian corn, under the head, "Distribution of Labor," are as follows:—"In all experiments with field crops, a uniform distribution of the work of preparing the soil, of cultivating the crop during its period of active growth, and of harvesting, not only as to the amount of effective labor upon each plot, but also as to the time of performance, is a matter of great importance.

The same amount of labor on adjacent plots, if performed at different times, even if but a single night intervenes, may give quite different results if but a moderate shower or other climatic change occurs in the interval; and variations in the crop, from differences in performing particular operations, have been observed without any other apparent cause. From the hygrometric properties of both the ears and stalks of Indian corn, a difference of a single day in the time of harvesting and weighing may make important differences in the apparent yield.

Without further details in the way of illustration, it is safe to say that too much care cannot be exercised in securing uniformity in all operations performed on the plots under experiment, and that lack of attention to what may be deemed trivial or unimportant details, may not only diminish the value of experiments, but render their results worthless. To save repetition, under the different heads of this report, a general outline of the system adopted in conducting the experiments to secure uniform conditions will be given here. The plowing and preparation of the soil are always done in the same direction, crosswise of the plots, so that each receives the same treatment.

In plowing, three teams were employed, so that the work for each series of plots could be done without hurry in one day, but they were changed in rotation from land to land so that each team did the same amount of work on each half plot. From this arrangement, if there were any difference in the holding of the plows, or in their performance, or in the speed of the teams, each plot would receive its fair share of the labor performed.

In planting, cultivating, hand-hoeing and harvesting, the same method of crossing the plots in each operation was practiced."

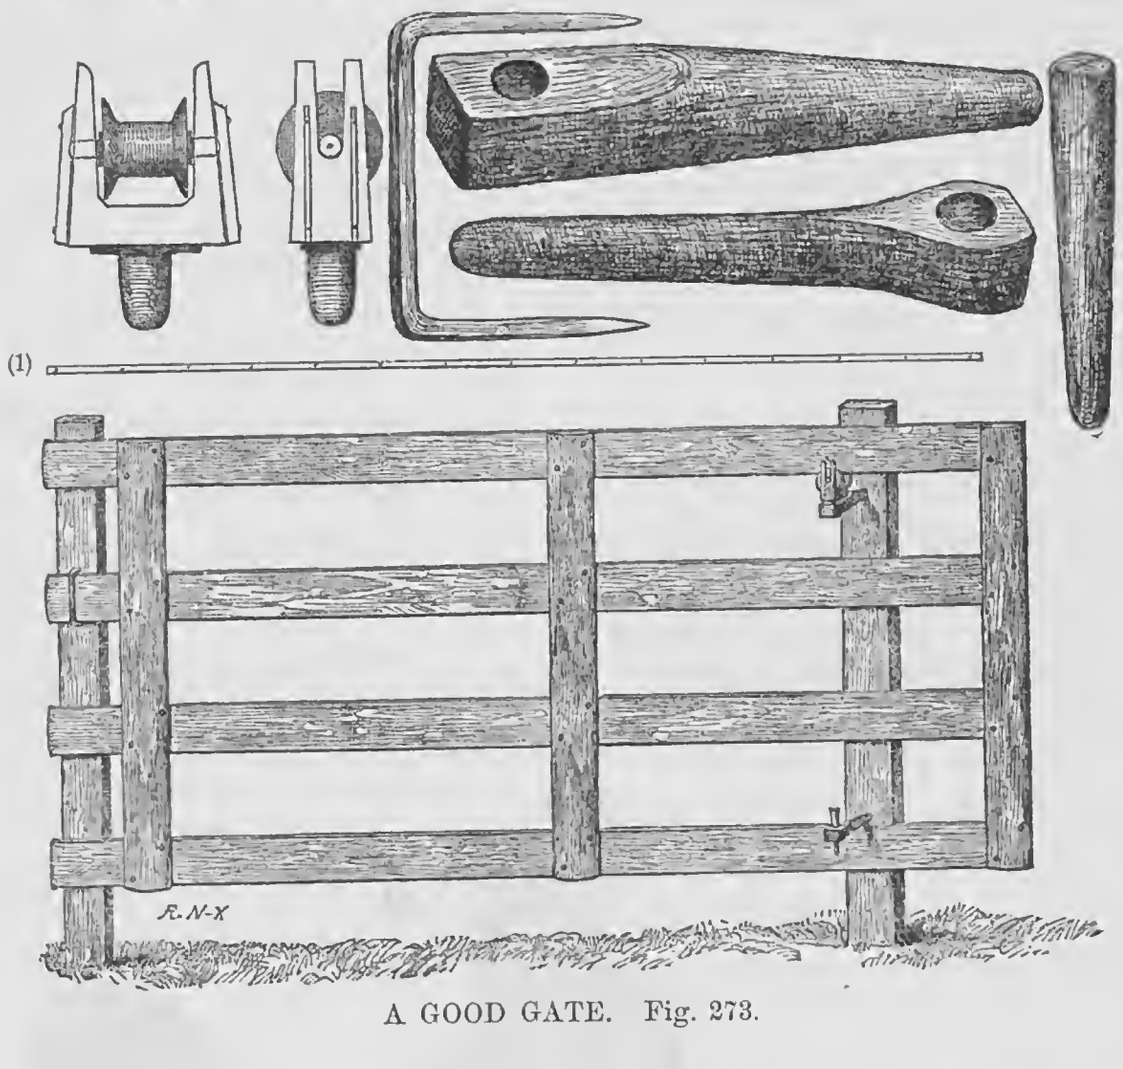
A paragraph from the same pamphlet, under Field Experiments, says:—"From the very nature of the complex conditions involved in all experiments in the feeding of animals and with growing crops in the field, the importance of the greatest care in conducting them, and a thorough verification of results by frequent repetition on a well-devised plan, to check the disturbing influence of the many conditions that are not under the control of the experimenter, cannot be too strongly urged."

A GOOD GATE.

The gate shown at Fig. 273, is the property of Mr. Bradford Bruce of Niagara Co., N. Y. He calls it the best gate in the world. How many of our readers are ready to agree with him? The drawing fully shows the way in which it is constructed. One can see at a glance how it is supposed to work. The iron work can be bought and the farmer can easily make the wood-work himself. The wheel pins and iron stay or clasp are shown at the top enlarged, while on the gate itself they are in place. An iron strap, marked 1, is nailed on the under side of the top board so that it runs over the wheel. The gate runs to the center board and then swings open. The lower shank with wooden pin prevents stock from lifting it. In winter this pin can be put one board higher, so that the gate will swing over any ordinary snow-bank.

STORING HAY.

G. Pelton & Sons, of Sauk Co. Wis., send us a description of their method of unloading hay. This is illustrated at Fig. 274. In the instance given the hay is stored in a barrack,

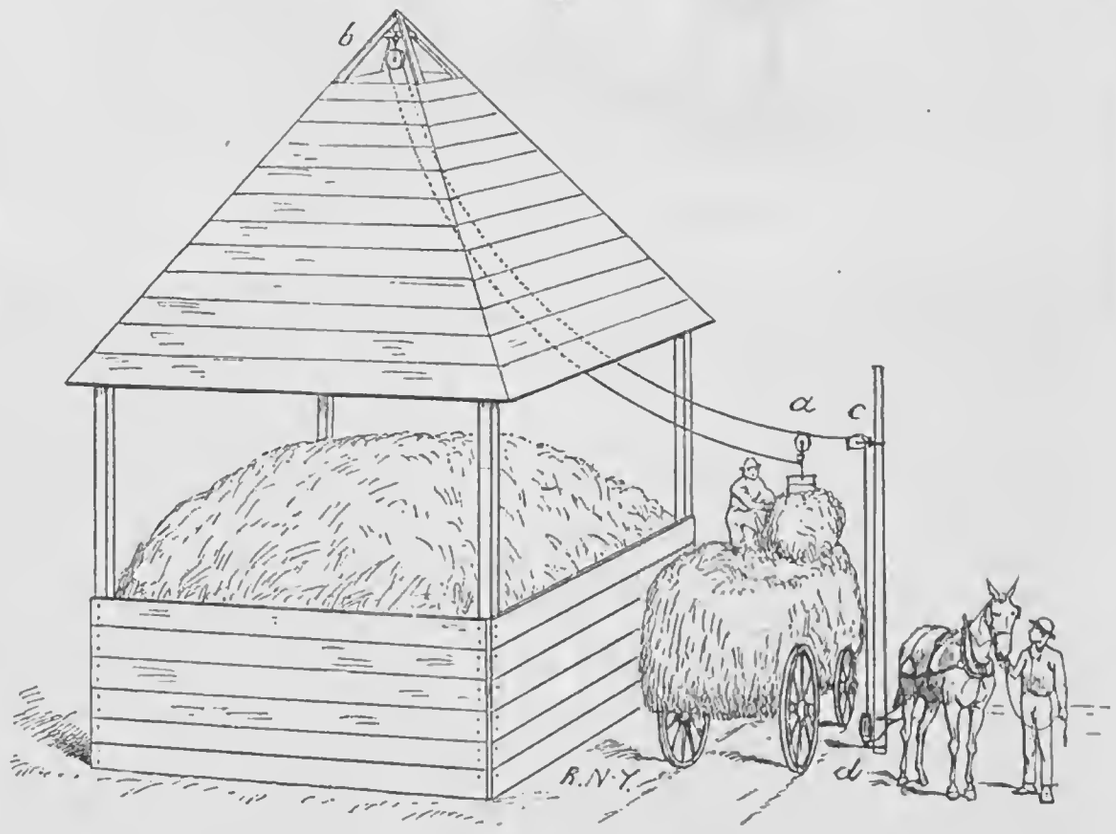


A GOOD GATE. Fig. 273.

but the same principle can be employed in unloading hay into almost any building. A rope 90 feet long, is fastened to the hay fork and slipped through the iron pulley, *a*. It is then passed up through the pulley, *b*, which is fastened at the peak of the roof. Then it passes down though *a* to *c* and *d* where it is attached to the horse. A strong post holds the pulleys at *c* and *d*. This system is simple, easily rigged, will save much lifting and expense for hay carriers.

FRUIT LADDER.

Mr. D. J. Bowling, of Harrison Co., Ind.,



STORING HAY. Fig. 274.

finds the fruit ladder shown at Fig. 277 a very handy implement. He used it in gathering

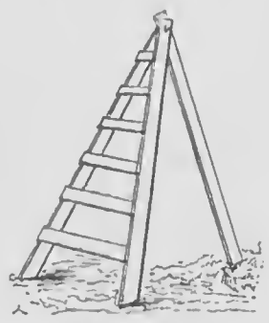


Fig. 277.

plums, cherries, etc. Two side-bars, each 7½ feet long, and one brace eight feet long, are all joined at the top with a 3½-inch bolt of five-eighths-inch round iron. The side-bars spread three feet at the bottom, and the cross-bars or steps are nailed 14 inches apart. The whole thing is made of 1x4 inch lumber. The ladder can be carried from tree to tree; it will stand on uneven ground, and there is no danger of injuring the limbs or twigs of trees in placing it.

Horticultural.

EXPERIENCE WITH SMALL FRUITS.

In the Rural's remarks on strawberries the Parker Earle has been mentioned. It has fruited this year with me, and I shall stick to it, for some time at least. The fruit is large, and, when fully ripe, of a light-red color, retaining for a long time a firmness not often seen in so large a berry. It is productive, "perfect"-flowered, and a plant of this variety could be selected from among a thousand other sorts on account of its variagated or yellowish blotched foliage: but I find no fault on that score, as it is one of the rankest of growers, thrifty and upright.

On the Rural's repeated recommendation I purchased, last Winter, four dozen plants of Jewell, put them in the hot-bed, gave them extra good care, put down every sucker, and now I have over 700 plants. Some of the old ones fruited, and were fertilized from Sharpless and Prince. They were extremely productive of fine, large, well formed berries, had a sprightly, sub-acid flavor, and I think they have come to stay.

I wish I could talk loud enough to make every raspberry grower in Uncle Sam's domain hear me call "Marlboro." My "patch" of them is a sight to see. Although only put out last Spring, they are loaded down with large fruit of extra-good size, fine flavor, and in my opinion far better than Hansell or Turner, and equally early. Entirely hardy on my not very rich ground. [A single year's trial of any new fruit will often lead us astray. —Eds.]

Early Harvest and Wilson Jr. blackberry plants are not hardy with me—at least they were not last Winter; 20 degrees below zero killed them to the ground. Strong shoots are coming up now, and if they do not winter through 1886–7 I shall apply the spade at the the root. [Early Harvest is not hardy at the R. G., and we fear Wilson Jr. is not.—Eds.] Taylor and Snyder are the iron-clads for our Buckeye Winters, and for productive qualities I can see no reason why they should ever take second place. E. M. G.

Dayton, O.

PRES. LYON'S STRAWBERRY NOTES.

The first strawberries this season were Alpha, on June 1st. This has now, for several years, shown itself to be the earliest really valuable strawberry with me. Early Canada may sometimes be a day earlier; but Alpha is larger, more productive and of finer flavor; while the hardiness and vigor of the plant of the latter are all that need be desired. Metcalf and Crystal City may, perchance, be a day or even two earlier; but their lack of size, and extreme unproductiveness have ruled them out, and I abandoned them several years since.

Alpha, Maggie, Bright Ida and Arnold's Pride, which ripen successively in the order named, are all seedlings (in the second generation) of the late Charles Arnold of Ontario, from a cross of Wilson upon the foreign variety, Dr. Nicaise; and are again, this season, as for several years past, surprising me with their fine size, fair quality and great productiveness. Jewell, Parry and Cornelia are fruiting heavily; but I doubt if either of these—even the Jewell—can be said to excel the former in vigor or productiveness.

Howell, a new variety of the history of which I am ignorant, ripened along with Crescent, on the second day after Alpha, and were soon followed by Philadelphia, Nicanor, Duchess, Duncan, Maggie, Bidwell and many others about in the above order.

The Alpha, last season, ripened its first fruit on June 13th; or about two weeks later than this year. Parry showed its first ripe fruit this season on June 11th. The plant shows a moderate degree of vigor; and is more than maintaining its last season's reputation for productiveness, as well as for the size, beauty and high quality of the fruit.

South Haven, Mich. T. T. LYON.

What Others Say.

Ripening and Preserving of Fruits.—At a late meeting of the Massachusetts Horticultural Society, Hon. Marshall P. Wilder read a very valuable paper on the "Ripening and Preservation of Fruits." The preservation of apples through the winter months is now pretty well understood, but with the pear, grape, and other delicate fruits more care is requisite.

The ripening of fruit depends on saccharine fermentation; this is followed by the vinous and acetous fermentations. To prevent these, and preserve fruit in all its beauty, freshness, and flavor, the temperature must be uniform, and kept below the degree at which the fermentation or ripening process commences. Mr. Robert Manning, in a prize essay, said, "The ripening of fruit is the completion of the chemical process by which starch is transformed into sugar, and is the first step toward fermentation, or decay; therefore, whatever retards fermentation will tend to its preservation."

Late fruits may remain on the trees until severe frosts are feared, but should be gathered with great care. Summer pears should be picked some days before the ripening process commences. A summer pear ripened upon the tree is generally inferior. In respect to the latter Mr. Patrick Barry says: "The process of ripening on the tree, which is the natural one, seems to act upon the fruit for the benefit of the seed, as it tends to the formation of woody fibre and farina. When the fruit is removed from the tree at the commencement of ripening, and placed in a still atmosphere, the natural process seems to be counteracted, and sugar and juice are elaborated instead of fiber and farina." Thus pears which become mealy and rot at the core if left on the tree to ripen, are juicy, melting and delicious when ripened in the house.

With the increase of fruits their preservation in the most perfect condition has become a matter of great importance.

About 20 years ago several patents were secured for the preservation and long keeping

of fruits and other commodities by Messrs. Shaler, Nyce and Smith. Professor Nyce of Ohio had one of his houses built in Boston, to be controlled by ice, and many constructed upon his plan are still in use in our large cities and large towns for the preservation of meats as well as fruits.

Mr. Hellings, in 1868, used a house for the preservation of fruit, which proved very successful. This was regulated by ice; he used no chemicals or machinery—the temperature was kept at from 34° to 36°—the atmosphere was so cool and dry that no moisture was deposited on the walls, and there was no dripping from the ceiling. The most constant care was also given to ventilation, and the light was entirely excluded to prevent ripening and shriveling. With these arrangements so perfected, no gases or mixture of gases with atmospheric air were ever generated. In these houses he kept apples two or three years in perfect condition. His houses are still in succesful operation at Bristol, Pa.

But the most common method for small establishments and private use is the construction of houses with walls of non-conducting materials and with well drained and thoroughly cemented cellars. Such was the house built by M. Victor Paquet, of Paris, about 40 years ago. It was built with outer and inner walls, with a space of three feet between; in fact, a house within a house, and so arranged that he could control the temperature at will, and which he kept at a little below 40° Fahrenheit. Our climate differs so much from that of Paris that we cannot follow all of M. Paquet's plans. Suffice it to say that by this process, without the use of ice, he kept his fruits in perfect condition until June.

On this plan, fruit houses may be constructed at a very moderate expense, in which fruits may be kept in all their beauty, freshness and flavor through the entire season. The Anjou Pear has been exhibited as late as the month of May by the late Gardner Brewer, from his retarding house.

Mr. Charles F. Curtis, one of the fruit merchants of Boston, informs Mr. Wilder that there is no perceptible difference between a cold storage house controlled by chemicals and one where ice is used. Each has its advocates.

One great secret of success begins in the state in which the fruit goes to the cooler. It should be before any specimen begins to show ripeness, and no single fruit should be stored that has fallen to the ground; for, however perfect it may seem, sooner or later that dropped fruit will tell its own story, and often cause the decay of the whole package when not noticed in time, which rarely happens when hundreds of bushels are piled one above another for a month or two. The fruits intended for cold storage houses should go directly from the orchard.

The fruit house of Ellwanger & Barry, at Rochester, N. Y., is a building where walls and floor are lined with straw and boards, with cellars underneath for storing fruit. When the mercury goes 10° or 12° below zero, a few 3° or 4° of frost get in, but the boxes and barrels are all covered with straw mats, and are never reached by the frost.

When the late fall and winter pears are gathered they are put in bushel or half-bushel boxes, and placed on the north side of a building outside of the fruit house, and protected. They are kept there as long as the weather will permit—by that time the room has got thoroughly cooled and ready to receive the fruit. They had both pears and apples there in perfection April 10th.

In the report of the Michigan Horticultural Society for 1882 is an account, by Mr. S. W. Dorr, of a fruit house constructed by him, on the cold-air system, without the use of ice. He lays down the principle that in order to keep fruit for any great length of time the store-room must be frost-proof and kept at a low, even temperature—three or four degrees above freezing, with sufficient ventilation to carry off all moisture and impurities. He was able to keep his house within three degrees of freezing for five months, and when the temperature outside changed 60 degrees in 24 hours, the change in the fruit room was imperceptible. Again, when the thermometer fell to from six to 20 degrees below zero, for five days in succession, the temperature scarcely changed one degree in the fruit house. This result was effected by building a house with triple walls, 15 inches in thickness, 10 inches of which were filled with sawdust.

The conditions of success may be briefly stated as follows: *The perfect control of light and moisture.* All experience shows that these conditions must be complied with or success cannot be attained; hence these apartments must be cool, and constructed so as to exclude at pleasure the external atmosphere, which starts fermentation. After many years of experience, both with and without ice, Mr. Wilder adopted a house built in a cool, shady aspect, with the door on the north, and with a thoroughly drained and cemented cellar, with small, double windows, which may be opened or closed at pleasure. In this way he is enabled to keep his late fall and winter pears until February or March in good condition. Apples may be kept at a lower temperature than pears—say 30 to 40 degrees.

In a fruit room of this kind, Mr. John J. Thomas says that by admitting air on cold nights, and closing the entrances when the air is warm, he has had sound Lawrence pears in March, and Josephine of Malines in April, and Baldwin apples in June.

Mr. Wilder's fall and winter fruits, intended for long keeping, are allowed to remain on the trees until frost is apprehended. They are then gathered with great care into bushel baskets, and placed on the north side of his fruit house in tiers of boxes six or seven feet high, and covered with boards, where they are kept until the ground begins to freeze. They are then removed to the cellar, piled up in the same manner, with thin strips of boards or shingles between the boxes, until wanted for use, when the boxes are looked over and the most mature are from time to time taken out. In this way he keeps pears until March or April in perfect condition.

In regard to the use of ice, Mr. Wilder said that where fruits are kept for some months under its influence at a low temperature, they seem to lose much of their flavor; the cellular tissue also seems to have become dry, and to have lost its vitality or power to resume the ripening process. Experience proves that, for the common varieties of the pear, about 40 degrees of Fahrenheit is the temperature best suited to hold this process in equilibrium. The proper maturing of fruit thus preserved demands skill and science. Different varieties require different degrees of moisture and heat, according to the firmness of the skin and the texture of the flesh. Thus, some varieties of the pear will ripen at a low temperature and in a comparatively dry atmosphere, while others are improved by a warm and humid air. Some varieties of the pear ripening with difficulty, and formerly esteemed only second-rate, are now pronounced of excellent quality because the art of maturing them is better understood. Great improvement has been made in the handling, packing and preservation of fruits, so that they are delivered in perfect condition from distant places, every class of fruit having its suitable style of package. So well is the art of keeping grapes now understood that we have them in our markets in such fine order as to command from 15 to 20 cents per pound until the month of May.

Robert Manning thought that the most critical time in regard to keeping fruit is the warm days in Autumn—the lovely Indian-summer days of October. Especial care is then needed to keep them cool.

Mr. Wilder said, in answer to an inquiry, that everything depends on the condition of fruit when it is placed in the storehouse. His superintendent watches the picking of his fruit with the greatest care: every fruit is handled as carefully as are eggs. Fruit placed in the storehouse bruised and in uneven condition as to ripeness will never keep.

Benjamin G. Smith, said that shippers begin gathering apples two or three weeks before it is generally done.

E. W. Wood agreed with Mr. Manning that the warm autumn weather is a critical time in the keeping of fruit. He generally picks his Anjou pears about the 10th of October, and last year they ripened about the end of that month, and he had to send them to market. Every year apples are found under leaves perfectly sound in the Spring. He thought those who store apples like to have the temperature as low as 30° and from that to 28°. Every year they get caught and frozen, but this is not considered an injury if the fruit is not wanted for immediate use. His father had stored apples in the cellar and found them frozen, but he allowed them to thaw without moving and they came out in perfect condition. They must not be shaken while frozen. He thought that houses where ice is used are not apt to be damp from the waste of the ice. In the cold storage house on North Street, Boston, which is five stories high and 150 feet deep, with an engine in the attic, and kept cool by the use of chemicals, it is so dry that matches laid anywhere will light with perfect ease, and he was under the impression that fruit comes out of such a house with better flavor than from an ice house. Cold storage is a great convenience to fruit growers; Bartlett or other pears can be stored when there is a surplus, and put on the market as it will bear them. The Vicar is the only kind that was carried through to the first of February this year.

Mr. Flint said that he once kept nine or ten barrels of apples on the trees till the 9th of November, when his neighbors thought they were spoiled, but he piled them up on the north side of a building until Christmas, and then put them in the stable and covered them with straw, and they kept finely.

Mr. Wood said that he once picked some Roxbury Russet apples very carefully and laid them on the ground until they were covered with a foot of snow; they were afterwards packed in barrels in coal ashes and opened the middle of June, when they were nearly perfect—plump, with the flesh crisp and juicy, and of fine flavor when others had lost their flavor. The air was excluded from them and the temperature was even.

VALUE OF WOOD ASHES.—Dr. R. C. Kedzie, of Michigan, issues a valuable bulletin on the value of ashes as a manure. Many of the analyses of ashes heretofore given have been almost too scientific to be of practical value. All foreign substances were carefully excluded from the specimens examined. As found on the farm, ashes always contain more or less sand or earthy materials. It is interesting for scientists to note the difference in composition of the ash of the body wood as compared with that of the branches of the same tree: but when body, limbs, bark and all are reduced in the stove or furnace, with the addition of much dirt, these nice calculations are apt to fail.

When we consider how large an amount of vegetable matter is represented by a small amount of ash, the value of wood ashes for manure becomes evident. Thus only 10 pounds of ash remain from the combustion of a cord of hard wood, and only five pounds from a cord of soft wood. One hundred pounds of ash represent the mineral matter of 85 bushels of wheat, 85 bushels of corn, or a ton of timothy hay. Eleven tons of gooseberries, grapes, blackberries, peaches or apples would contain only 100 pounds of ash. Seven tons of cherries, plums or raspberries contain only 100 pounds of mineral matter. But small as is the amount of ash, it is still indispensable for the production of these crops, and must be present in the soil in available form before profitable cultivation is possible. Let it not be supposed that the ash in all these crops is identical in composition. The ash of each class of plants has a composition peculiar to itself, and different in some respects from that of other classes; yet there is a certain similarity in the ash of all cultivated plants. When the ashes of vegetable substances are served up for any plant by mixing them with the soil, such plant does not of necessity order every dish of the bill-of-fare, but selects such materials and in such quantites as are adapted to its wants, and leaves the balance for some future meal or some other guest. If any soil is naturally deficient in any of the ash constituents, or has been impoverished by excessive cropping, the restoration of these materials in the form of wood ashes appears to be the natural and safe process because they contain all the minerals of vegetable growth.

Discarding ashes of mineral coal as valueless for manure, the ashes of wood and of land plants of every kind are of value for manure on every kind of soil which has been reduced by cropping: but the greatest benefit is shown upon sandy and porous soils. On these "light soils" crops of every kind, but especially root crops and corn, will be benefited by a dressing of wood ashes. Fruit trees and fruit-bearing plants having a woody structure, will be benefited by wood ashes. Thirty or fifty bushels to the acre of fresh ashes will be a full dressing, and three or four times that amount of leached ashes may be applied with permanent benefit.

Dr. Kedzie gives the values of ashes as they are ordinarily found upon the farm, as follows:

Hard wood ashes per ton				$20.00
Leached	"	"	"	10.40
Soft wood	"	"	"	16.00
Corn-cob	"	"	"	50.00
Tannery	"	"	"	4.50
Soft coal	"	"	"	.40
Hard coal	"	"	"	.16

MILK FEVER.—A writer in the London Agricultural Gazette states he treated a cow suffering from this dread disease. On Thursday night the cow calved, and all went well until Saturday evening at six o'clock, when the premonitory symptoms appeared. He at once set to work as directed in Moore's Veterinary Homœopathy, and administered a dose of aconitum, 10 drops in a wine-glass of water; three hours after a similar dose of belladonna was given, and three hours later another dose of aconitum. At this time, half-past twelve o'clock, the pain began to subside. She then had, four hours later, a dose of nux vomica, 10 drops in water as before, and during Sunday at regular intervals she had three more doses of nux vomica, and a last one on Monday morning. All Sunday she remained in a sleepy, helpless condition, but quite free from pain. On Monday morning she got up and had a small bran mash; in the evening she took her food eagerly, and on Tuesday was quite well. Her flow of milk stopped only during the hours of great pain. After reading of such "cures" the query involuntarily arises, "What would have happened had no medicine been administered?"

ROOTS IN THE MILK RATION.—Prof. L. B. Arnold, in the N. Y. Tribune, says that carrots make better-flavored milk and butter, and rather more of them, than mangels when equal weights are fed. Mangels are notorious for making thin and low-flavored, but not unwholesome, milk, like that from brewers' grains. They have a food value, as compared with carrots, as seven to nine, but mangels are raised with less labor, and will produce about 50 per cent more weight to the acre than carrots, about 600 bushels of carrots and 900 of mangels being the usual crop for an acre of good ground, if good care be taken of them. As measured by analysis, 5¼ pounds of carrots, or seven pounds of mangels, would have a value equivalent to one pound of oats. Owing to the quicker and more complete digestion and greater efficiency of green food than dry, something less than the weights above named, perhaps a pound less of each, would be as valuable as a pound of oats. As a quart of oats weighs a pound, about 18 pounds of carrots or 24 pounds of mangels would be a fair exchange for four quarts of oats. In substituting roots for oats, it should be remembered that they differ so much in composition that one cannot fill the place of the other. Oats alone make an excellent milk-producing food, being well balanced as to flesh-forming and heat-producing matters, while roots are much lacking in flesh-forming material. Something that will make more flesh than roots should be fed with them. Wheat bran and middlings would help them very much, or an equal weight of early-cut clover hay, or one-eighth of their weight of linseed, cottonseed or pea meal. When *fresh* (not fermented) brewers' grains are fed with roots in equal weights, each serves to correct the defects of the other, and the two make a much better milk than either would alone.

BREEDING HEIFERS.—In deciding the age at which heifers should be put to the bull, the American Dairyman says that it is well to remember that no two heifers are exactly alike, and rarely will the same set of rules apply equally and justly to both. Some are nearly double the size of others at the same age, while it often happens that the large ones are not so well matured as many that are smaller. A large, weedy, long-legged heifer may be injured permanently if made to produce a calf before she is two years old, while another and much smaller, but more closely-knit heifer will support the maternal duties with perfect ease at 18 months of age. So it is with breeds. The small breeds, such as Jerseys and Ayrshires, may be safely bred much sooner than heifers of the larger breeds, such as Holsteins and all the beef breeds. The point is to do this thing with some respect to surrounding circumstances and have no cast-iron rules about it, such as breeding all the females at 15 months of age or at any stated age, but take them when properly matured and ready to bear the burdens that may be put upon them.

TRUE INWARDNESS.

WHAT an advantage it would be to farmers, says the Analyst, if townspeople could be induced to take more milk and less tea, coffee or beer; and what an advantage to the townspeople also. Few people will be inclined to argue that any one of the three beverages named contains a tithe of the nourishment that milk does. Why, then, in the face of this admission, is good, wholesome milk sold at a quarter of the price that any of the others are?.....

WHY don't people drink milk? Why, because they are in part ignorant of its value and in part afraid of it. The ignorance is inexcusable; the fear is equally so. Numerous outbreaks of fever have without doubt been traced to contaminated milk, and in some cases so clearly as to leave no doubt that milk is capable, when contaminated, of conveying such diseases. Some few deaths have been caused thereby, and consequently many people have given up the use of milk as a beverage. But how many has John Barleycorn slain? His victims may be counted by thousands annually. And the abuse of the social cup of tea has ruined many a constitution. But well known though these facts are, they have not led, as might have been expected, to an increased use of milk, because, as has been already stated, so many view it with suspicion.

PROF. E. W. STEWART says, in the Country Gentlemen, that there is not much difficulty in teaching calves to take skim-milk. He would moisten ground feed with a little sweet skim-milk. The calves will eat the ground feed after mincing a little, and get the taste of the milk. Next time make it a little more moist with milk. Proceed in this way for a

few times, and they will learn to take the feed with a good deal of milk. He has never known this plan to fail. He has taught colts and horses in thin flesh to take skim-milk in this way, and found the milk very effective in restoring condition. It would be better that the milk should be warmed.....

THE Iowa Homestead says you can't steal from your land or from your calf without being caught in the act. Uneven crops and thin ribs will not be driven out of sight.....

WILLIS P. HAZZARD names the Guernsey as the best "general-purpose" cow. She has the butter qualities of the Jersey with a tougher constitution, larger size and better feeding qualities. She is the happy medium between the butter Jersey and the huge Holstein, with the good qualities of both and the defects of neither.....

Too many farmers still consider skim-milk simply a waste. Mr. R. H. Gage, of Wisconsin, thinks otherwise. He bought 10 calves, grade Short-horns, from one to three days old, and put them on to a skim-milk diet with a little oil meal and hay as soon as they desired it. In six months these calves weighed 3,500 pounds. Figuring hay and oil meal at regular prices, the skim-milk brought in $101.85. That is, it enabled the farmer to turn a certain amount of his work into that much cash. That sum is four per cent. on $2,500.....

A HALF-STARVED CALF, says the Am. Dairyman, is in just the condition to invite all kinds of diseases, and especially those chronic lung complaints that occasionally do so much damage in herds of dairy cattle. Remember it—you who seem to grudge every quart of milk that goes down the calf's throat.....

PROF. OLIN says, in the Industrialist, that it is becoming clear to the American people that strikes, lockouts, boycotts and mobs are not remedial agencies. The old-fashioned conviction is forcing itself upon the political and social world that if you sow corruption, there will spring up crime; if you plant sedition you will gather rebellion; if you scatter mob law, you will harvest mobs; if you sow to the winds of socialism and anarchy, you will reap the whirlwind of destruction and death..

CAPITAL oppresses labor while sustaining it. This is all wrong. But it is the suicide's solution of the problem to destroy capital.....

No question is settled until settled on the basis of right, not force; and in this settlement an ounce of common sense is worth barrels of dynamite.....

THE London Ag. Gazette says that there are individual cattle, sheep and pigs which inevitably pick your pockets. The Breeder's Gazette says that there is a whole gospel in the above sentence. The moral is: Supply their places with better ones, and the sooner done the better.....

PROF. GOESSMAN thinks the feeding of our home-raised fodder is as important a question as the raising of it. Fertilization, or the science of feeding plants, has made rapid advancement of late. Cattle feeding should be studied just as carefully .....

EVERY farm house should have a supply of lemons on hand during the hot weather, says the Kansas Farmer. You can make lemonade at one cent per glass. You will get five cents' worth of benefit out of it. There you make a clear profit of 400 per cent.....

REV. CANON BAGOT, the Irish dairy expert, asserts that 100 dairy factories will be established this year in Denmark. Unions are formed much as our farmers combine to establish creameries. Separators will be used almost exclusively. Butterine drives the dairymen into combination for mutual protection.....

THERE are many men, says the Live-Stock Indicator, who are proud to possess $1,000 or $5,000 cattle, just as there are men who pay $10,000 to $40,000 for a noted horse, *but as a business speculation, the last buyer is always the loser*.....

THE Journal of Agriculture says that the country has been flooded with a cheap lot of pedigree Short-horn stuff that are a disgrace to the name of thoroughbred cattle, and the same parties who have thrown them upon the market this year will have others for sale next, and more of them. If there is no way out of this difficulty the end is near at hand on all Short-horns.....

A WRITER in the Kansas City Indicator suggests taxing bulls at so much per head, and says the effect would be to kill off all the scrubs whose only service is to get cows with calf when the stock is not worth raising; and which thus do great injury to stock interest..

THE American Dairyman says that the dairyman who buys a big cow with a view to selling her carcass for beef when through with her in the dairy, has been aptly likened to the man who bought an engine several times too large for the work he had to do, with a view to selling it for more as old iron when worn out than he could a smaller engine. The waste of food in carrying the extra carcass of the big cow is similar to the waste of fuel in running the engine that was too large for the work to be performed. There is a comical likeness too in the money value, for fattening purposes, of the carcass of the old cow and the merchantable value of the old worn-out engine.....

A WRITER in Hoard's Dairyman cured the worst case of caked bag he ever saw in about four hours by thoroughly soaking and rubbing with the juice of pie plant.....

ACCORDING to several speakers at a late meeting of the Central N. Y. Farmers' Club, as reported in the Cultivator, in rearing animals we should begin right. Select from the best parents. Feed properly, and keep the calf growing. When milk is short, feed something else. Oats are good. When the calf is a year old keep it on grass in the Summer, and give extra food in the second Winter.....

DO not let a dairy shrink in July and August. Heavy losses are sustained by not keeping the stock well through the dry season. One successful dairyman cuts his corn fodder and mixes it with as much early-cut hay to feed in dry weather.....

A GOOD ration for feeding is four parts of shorts, two parts of ground oats, and one part of corn-meal. The above is a good ration for quantity of milk. Of course nothing in the way of feed is quite as good as fresh grass. When sowed corn is fed green and immature, Mr. Hoxie does not think it helps the flow of milk very much.....

HARRIS LEWIS says that in establishing a dairy breed, the farmer should go back to the calf and have a bony structure well developed. Guard against having a heifer very fat before she comes in. Oats and wheat shorts are splendid food to produce cattle, but when you feed cornmeal or cottonseed meal for that purpose, it is a mistake.....

THE Popular Science News relates the following as occurring between a Chicago man of a statistical turn of mind and a companion;—"Do you see that man over there? Well, he's a farmer down near Elgin. There he goes with a friend. They are going to get a drink; the farmer will pay for it. Now, let me see: that man will sweat half an hour next Spring to plow enough ground to raise one bushel of corn. The bushel of corn he will sell for 30 cents. He is going in there now to spend the 30 cents for two drinks, therefore the farmer and the corn have parted."....

THE Michigan Farmer says that a year ago, Messrs. Merrill & Fifield made a strong effort to buy the Hereford bull Hotspur, one of the most noted sons of Lord Wilton. The price asked was $5,000, which the firm considered too strong for them. But they wanted that bull, and wanted him bad. Finally, early this season, they decided to take him at the price named, and he was shipped to them. The voyage was a rough one, and the animal worried himself to death. It was found impossible to quiet him, and he never ceased his struggles until he had worn himself out. He was insured, we understand, for $3,000.....

Everywhere.

TRANSCONTINENTAL LETTERS.—LV.

MARY WAGER-FISHER.

From Ashland to San Francisco; a wet start; an agreeable stage companion; over the Siskéyou Mountains; in California; the Klamath Valley; the dry, brown, blazing Summers; an inconsiderate pie-maker; a despoiled creek; Mount Shasta.

As no train leaves Portland for Ashland on Sundays, there are usually fewer passengers for the stage on Monday morning than on any other day in the week, and for this reason the stage agent had advised us to wait until that day—a day that I endured with much disquiet, fearing that our long succession of brilliant days would end in rain; for, indeed, it was rarely that the Fall rains had held off so late. So you may judge of my disgust upon our arising at four o'clock on that eventful morning, to find a gentle drizzle descending! To make this stage journey with any degree of pleasure or profit required clear weather, and we had been anticipating it for a year. It was our first encounter with "ill luck" since leaving home, and I swallowed my breakfast and bundled myself inside the stage, in a mood which might aptly be expressed "as mad as a hornet." It was five o'clock and barely daybreak. Anaximander and the laddie, in rubber coats and rain hats, went on top with the driver. There was but one other passenger, and he came inside—a fine-looking man who proved to be an ex-United States Senator from Oregon, and who had lived in Portland for 25 years. He was inclined to be chatty, told me that he had crossed the continent 27 times, by rail and stage; had been a week at a time in the latter; had often made the stage ride we had just set out upon; had never been in the stage when it was stopped by highwaymen, but had only missed them upon two occasions by being a day behind or before them. That we were liable to be waylaid by robbers at any time, was an incident of which I had not seriously thought, but the possibility added a spice of danger to the undertaking. However, a year and a half had elapsed since the last robbery, and the Senator said that the robbers rarely disturbed passengers, but confined their seizures to the mails and packages of the express companies. Even now, Wells, Fargo & Co., send an armed messenger on certain days in the week to guard their treasure box. If he is quick in getting his revolver up before the robbers take aim, the latter take to their heels, or are shot; but if *vice versa*, there is nothing better to do than to submit to their demands. The stage drivers go unarmed—there are five employed on the route and they are paid each $100 a month, with board. The stage fare for the entire distance—125 miles—is $15. Only a limited amount of baggage is carried free, what is over weight is charged eight cents a pound. A through unlimited ticket between Portland and San Francisco can be had for $36—a limited ticket for $32. The distance is 738 miles. Four cents a mile is the highest rate railroads can charge in Oregon—according to a recent railroad enactmen. The legal rate of interest is 10 per cent., but the law is easily evaded, and much money is loaned for even a higher rate.

For an hour or so we rattled along over the hard road on which the rain had only laid the dust, but if there was a rough place or a stretch of corduroy, the driver drove over it with increased speed, until I was "fairly jolted to death." This was a small coach—none of them have springs—and it was lightly loaded. Then we stopped at a farm for breakfast and made a change of horses, taking on six instead of four, and soon after began the ascent of the Siskéyou Mountains, crossing them in a pass at the south, at the hight of 5000 feet. It had taken us two hours to make the last six miles. All the way we drove through the mountain forest, magnificent trees of Sugar Pine with beautiful bark, while on many of the oaks were great, dark-green pendent branches of a parasite, here called mistletoe, which gave a peculiarly luxuriant and wild effect to the forests. Near the summit the Senator pointed out the spot where the stage had been stopped in daylight by bandits. Near by the road I saw in bloom the Torch Plant, sometimes called "Red-hot Poker," and it was the only place in which I have seen it growing wild. Just as we crossed the summit the clouds had begun to break and disperse, and high up through a rift appeared a great snow-capped mountain peak. It was Shasta, and at the next halt the driver made, I climbed up to my place on his seat, where I sat, with my little boy between us, until half-past six o'clock the next morning. Down the mountain we rattled with the speed of a Jehu, and thence on for miles and miles, through the Klamath Valley, crossing Klamath River on a ferry propelled by the current of the stream.

Meantime, the sky continued to clear until not a cloud remained. We had crossed the State line into California, and the laddie seemed disappointed that we could not see the line; that there was not even so much as a stream of water or a fence to mark the division between the Web-foot and the Golden States. I have read that a post with a rag waving from the top was planted by the roadside, but I failed to see it. On our high seat, we soon began to feel the scorching effect of the glaring California sun. No rain had fallen here, and the dryness and dust increased all the way. The Klamath Valley is not of great width, and was very sparsely populated along our route. There was not a green field to be seen; everything was in the brown of Summer, the rolling foot-hills on either side bearing scrub oaks, clumps of grease brush, chapparel and sage brush. Some variety was given to the color of the landscape by occasional fields of grain stubble, the stubble being peculiarly bright, probably because of the dryness of the atmosphere. I have never yet met with a Californian who did not like, or pretend to like, the long summer season without rain, and to lay marked stress upon the conveniences and advantages of not being obliged to make provision for a downpour. But I love the rain, and I am sure that I should wear out nervously in the long, dry Summers and pitiless sunshine of the interior valleys in California, where one finds two or three of the twenty or more climates with which this great State is blessed, and if one will look on a map he will find that California is nearly as long as from Massachusetts to Georgia, and has just as many climates.

At half past eleven we stopped for change of horses and for dinner. The eating stations along this part of the route are merely farm houses—one-story buildings, "long and low," planted long distances apart, and set around with shade and fruit trees—locust and Lombardy Poplars, being favorites for shade. The farmerine at the dinner station was a little behind with the meal, giving as an excuse that it was Monday—the Chinaman had been washing, and she herself had a toothache. We had soup and roast beef, baked beans, potatoes, nice honey in the comb—from hives on the ranch—and pie, two kinds—always pie without a thought, seemingly, that there are people in the world who regard it as an insult to fruit, to put it between pie crust dough. Our next spin was over a hard and level road to Yerka, which we were to reach at three o'clock with four horses. The driver was very reticent, briefly answering questions, and occasionally venturing a bit of information. All the time at intervals, we had views of the top of Shasta which we were gradually nearing "You see that post there by the road-side with the stones packed around the bottom?" observed the holder of the ribbons: "Well, that marks the grave of a stage robber. A messenger shot him on that very spot, and he was buried there Them messengers make quick work of 'em. He was from Illinois; all those fellows are generally escaped convicts from the East." As we were driving along a stream of water for some, miles he said, "That's a noted creek." "What is it called?" "The Cottonwood." "And for what is it noted?" I continued. "For the number of men who've been drowned in it, and horses, and for the gold that's been taken out of it—millions of dollars. They used to just pick out the clear nuggets of gold. But its all taken out now, I s'pose." It was a most innocent and common-place-looking creek, with cattle at intervals drinking in it, and with cottonwood trees growing sparsely along its banks. The road lay through the open valley with rarely a fence on either side; the hills brown, reddish-brown or mouse-brown—they all had a varying tint—continued to bear their orchards of scrub growth, and further back and higher up, occasional plantations of pines. We met the stage coming from the opposite end of the route, and had passed probably three or four wagons in the 50 miles we had come. Finally, we came into the Shasta Valley with Mt. Shasta looming up in front of us; from base to summit, and for fully 12 hours, we were in full view of it, but from no place was the view so fine as from the Shasta Valley. The mountain had less snow on it than usual, because of the unusual dryness and heat of the Summer; but absence of snow below the summit revealed what ordinarily cannot be seen—the extent of volcanic action. On one side of the mountain a crater was evidently built up almost as high as the peak, and some views of Shasta, particularly taken from Strawberry Valley, show two peaks of about equal magnitude. One of the foot-hills of the mountain is called Black Butte, and it is quite a mountain in itself, and all in the foreground and clustering about the base of the mountain are a multitude of conical mounds of varying hight and size, but as regular in outline as if thrown up "to order." The mountain is wooded part way up. The nearest approach we made to it was within a distance of 18 miles, and it did not look to be over five.

RURAL SPECIAL REPORTS.

Dakota.

ALEXANDRIA, Hanson Co., June 10.—I planted the Alaska Pea, sent in the RURAL'S F. S. D, on April 21; to-day there are peas ready to cook—quickest time in the world, I think. American Wonder, (a good pea) and Salner's Earliest and Best are more than a length behind. Salner's so-called Earliest and Best is a very poor yielder. Frequent showers and hot weather are rushing things.

T. H. Y.

Kansas.

LYONS, RICE CO., JUNE 12.—Prices for the crops of 1885 have been very low. Wheat selling for 25 cents to 60 cents a bushel; corn 15 cents to 19 cents a bushel; oats 17 cents; old potatoes 40 cents. No rain since May 6; weather very warm and dry. Wheat will be 40 per cent. of a full average crop; oats half a crop, should there be rain to enable them to fill out. Corn very promising; as nearly all was "listed," the dry weather was very severe on it; it is fully two weeks behind the average growth. I don't think there is more than half a stand. Hay very light. Sorghum halapense came through the Winter well and is growing nicely. Trees were killed very badly last Winter, especially peaches and apricots.

E. S. J.

Ohio.

DAYTON, Montgomery Co., June 15.—The weather has been favorable here for growing crops, some barley is harvested, and wheat and oats promise to be of more than average

yield. Clover and Timothy, where not winter-hurt, will give large returns, while corn is now in such thrifty growth as to promise well for future crops this Fall. Scarcely half last year's acreage in potatoes; while tobacco will fall short of last season's acreage. More was planted last year than could be marketed or properly cared for, and the quality will perhaps be better if it receives proper culture.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

TEMPORARY OR PERMANENT STERILITY IN MARES.

J. W. B., Shelbyville, Tenn.—Why do some mares not get with foal, and why don't some breed every year? Can anything be done for such animals?

ANSWERED BY F. L. KILBORNE.

Temporary or permanent sterility in the mare is not uncommon, only 60 to 75 per cent. of those put to the horse get with foal. Why there should be so large a percent. unfruitful, even under favorable conditions, we cannot say. There are various known conditions that tend to prevent conception, while on the other hand there is in many cases no apparent cause for the sterility. Any malformation of the generative organs, unless removable, usually produces permanent sterility. Such malformation may or may not be recognized during the life of the animal. Disease or derangement of any part of the generative apparatus may produce either temporary or permanent sterility; and any general disease or disease of any other important organ usually produces temporary unfruitfulness. Some mares will not breed while nursing a foal, so that they will breed only every other year. The diet has much to do with sterility. Animals that are poorly or improperly fed, and especially those that are pampered and overfed, are very likely to be unfruitful as long as that state of affairs exists. A good, healthy, working condition is the most favorable. There is no remedy, except to avoid as far as possible all conditions that tend to prevent a successful fecundation. Keep a brood mare always in prime, healthy condition, but *not too fat*. Work moderately and allow daily exercise when not at work. Idleness and much fat are always unfavorable. See that the surroundings are clean and healthy, the stables light, airy and free from foul odors. Daily grooming is very desirable, and will go a great way towards keeping a mare in good breeding condition.

ITCH IN COWS.

D. H. L., Renovo, Pa.—1. What is a remedy for itch in a cow? 2. What's a good book on the cow and her diseases?

ANSWERED BY F. L. KILBORNE.

1. Itch, also known as mange, scabies or scab, etc., is a disease of the skin, due to the presence of minute animal parasites, or acari. The disease is common to all domestic animals, each animal having its peculiar itch parasite, or in some cases, as with the horse and cow, three or four such parasites. The treatment is very simple, but to be effective it must be thorough. First wash the animal with warm, strong, soft-soap suds and a stiff brush, to break up and remove all dandruff and scabs or crusts. Then apply a decoction of tobacco made by boiling one pound of leaf or stem tobacco in each 12 quarts of water. Other parasiticides may be used with equal success, but this is one of the simplest and safest remedies, and very effectual. [See what Mr. Woodward says in the last issue about remedies from scab in sheep. The same treatment will be effectual for itch or scab in all kinds of domestic animals.—EDS.] Repeat the application on the third and sixth days, first washing with the soap-suds in each case. The three applications should be sufficient. It will also be desirable to treat the stable and rubbing-posts to a similar wash. 2. "The Farmer's Veterinary Adviser," by Prof. James Law, of Cornell University, Ithaca, N. Y., price $3—to be had of the author, is one of the best.

YACHTING.

C. H. M., Cayuga N. Y. This is an agricultural, not a nautical paper, so we really cannot spare room for "a good account of yachts, their construction, rig and sailing." In view of the numerous yacht races the coming season, however, the following brief answers to some of our friend's questions will be of general interest: A "boom" is the spar or stick attached to the foot of a sail to keep it over a boat's side; a "gaff" is the spar fixed to the head of the sail for the same purpose. Sloop yachts, such as the contestants for the America's Cup last year and this, carry two booms—the "main boom" attached to the mainsail, and the "spinnaker boom," which, when not in use, is generally carried vertically against the mast, and lowered on the side of the boat opposite that over which the main boom happens to hang, when the spinnaker is to be set in sailing before the wind. Then the main sail spreads out on one side of the boat and the spinnaker on the other, and the vessel sails on a pretty even keel. The "bowsprit" is the spar stuck out in front of the boat to hold the headsails—the sails set in front of the mast. The top-sails are the upper sails: the "gaff" top-sail is the triangular sail set over the mainsail: the "club" topsail is a sail set in light winds over the gaff topsail and attached to "clubs," or small spars, to make it reach higher up in the air. The gib "top-sail" is the topmost gib or headsail. "Working to windward" is an expression used to indicate that the vessel is making a number of tacks to reach a point in the direction from which the wind is blowing; and "sailing close to the wind," or "close-hauled," indicates that she is headed as near to the point from which the wind is blowing as she can be made to sail.

A JERSEY COW BECOMES STERILE.

D. C., Deer Park, N. Y.—My eight-year-old Jersey cow has dropped six calves; has never been dry since she dropped the first; has given 14 quarts of milk per day, which would make 12½ pounds of butter per week; she is a good feeder and in fair condition. Eight months ago she dropped a calf and has been in heat regularly since, and been served several times by different bulls, but doesn't get with calf; what can be done for her?

ANSWERED BY F. L. KILBORNE.

Without knowing the cause we cannot suggest a remedy. It may be due to some general disease, or to disease of the generative organs. Tuberculosis would be suspected if this disease is in your herd. Were her ancestors prolific? If not, she may inherit a tendency to become sterile early. We can only suggest that you call a competent veterinarian to personally examine her, although we suspect the cow may be permanently sterile.

GOITRE IN A HORSE.

E. J. R., Loweville, N. Y.—My horse has a difficulty in breathing as if troubled with the heaves, but there is no cough. On each side of his neck, well up under the jaw, there is a bunch the size of a large hen's egg. That on the left side came when the trouble began. What should be done?

ANS.—The trouble is probably goitre, a diseased and enlarged condition of the thyroid body, due to debility or the drinking of water from lime-stone regions, or both. Give one dram iodide of potassium night and morning. Rub the swellings thoroughly every other day with tincture of iodine; or, if the swellings are soft, draw off any liquid they may contain with a hypodermic syringe, and inject a solution of compound tincture of iodine, one part, and water, four or five parts. Keep the animal in good healthy condition, and use rain-water for drinking. Continue the treatment for several weeks if necessary. Recovery will probably be slow.

TO REMOVE WARTS ON A COW'S TEATS.

J. C. P., Minneapolis, Minn.—The warts on the teats of your cow should be easily and safely removed. With a pair of sharp scissors cut the warts close to the teat. Then thoroughly cauterize the cut surfaces with nitrate of silver. They can be best removed while the cow is dry. If they crack open or become sore before then, cauterize the raw surfaces by touching with a stick of the nitrate of silver.

Miscellaneous.

C. A. K., Beattie, Kan.—1. When and how should strawberries be set out? 2. What is a remedy for black striped bugs on water-melons? 3. What for the cabbage worm? 4. What's a good feed for young ducks and Guineas? 5. How can Ground Squirrels be destroyed?

ANS.—1. Any time after fruiting when the soil is moist, up to September 15. Spring is perhaps the best time. If for the field, set the plants three feet by two apart. If for garden, set three feet by one foot. 2. Sprinkle the leaves, when covered with dew, with plaster, or even fine, dry soil. 3. The best remedy is to blow pyrethrum (or buhach) powder upon them through bellows. Or wet two tablespoonfuls of the powder with alcohol, add this to two gallons of water, and spray the plants with this. 4. The first food for ducks may be bread moistened with milk; curds or hard-boiled eggs chopped fine are also good for them. After a few days' corn meal, boiled and mixed with milk, boiled potatoes, a few chives, or lettuce chopped fine, will be a good addition. They thrive well on all kinds of sopped food, such as barley meal and water mixed thin. Later on pot-herbs will do them good, raw, chopped fine, mixed with bran soaked in water, with barley and boiled potatoes beaten up together. The Guinea chicks require food almost immediately—at most within six hours after hatching—and should be fed and cared for the same as young turkeys: but they require more constant feeding than any other chicks, as a few hours' abstinence is generally fatal. They also require a good deal of animal food to make them do well, especially in Winter. 5. The name Ground Squirrel is given to two kinds of animals in the West—the Striped and Spotted Prairie Squirrel—(Spermophilus tredecimlineatus), and the Tamias striatus, or Chip-muck. The first only, however, is a real squirrel; but unlike other varieties of squirrels it never inhabits timber when prairie is near at hand. It is very destructive in cornfields by digging up the corn which it carries to its burrow, often necessitating replanting. The pests also inflict serious injury on some other crops. They soon disappear before the plow, however, and are readily trapped or shot, and a few buckets of water will always drown one or a pair out of their hole. Strychnine is also used to kill them, mixed with the food of which they are fond. The same modes of extermination will be effective with the Gray Prairie Squirrel, which is also called "Ground Squirrel" in some places, though it is not so easily drowned out of its hole, especially when it is in a bank or drain—a favorite location.

E. A., Aberdeen, Dak.—1. At what age should I breed my two-year-old colt without running any risk of injuring her? Two of my horses sweat a good deal across the kidneys when they have drank water after a hard day's work; what should be done?

ANS.—1. If the colt is quite forward it will do to breed her now. But if she is not, we would prefer to wait a year, when we would expect a better foal with less injury to the young mare. 2. If there are no other symptoms—no weakness or tenderness across the kidneys—probably no medicinal treatment is needed. Work more carefully and give the drinking water frequently, in small quantities. Attend to the general comfort of the animals; see that the food is wholesome and the surroundings healthy.

S. C. M., West Millcreek, Pa.—We have now a very effective remedy for moles in Hales' Mole-trap, which in its way is simply perfection. The trap is now reduced to $2, and will last a lifetime. It is easily set, though a little experience is needed to adjust it just right. Follow the directions. The earth over the mole run should be gently pressed down, and the trap set so that the plate merely *rests* upon the compressed soil. It will never fail. The Isbell trap ($1.50) is good, but after several years' experience, we much prefer the Hales. Address H. Hales, Ridgewood, Bergen Co., N. J., or you may buy it of any seedsman.

F. G. W., Oswego Co., N. Y.—A valuable trotting mare got with foal accidentally about a week ago; can anything be done to prevent her from having a foal?

ANS.—We cannot recommend any of the methods that might be used to produce an abortion. Less injury will propably be done the mare by allowing her to carry the foal, than by attempting to produce an abortion in the way desired.

F. H. B., Meridian, N. Y.—My three-year old colt has a bunch growing on the back of his hind leg, at the bottom of the gambrel joint; what should be done for it?

ANS. Without knowing the nature or cause of the bunch, we cannot prescribe definitely. Painting with tincture of iodine twice a week for a few weeks might be beneficial. Excision may be demanded.

G. W. T., Stelton, N. J.—My horse has a tremendous swelling on his sheath, due probably to bad castration; can it be removed in any way except by excision?

ANS.—Excision is probably the only remedy. Unless vital structures are implicated the operation should be successfully performed by a competent operator.

R. M. A., Fredericktown, Mo.—My mare dropped a colt six weeks ago; she makes water all the time while driving; what should be done with her.

ANS.—Consult a veterinary surgeon if the difficulty does not soon remedy itself. We cannot advise you so that you would be able to treat the case yourself.

P. P. S., Mehoopany, Pa.—There is no remedy that is not too costly for lice swarming on a cherry tree. Tobacco tea sprayed through a force pump and cyclone nozzle will kill the lice.

E. G. L., Essex, N. Y.—The grass sent for name is Blue Grass—Poa pratensis.

DISCUSSION.

T. L. K., McMINN Co., Tenn.—That was an interesting article on salt feeding in a late RURAL, but I don't think what was said against the use of salt will make much difference in the quantity of salt fed. All farmers and farmers' wives know the beneficial effects upon milk and butter of keeping the cows regularly salted. All hunters know of the "licks" dug out in salty places by deer and other wild animals. We would like to have some one explain how these wild creatures have acquired this "fixed habit" that is so hurtful to them. Guided by instinct, they readily discriminate between wholesome and unwholesome herbage around them. If salt was unnecessary and hurtful, would not instinct teach them to reject it? Too much salt is injurious, and so is too much corn, oats or clover, but what would our stock do if they were deprived of everything which, taken in excess, proves injurious? I never knew an animal that had salt continually before it, to eat too much. Animals seem to know just what they require. They take a few licks at the salt trough and then go about their business. If the great laboratories of nature should get out of order and the ocean be deprived of its salt, those who now object to the substance would call far more loudly for its return. A few days since, while walking in my garden, I saw a common gray rabbit standing on his hind legs with his head resting against my meat house. On watching him closely I found that he was eagerly licking salt from the wall. It had exuded through the brick, and he had discovered, either by accident or instinct, where he could draw his rations free of charge. Now, please, tell us where this "victim" of a "dreadful habit," a poor little rabbit, acquired his taste for this unwholesome stimulant.

Miscellaneous Advertising.

Scrofula

Probably no form of disease is so generally distributed among our whole population as scrofula. Almost every individual has this latent poison coursing his veins. The terrible sufferings endured by those afflicted with scrofulous sores cannot be understood by others, and their gratitude on finding a remedy that cures them, astonishes a well person. The wonderful power of

Hood's Sarsaparilla

in eradicating every form of Scrofula has been so clearly and fully demonstrated that it leaves no doubt that it is the greatest medical discovery of this generation. It is made by C. I. HOOD & CO., Lowell, Mass., and is sold by all druggists.

CHINA-LINED

ICE PITCHERS.

The Linings of our Pitchers are held in position by the Cover, which is secured by thumb-screws and is easily removed and replaced, thus facilitating the cleansing of both pitcher and lining. The lining is of the finest Stone China, and has no equal for preserving ice and keeping water pure.

SALESROOMS:

37 UNION SQUARE,

NEW YORK.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JULY 3, 1886.

OF eight Japan Chestnuts planted in May, all sprouted and are now about seven inches high.

WE find that the Rancocas is essentially as early as the Hansell. The latter will ripen a berry or so first, but the other will give its main crop as early. The quality of the Rancocas is as good, while the plants are more vigorous and fruitful.

MR. G. M. VANNESS, of Morris Co., N. J., has sent us two stools, with the soil attached, of wheat and chess plants to show, as he believes, that wheat will turn to chess. We carefully washed out the soil from the roots, and found that they easily separated without rupturing a fiber.

REFERRING to the article on the RURAL'S rye-wheat hybrids, with which Dr. Trelease kindly favors us, it may be stated that many of the plants have leaves and stems like those of rye in color. The plants, taken as a whole, which "most resemble rye" show this at a glance, and it has been remarked upon by many.

WE wish we could induce all seedsmen, florists and nurserymen to discontinue the use of the word hybrid as applied to crosses between mere varieties. It should be confined to crosses between species and genera. If they had more interest in the truth and propriety of things and less in "taking" names, they would do it. The Am. Pom. Society, Am Hort. Society, and Society of Nurserymen should take this matter up, and act upon it.

KEEP an eye on the managers of your fair, friends. How many of them are going into the liquor business this Fall? They would doubtless feel insulted if you called them rum-sellers, but what else are they if they accept money for a liquor privilege? By the way, how much better are you if you stand by and wink at such practices? Come out and tell folks what you think about this grog business. "Silence gives consent" every time. If you want to put the practice down, talk about it and get all your friends to talk about it too. Between you, you can talk it to death.

TEACH the horses to mind when they are spoken to. The importance of this cannot be overestimated. An intelligent horse knows his driver, and will, if so disposed, readily take advantage of any lack of decision. Not long since we saw two frightened horses running on the street. One of them, at a single sharp command from his master, stopped short. The other only ran the faster at the shouts of the crowd. Teach them to mind at a single word. Never fool with them by giving half a dozen orders when one would do, or by shouting or menacing them. The typical woman driver lets the horse see at once that she is afraid of him. She jerks his bit ten times per minute, clucks at him continually and says "Whoa!" a dozen times before he makes up his mind to stop. Such treatment will make a spirited horse unsafe, or make a fool out of a lazy one.

ON an average throughout the country, harvest will be fully a fortnight earlier than usual this year. It will still be some time, however, before the crops move to market, though cutting is now in full blast as far north as parts of Ohio, Indiana, Illinois, Missouri and Kansas, and before this reaches our readers, the bustle and excitement of busy, joyous harvest will have moved steadily north. This is just the time, therefore, when it will be most advantageous to be able to form a fair idea of what the outcome of the various crops will be in this and other countries, because each will then be in a position to judge what the prices should be for his products. Our next issue will be our regular annual "Crop Report," compiled from special local reports from over 4,000 correspondents in nearly every county in the Union. We have delayed it somewhat later than usual, so that our conclusions may approximate all the closer to the truth. As in the case of every special number, there will, of course, be some readers who will not take any particular interest in the issue, and who will miss for once some one or more departments in which they find special pleasure or instruction. All, however, ought to feel a deep interest in the crops of the country, for it is these that set and keep every industry in the land in motion, and the prosperity of the farmer, dependent on his crops and the prices therefor, is identical with the prosperity of the whole country.

ONE of the surprising things to the writer is that country people—yes, city people—having even a square rod of ground, do not raise strawberries from seed. To-day, June 22, we have gone over our seedling plot to mark those which seem to be worth propagating. There are perhaps 200 plants raised from the seeds of berries selected last year and the year before. From these we gathered a large plate full of clusters and single berries which, as to size, color, firmness and qualities, were equal to any of the 66 varieties under trial. We do not intend to say that any one berry possessed all these qualities, but that, taking them as they come, the average would be as high as selected pickings from the same number of varieties which are being tested from various sources. Now it is almost as easy to raise strawberries from seeds as from plants purchased. If seeds are sown now, many of the plants will fruit next Summer—all, the Summer after. We have then to mark the best while in fruit and to transplant them as soon as the fruit is picked. Such plants, if well treated, will bear well next Summer—better than nine-tenths of of the so-called potted plants sold at a high price by nurserymen.

FARMERS are frequently puzzled to account for the fact that while money is loaned on United States securities at less than 3½ per cent., and on security of good railroad stock or State and municipal bonds at a trifle more, they have to pay from six to 10 per cent. for loans, though they offer the most solid security—the earth itself and the improvements thereon. The men of business, the manufacturers and merchants of Canada, are now perplexed at a like seeming discrimination against them. They complain at having to pay seven to eight per cent. for loans while stockbrokers can readily get accommodation at four to five per cent. The explanation in both cases is simple. Bankers and other lenders prefer as security that which they can sell the quickest in case of default. Stocks and bonds can be sold at once, while the merchant's paper and the farmer's mortgage cannot be so readily disposed of. A suspicious security, easily converted into cash, sometimes finds a much readier market than an unquestionable security which cannot be realized on without delay and legal trouble.

THE SMOKE TREE.

Bless this dear old plant! If we were constrained to part with all our shrubs but one, we should hold on to the Smoke Tree. At this time (June 25) it is easy as one looks at it from a little distance, to fancy it a cloud tinted with the faintest rose and the faintest green blended together, or a mass of smoke such as may issue from a combination of colored fireworks. There is no shrub like it while in bloom. The delicate, downy inflorescence is not due to the flowers, which are quite inconspicuous, but to the feathery pedicels that elongate and so diffuse themselves as to conceal the leaves, while because of their delicacy we see only softly blending colors that might well indeed be smoke or a cloud.

We have seen specimens of this little tree 20 feet in diameter—a mass of light, mossy green and purple or rose. Later all this becomes gray, and its beauty is gone, though the later growth of leaves takes its place in a measure. One likes old-fashioned things that bring to mind the old homestead or the familiar country gardens of early days, and the Smoke Tree, though among the choicest collections of plants of more recent times, seems like an old and tried friend among aristocratic strangers.

It has been said that this little tree, so distinct from all others, so oddly beautiful to those who see it for the first time, rejoices in a dry, warm soil. It is true. But it also thrives in heavy, moist soils. We have it in both positions, and it seems to prefer the latter. Its botanical name is Rhus Cotinus, and it is known familiarly as the Purple Fringe, Wig Tree and Venetian Sumach, as well as the Smoke Tree.

THE WAR AGAINST FRAUDULENT BUTTER.

THE House Committee on Agriculture are hopeful that the Senate will pass the Oleomargarine Bill, with possibly a reduction of the five cent tax provided by it as it left the House. It will certainly be acted upon next week. The House will agree on any amendments on which the Senate may insist, if they do not interfere with the chief end sought by the bill—to force the manufacturers and dealers in bogus butter to make the goods of wholesome materials and sell them for what they really are. State legislation, however stringent, has in every case been unable to do this; for State legislation cannot provide for the supervision of manufacture, or for following the product from the maker to the final purchaser; and federal legislation can, to a great extent, do this, and federal legislation is therefore essential to the rightful protection of the producers and consumers of genuine dairy goods.

Senator Edmunds, Chairman of the Senate Committee on the Judiciary, who voted to refer the bill to that Committee, and was supposed to be at least "doubtful," in a letter to a Vermont farmer declares himself strongly "in favor of Congress taxing bogus butter, so as to give makers of real butter their fair rights," and adds that he needs no "urging to look after the interests of our farmers." A good deal of urging will not be wasted, however, on him or any other Senator. Edmunds is reputed to be one of the very best constitutional lawyers in the Senate, and the fact that his re-election will be decided this coming Fall weakens not a jot his opinion as to the constitutionality of the Oleomargarine Law; for, of course, if he thought it unconstitutional, he wouldn't support it. Should the farmers' influence of the Green Mountain State be against him, he might find it more dangerous to his ambition than even that of Brother Blaine.

The fraudulent makers of counterfeit butter are exerting themselves to the utmost to secure the defeat of the measure. Whereever possible they are getting public bodies, such as Boards of Trade, etc., to petition against it, and the great Chicago packing houses have compelled their workmen to sign a petition urging the Senate to reject the bill. Thousands of workmen signed it simply because they were compelled to do so. Desperate indeed must be the case of the bogus butter people when they are forced to resort to such methods. A business that can muster as supporters only an army of paid "scientists" and intimidated workmen has no business out in the sunlight. Keep on in the good work, friends. The "bogus" army is shaking.

LEGAL HONOR IN THE SENATE.

ON June 10 the United States Senate, by a vote of 37 to 11, passed a bill, introduced by Senator Beck of Kentucky, prohibiting Senators and Representatives from being the hired attorneys of railroad corporations on which they are to sit as judges. Senator Hawley, of Conn., says the bill was sprung upon the Senate suddenly and stampeded through. The general public say that its obvious propriety left the Senators without any ready ground of opposition and without the effrontery to vote against it. Out of the 76 Senators, however, 65 are lawyers, and if the bill becomes law, a large proportion of these who are either permanently retained by the roads or receive large fees from them, will be deprived of a rich source of income. Remember, many of them are employed, at high figures, precisely because their position as legislators enables them to be of service to their clients in matters of legislation, and the whole course of the Senate shows that it has been steadily subservient to these great subsidized corporations, and that any law, however urgently demanded by the interests of the people, if hurtful to those of any of these corporations, can be passed by that body only when the force of public sentiment in its favor becomes irresistible.

On June 22, therefore, the bill was "reconsidered," by a vote of 31 to 21, and instead of being passed, as the public had a right to expect, was sent to the Committee on the Judiciary made up entirely of lawyers, most of whom are the hired agents of corporations. Thirteen of the Senators—ten of them Republicans—who originally voted for the bill, subsequently voted in favor of putting its fate into the hands of its deadly enemies. Mitchell, of Oregon, wanted to swamp the bill with ridiculous amendments. Evarts, of New York, regarded it as a stigma on the Senate and an insult and reproach to the legal profession, whose members are incapable of subordinating the interests of the public to those of their clients and themselves! Edmunds of Vermont, thought it required an ideal honesty in Congressmen, such as can be found only in an angel-governed world.

In a body made up almost entirely of lawyers whose *esprit de corps* is notorious, Evart's appeal was the most powerful; but the Federal laws already contain many provisions for prohibiting lawyers in Congress from accepting fees to work for corporations and against the people. By laws passed by the Senate, a Senator is forbidden to take fees for procuring a contract or an office, or for any sort of service on any question which may be brought before him in his official capacity; or to take bribes, or to hold an interest in public contracts, etc. If these are not insults to the Senate or the legal profession, why should the provisions of the Beck bill be so regarded?

All the special pleading of all the lawyers in the Senate, which contains many of the best special pleaders in the country, will not convince the great public that men who, as representatives of the people in the highest legislative body in the nation, are called upon to legislate on the obligations of subsidized railroads to the Government and the people, should have fat fees from those very railroads at the time in their pockets. A question forced on public attention by this discussion is: "Is it right, is it expedient, is it for the public interest, that 65 out of our 76 Senators should be lawyers?"

BREVITIES.

DANIEL RUPERT gives some good advice on page 437.

Is the buckwheat land ready? Don't sow too late. A late frost may spoil the crop.

OUR next portrait will probably be that of the RURAL'S friend, Gen. William H. Noble of Connecticut.

THOSE interested in cold storage will read Pres. Wilder's statements, under What Others Say, with interest.

JUNE 20. To-day we find several ripe Hansell Raspberries. There is not upon any other red variety a berry that is even showing color. A few of the earliest caps are turning a little.

THE RURAL every week, in its News Columns, gives in the most condensed form the news of the world. It is carefully selected and rewritten from week to week from all available sources.

GEN. CLAY'S views are striking, if somewhat peculiar. We like what he says about the engravings of animals which are not drawn from life, but made by rule and line to suit the ideal fancy of the times.

IT has been shown that the roots of corn four feet high may and probably do extend, horizontally at least six feet—and most of these roots are within three inches of the surface. Knowing this, our friends must cultivate to suit themselves.

THE Marlboro in the place of its origin is a very thrifty raspberry. We have seen canes 10 feet high. Mr. Caywood himself planted a bush at the Rural Grounds, the canes of which were eight feet high. But with us this vigor does not last. The Marlboro is this season no more vigorous than the Hansell.

REMEMBER the prizes. Ten dollars each for the largest Bird Cantaloupe, the largest watermelon, the longest ear of the Angel of Midnight Corn, and 10 of the heaviest pods from the Alaska Pea. The prizes will be awarded October 1. Competitors must advise us by mail as to the weight or size of peas, melons or corn. Are you trying to secure the prize? Several reports from the peas have come to hand.

SENATOR MITCHELL, of Oregon, Hipple-Mitchell of unsavory notoriety, who after having been relegated to private life for one term for the good of his party, was re-elected to the Senate last year by Republican-Democratic jugglery, which materially helped to lose the State to his party this year, appears to be one of the men who regard a place in the Senate as valuable chiefly as a means of serving wealthy corporations in return for past and prospective favors. Isn't it notorious that he owes his present position in a great measure to railroad influence during his hard struggle for the Senatorship before the Legislature last Fall? During the late Northern Pacific Forfeiture debate he was one of the most insidious and persistent foes of the bill, and by a deceptive amendment would have rendered one of its chief provisions abortive, were it not for the vigilance of Van Wyck, of Nebraska; but it was during the debate on Beck's Honest Congressmen Bill that Hipple-Mitchell outdid himself. In order to make the bill ridiculous, he introduced an amendment prohibiting Congressional lawyers from appearing in any case in which the interests of any organization, association or partnership is concerned, because, in sooth, Congress has to legislate in a general way on matters connected with them, while it has to legislate specially with regard to land-grant roads. With little sense of decency or dignity, a great deal of plausible cunning, and an unscrupulous eye ever open to the "main chance," a poor sort of creature indeed seems this Oregon Mitchell.

Indust'l Societies.

MICHIGAN STATE HORTICULTURAL SOCIETY.

(RURAL SPECIAL REPORT.)

Spring strawberry planting preferred to fall; too many pistillate plants; best varieties for market; matted rows better than hills; mulching; picking; how to eat strawberries; raspberries for market; picking and marketing; blackberries; "plant patents"; grapes for market; mildew; cucumbers.

The summer meeting of this Society was held in Lansing, beginniug June 15 and holding through the 16th. The program was very full and interesting, mostly discussions. "Strawberries for Market" was the first general topic. All the growers present preferred spring to fall planting. In Spring the plants are more likely to live, as the weather is more congenial and a crop can be had as soon as from fall planting. President Lyon remarked that we should plant as early as possible; a gain of a week is usually very marked in its effects. There was some expression of disfavor concerning the introduction of so many pistillate varieties. Perhaps the using of pistillate plants as mothers in crossing for new sorts has a tendency to increase pistillate varieties. Best varieties for market in general are Wilson and Crescent. Wilson often blights and Crescent overbears. Mr. Scott, a very successful grower at Ann Arbor, on heavy soil finds Mt. Vernon the very best market berry. Matted rows, a foot to fifteen inches wide, are preferable to hills for most markets and most varieties. Bidwell and Sharpless do best in hills. A. G. Gulley, South Haven, said that his Wilsons and Crescents in matted rows are as good as those in hills.

A letter from Parker Earle, of Illinois, recommended planting in spring. He has mostly Crescents, three rows to one of some perfect-flowered sort. He cultivates clean in matted rows, mulches with straw which is not removed until after harvesting, and ships in 24-quart crates. It was generally agreed that the proper way to mulch is to cover the plants lightly and the ground between the rows heavily, and leave the mulch on until the berries are picked. Some burn off the mulch. Strawberries demand intensive culture. Most growers use tickets for berry-pickers and pay a cent and a-half a quart, although that is too much for Crescents. Berries must be sorted by a careful man before they are put upon the market. Most growers pay pickers once a week, although some do not pay until the end of the season. It is best to use four-quart berry-carriers, and to make pickers fill their carriers before leaving the field. Fast pickers may take two carriers. Do not allow pickers to snap off the berries or to tread down the vines.

Few people know how to eat strawberries to advantage. The flavor of the different sorts is always disguised when the berries are smothered in sugar and cream. They are usually best to cultivated palates when eaten with the addition of a little sugar and water. The poorer the berries, the more sugar and cream we use. Sec. Garfield has the best sorts brought to the table with hulls on, and eats them from the hand.

An interesting feature of the first evening's program was a series of short talks, illustrated by charts, by students from the botany classes of Dr. Beal, of the Agricultural College. For market, red raspberries seem preferable to the black-caps. Turner, Cuthbert, Marlboro, Brandywine, Tyler, Souhegan, Shaffer, Ohio, Mammoth Cluster and Doolittle were mentioned as leading market sorts. For market, the first desideratum is firmness. Fall planting was generally preferred for reds, and spring planting for caps. Price paid for picking varies from one-and-a-half to two-and-a-half cents. Pint boxes with sloping sides are generally preferred. E. A. Scott uses tickets for one, two, three, four, six and eight quarts, and as these accumulate, they are taken up and the picker receives 20-quart tickets.

Pres. Lyon despairs of finding a hardy blackberry. He prefers to plant the best sorts and lay them down for Winter.

A communication was read from Jacob Moore, asking that the society consider the question of plant patents, the advisability of endeavoring to protect the originators of new fruits. A committee, consisting of President Lyon, Prof. Tracy, Prof. Bailey and Secretary Garfield, was appointed to consider the matter, and report at some future meeting.

The leading grapes for market prove to be Worden, Concord and Moore, with much promise for Early Victor, Ulster and one or two others. Prof. Bailey thought that resistance to mildew is fully as important as hardiness. Even hardy sorts winter-kill when injured by mildew. He said that the sulphur and other remedies which are used for mildew in France are not likely to prove satisfactory here, as our mildew is not the same as the European oidum. Delaware is going out of date on account of mildew.

Prof. Cook recommended the brand of pyrethrum known as buhach above ordinary sorts as an insecticide. For application to trees with a fountain pump a tablespoonful is mixed with a pail of water.

Prof. Tracy gave his experience concerning cucumbers. For general purposes it pays to plant in the open ground. Plant in drills and the losses from bugs will not be felt. Of all vegetables it is most important that cucumbers be fresh when eaten. Soaking in water will usually remove bitterness. Pick early in the morning. Do not turn over the leaves. Always pick clean.

Wednesday evening a number of Prof. Bailey's students from the Agricultural College presented the results of their work in horticulture. One reported upon the effects of chemicals in hastening germination; another upon experiments with various stocks for grafting; another upon pea trellises where wire was found to be cheaper than brush; another upon the effects of last winter upon fruit and ornamental trees, and others upon a successful fire hot-bed, upon the botany of raspberries and blackberries, and upon points in landscape gardening. ILEX.

Miscellaneous.

FARM WISDOM IN SHORT, PITHY PARAGRAPHS.

KINDNESS to all around you is the cornerstone of happy farm life, and pays in every way.

The farmer who makes it a rule to hurry his work for the sake of getting through in time for an hour's play spell in the evening, will drive a poor horse, carry a lean purse, and most likely a heavy mortgage too.

The best calculating a farmer can do as to time, is to so plan his work as always to have enough to do, and never to be overdriven.

The farmer should realize that farming has not yet reached perfection; that improvements are possible in a thousand things: and his constant study and careful observation should be to discover the better plan.

The farmer's motto should be, "Learn something new every day." Never rest satisfied with hearsay, but find out for yourself. Experiments poorly tried are like wet weather in haying; and to rely altogether on hearsay is like frost in June.

Make all your experiments fairly, faithfully and effectually; measure and weigh with exactness, and keep a true account of all the details. Let your experiments be on a scale so small as not to injure you in case of failure.

Get your ground in good order, and plant and sow good seed in good season, and faithfully attend to all after requirements of the crop, and never mind the moon.

It is better to make two small loads and go twice, than to take all at one load and break down.

Avoid extremes, and always seek that happy medium in which the least outlay shall bring the greatest proportionate returns. Avoid law-suits and quarreling with neighbors. Mind your own affairs more, and your neighbors' less. Quarrels are like bad weeds in the garden, and law-suits like a drought.

Have a careful eye on fences, gates, and barn doors, and attend to all such things as soon as you see they need it. Have as good and convenient a place for your cattle to drink at as is possible.

Accustom yourself to habits of regularity and method. Be regular in all things. Have regular hours for rising, for meals, for feeding, and generally be as regular as you can in all things.

When away from home keep your eyes open to see how much other farmers may be in advance or in the rear of you in matters pertaining to farming.

When tired rest; when thirsty drink, and treat your horse in these respects as you treat yourself.

Be sure that your calculations are not larger than your means or your strength, for less well done, is better than more poorly done.

Labor with your mind as well as your hands, and do not over-tax either, for to be successful you will need both.

Have a place for your tools, and have your tools in their place.

Keep good tools, and keep them in good order, for poor tools make hard work, which is unprofitable.

Cleanliness is a promoter of health and good morals.

Clean stables and bedding help to make horses sleek and cattle look well.

I have never known the farmer who did his work neatly and in good season, visited by constables or burdened with a mortgage.

Slovenly farming tends to draw a farmer down hill, and slovenly harvesting is to be unthankful for what did grow. Slovenly hands in the field are like rats in the wheat bin. The farmer who does his work neatly will find it less difficult to pay heavy, than the sloven will to pay light taxes.

The farmer who keeps good fences is likely to prosper, live at peace with his neighbors and have something to give to the poor; but the farmer who keeps poor fences will have his crops destroyed, have quarrels and law-suits and nothing, except harsh words, to give to anybody.

A man may so improve his farm as to lose it.

A farmer who doesn't exercise sound judgment is like a ship at sea without a rudder.

First improve upon what you already know, and learn as much more as you can.

You may read pithy sayings all day and admire them in the evening, but your work will not be done unless you "lay your shoulder to the wheel" and push. There is no helping those who will not take counsel and help themselves.

To have many bad neighbors is a sign you should reform.

To hurry and flurry to get our work done shows much wind in the garret, but little brains.

The man who cannot learn from his neighbors' mistakes, will teach his neighbors by his own.

To have more stock than we have pasture for, is to save a spoonful and lose a shovelful.

To pasture our meadows in Spring is to borrow hay of Winter.

What is not worth taking pains with is not worth a place on the farm.

The farmer who is often caught in bed by the sun
Will see his neighbors have money while he has none.

Buy what you can pay for, if you need it, and stop there.

Show me where lives the farmer who makes it a rule to borrow tools, and I will show you broken gates, lousy calves and dirty stables.

The wagon that stands out over Winter is drawn by poor horses.

The man who cannot get the lice off his calves thinks of going West. He thinks he knows all about farming.

Pigs that are well fed, and have a warm and dry bed, are a good breed.

When anything is ready to be done and you can do it, then is the time to do it. The best time to do a thing comes only once.

Never calculate on a mild Winter because you are short of feed.

Never enter into partnership with, or leave your business in the hands of an "unlucky" man, for by reason of his careless habits you might suffer loss. He who cannot manage his own affairs is not fit to manage yours.

Details are the nails that hold the house together, and if neglected the house will go to pieces.

System is the groundwork of success, and the soul of good planning.

You may vote without talking politics, and you can be pious without long arguments on religion.

A pig is a pig, put him where you will; even in the parlor he'd be a pig still

In Summer prepare for Winter, and in Winter prepare for Summer.

Always do what you can first, and leave the rest to Providence.

Keep your eyes and ears open and your mouth shut.

Remember that that which costs the least is not always the cheapest; nor that which costs the most always the best.

Treat your hired help with respect, feed them well, pay them well. If you cannot do so, keep none. DANIEL RUPERT.

Crawford Co., Pa.

MORALITY AND TRADE.

GEN. CASSIUS M. CLAY.

RELIGIOUS SYSTEMS AND THEIR INFLUENCE.

MORALITY may be defined as the science or art of human happiness. Religion is not the basis of morality; but it may be an aid or motive power. The first religions of the race were polytheistic, when great objects and qualities in Nature were held and worshipped as gods. Polytheism then was the germ which ripened into a higher unity and philosophy of pantheism of the unity of the creative power—of the two forms one holding to theism, and the other to nature. In theism the divisions of polytheism continued, but in a vastly diminished number. Each sect held to one god, but by individualizing him, he was not the same. True theism nevertheless exists in the thought of the highest mental structures, whilst it may for all practical purposes be held the same as Nature. Religions sects have under the theistic idea been as numerous as those original polytheism produced, and the consequences have been the same; not the unity of the human race, but its severence. These systems have but little influenced morality—the science of human happiness. No one, therefore, need be alarmed at the decay of religious creeds, which have never advanced morality, and therefore cannot obstruct its progress. The higher theism is stronger today than in any former age, and morals being based upon eternal laws, just as physics, have now full vent for surer and more permanent establishment. With these postulates we are prepared to consider

MORALITY AND TRADE.

The greatest summary of moral duty in trade, as in all our acts concerning others, is contained in the Christian aphorism, "Love thy neighbor as thyself:" or "Do unto others as you would have others to do unto you." Trade may be said to be the exchange of commodities and values. The violation of the golden rule is most frequent in

FRAUDS OF APPEARANCE.

If the conductor of the RURAL should send out a specimen copy to induce subscriptions, and then after receiving the money asked, should continue a very inferior publication, that would be a fraud. So the farmer who should sell fruit by sample, and fill the hill with inferior fruit, would commit a fraud; and similar action on the part of the merchant or trader would be fraud. But when the parties trading are all present and have the means of examining the commodity exchanged, a similar fraud may be perpetrated; for if the fruit vender should put the best fruit on the top of the fruit basket, inducing the belief that the whole mass was equal; or if the merchant should sell sized cloth for real thick goods, or should show the first good yard of a bolt of goods, the others being faulty, it would be equally a fraud, though the vender should make no statement about the qualities of the fruit or the merchandise.

If the commodity is defective, it makes no difference whether it is falsely conceived by the buyer, or falsely represented by the seller, by word or device, it is, all the same, a fraud. The legal distinction of fraud, must come short of the moral; but both agree as far as they go on the same road.

PRICE.

When there is no concealed defect in the commodity, is it worth all it will bring? Not always. As a general rule it is; but there are exceptions:—Suppose I sell gun-powder which is high because of an existing war, and I have heard of the peace, and the buyer who expects to sell to the army has not been informed of the cessation of arms: in law I may charge war prices, but not in morals. I should first tell the buyer of the peace, and then sell. When all the events which make price, and all the investment of money, mind, labor, etc. entering into the product, are known, then the thing is worth all it will bring. For a thing is more valuable to one man than to another, of which the buyer only can judge, else there would be no such thing as trade.

ADULTERATION AND IMITATIONS.

Having fixed the idea of frauds, we come to consider some of the most common instances. A very common fraud is the adulteration of products: the mixture of a cheaply grown seed with others more valuable, as seed of weeds with clover, or any other prime seed; cabbage seed with mustard, rye or chicory with ground coffee, etc. So adulteration runs through all the materia medica, all the commercial eatables, as glucose or corn sugar in cane sugars; pebbles in coffee; deleterious coloring in teas; water in milk; log-wood in port; cider champagne; terra alba in flour, etc. So vicious mixtures are sold for vinegar, and wines and brandies; oils and oleomargarine made of filthy beef tallow for butter, etc. The adulteration and fraudulent imitations are bad enough; but what shall we say of the poisons which are used without stint in these infernal frauds of trade? Not only should fine, imprisonment and exile, but death be summarily inflicted upon these destroyers not only of the happiness, but of the lives of the human family.

FRAUDS OF LIVE STOCK BREEDERS.

The fraud here most common is selling one breed under the name of another, or the same breed under the record of false parentage, or claims of qualities which do not exist, as speed, size, weight of carcass, wool, health, and all that. But the greatest fraud under the present enlightenment of the laws of species and breeding, is the humbug of *new* breeds made by some Solomon, within his own short life and brain, wiser than all the lives and all the brains of all the ages! Some of the lesser accomplishments of these shams are prints of animals not taken from life, but made by rule and line to suit the ideal fancy of the times.

All animals should be photographed from life, and be presented by honest artists just as they are.

SHAMS OF SEEDSMEN AND OTHERS.

The shams of seedsmen run mostly into early varieties of plants. If all our fruits and vegetables are to be eaten only in early Spring, what are we to do in Summer, Fall, and Winter? Then there is the new-variety sham. The potato! The earliest variety of this fine vegetable that I remember is the Neshannock; every year since some spirited seedsman has been bringing forth some new potato; and now at last the old Neshannock is the finest flavored of all! So of the grape. I began with the Catawba, have run through most of the modern varieties, coming down to my last fruit age, the Lady, and the Catawba is the best table and wine grape after all. What strains upon the constitution of the moral sense! We have potatoes that will produce so much to the acre, which will not rot in the hill or in the cellar, which well stand wet and cold and drought, will not mildew, or even be eaten by bugs or beetles! Then we have the log-of-wood muskmelon and the carved seed and scale rind watermelon, and the seven-eared corn, and the plums which the curculio will not bite; then the wheat that came from the one-thousand-year-old mummy, and the tobacco which was born of a single, unknown plant; and the Shanghai chickens, because they are big; and the Bantams, because they are little! Some won't lay and some won't sit! and so on. What shall we say of silos and ensilage, commercial manure, silk and mulberries, ducks and geese, pea fowls and Guinea hens, tea and coffee raising, sorghum and beet sugar, and all that? What of Angora goats and Shetland ponies; of Poland-China hogs, of Red Berkshires and Duroc-Jerseys; of Short-horns and Long-horns, of Jerseys, Devons, Ayrshires and Herefords, and all cattle with horns and all without horns? What of South Downs and Oxford Downs and Shropshires, and long-wools and short-wools and middle-wools and fine-wools? I say, look out! there's humbug somewhere. Very slightly helpful; be slow to touch; "try all things, hold fast what is good" on a small scale! Go with D. Crockett, "Be sure you are right and then go ahead.

White Hall, Ky.

CATALOGUES, ETC., RECEIVED.

LOUISIANA AGRICULTURE.—BIENNIAL REPORT OF THE STATE COMMISSIONER OF AGRICULTURE.—A very encouraging pamphlet. Too little has been told about the real state of agriculture in the South. It is a section blessed with a bountiful soil and climate, and cursed with a degraded labor and a set of decayed traditions. Immigrants have been unable to find the happy medium between the blessing and the curse. Such pamphlets as this will be useful in pointing out the real resources of the State and her most crying needs. The four great staple crops in Louisiana agriculture are cotton, sugar, rice and corn. The cotton crop averages about 500,000 bales, of which some 65 per cent. is produced by negro labor. Some 200,000 hogsheads of sugar are produced, with 40,000,000 pounds of rice, and 12,000,000 bushels of corn. The raising of fruits and vegetables for the Northern market is a somewhat modern industry that proves fairly remunerative. There are splendid sheep ranges in this State, but the great droves of worthless dogs paralyze the industry. But little fertilizer is used, except in the gardens and small farms near the cities. Cotton seed and cotton-seed meal are used in the drill or put around the plant after it breaks the ground. Jersey and Holland cattle and their grades are highly esteemed as dairy animals, and Devons and Short-horns are valued for beef and oxen. Louisiana is an excellent stock country, and after passing through the dangers of "acclimation," all improved breeds do well. Most of the deaths of horned cattle are due to exposure and insufficient feed. One correspondent puts it well when he says that most cattle die of hollow-horn or hollow-tail, and the cause lies directly between these two extremes, viz: hollow belly. In the back counties very few improved implements are in use. Plenty of laborers still cut hay with hoes and cultivate with a stick. There are, in the State, 17,584,600 acres of forest lands, containing all kinds of timber known to the Gulf States. The United States Government owns about 2,000,000 acres in the State, while the marsh and swamp lands, 5,193,767 acres, are in the hands of the State Government. The pamphlet can be obtained from Hon. T. J. Bird, Baton Rouge, La.

SALT SAYINGS.—Pamphlet from E. S. Fitch, manufacturer of Fertilizing Salt, Bay City, Michigan.—An interesting pamphlet filled with quotations from various authorities as to the value of salt as a fertilizer. This fertilizer salt differs from the ordinary article in the fact that it contains small amounts of potash, lime and iron, so that it is a richer fertilizer than common salt. Some excellent results have been obtained from the use of this fertilizer, the most notable being its effects upon grass or wheat crops. With wheat, not only has the straw been rendered larger and stiffer, but the heads and grain have been improved perceptibly. The use of this material is increasing, and the farmer who aims to inform himself regarding the more intricate processes of his business, should by all means send for this pamphlet and study it. The use of salt in agriculture dates from the earliest times, yet its proper place as a fertilizer is perhaps as little understood as is that of any fertilizing element. A small amount is beneficial, particularly upon certain crops and certain soils. A large quantity is worse than useless—it is harmful. Just the proportions and conditions necessary to produce best results have never been exactly determined, and the study of the matter will prove both interesting and useful, leading to a better understanding of the value and behavior of other elements of fertilization. It is generally believed that the mechanical effects of salt are most valuable, that it helps other elements rather than supplies needed food itself; that it pursuades rather than forces.

COMMON PLANTS AND THEIR USES.—A chart compiled by the class in economic botany at the Missouri State University. This class, consisting of two young women and 15 young men, have been working under the direction of Prof. S. M. Tracy. In fact, the chart is really an epitome of the lectures delivered before the class. The work has been well done, and the chart is well placed as a bulletin from the Agricultural College. If we mistake not it will be found fully as valuable as any of the previous bulletins. The chart gives the order, botanical and common names of each plant, where found, whether used for food drink or fiber and the quality of its timber etc. Over 200 plants are thus treated, and the amount of information that is concentrated upon this space is surprising. The design is an excellent one, most admirably executed.

BLACKWOOD.—Circular descriptive of this fine stallion which will make the season at the stables of H. R. T. Coffin, Glen's Falls, N. Y.—Blackwood is by Alexander's Norman. He is half brother of Lulu, 2:15, and May Queen, 2:20. He has a record of 2:31 as a three-year-old. Among other fine colts he has sired Rosewood, 2:27 at five years, Blackwood Jr. 2:22¼ at five years, and Proteine, record 2:18. Blackwood is a fine horse and his colts will surely give satisfaction.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

NEVER MIND.

NEVER mind if your clothing is threadbare and worn
And the colors beginning to fade;
Such trifles are easier by far to be borne
Than the thought of a bill to be paid;
For debt is a master relentless and grim,
He grants you no rest or repose;
If once you are sold into bondage to him,
No pencil can picture your woes.

Never mind if your neighbors wonder and guess
Over things you don't choose to make known;
Your motives and actions would trouble them less
If they would attend to their own.
There's naught to require one to make his affairs
Of neighborhood gossip the theme;
If a man breaks no laws, what he eats, drinks and wears,
Is his own special business, 'twould seem.

Never mind, let the world move along as it will,
Life's changes are certain we know;
And the man that's to-day at the top of the hill
May soon grope in the valley below.
Live rightly, and slander and gossip will fail
To harm you, and soon you will find
That the very best armor whene'er they assail
Is to say from the heart: "Never mind!"

Palmer (Mass.) Journal.

OF INTEREST TO WOMEN.

MILLINERS are reviving rosettes of narrow ribbon loops. Low-crowned toques are trimmed with a mass of them in front.

Says Good-Housekeeping: "Women were patterned by nature to be housekeepers, and good ones. Let them vote, if they will, let them go into professional life and the labors that were once monopolized by men, let them do what they will, they are yet physically, morally, and feelingly best fitted to reign as Queen of the House."

Fuller's advice may be commended to all good women: "A good wife is none of our dainty dames, who love to appear in a variety of suits every day new; as if a good gown, like a stratagem in war, were to be used but once. But our good wife sets up a sail according to the reel of her husband's estate; and if of high parentage, she doth not so remember what she was by birth that she forgets what she is by match."

The young women composing a majority of the graduating class from the high school at Vincennes, Ind., have rendered themselves conspicuous, in a somewhat unpleasant way. They have "struck," and refuse to attend commencement, because a colored girl who has passed the required examination with great credit is, or was to gradnate with them. A similar unpleasantness in the high school at Paterson, N. J., a few years ago, was promptly crushed, the public showing their sentiment at commencement by applauding the colored graduate so vigorously that she could scarce read her essay, and loading her with flowers, while the remainder of the class received the most luke-warm of receptions.

A square or angular looking parlor is often improved by pulling out the piano from the wall, and placing it "catty-cornered," as children say. In English drawing rooms an upright piano is often put this way; the back being towards the room, is usually decorated. This gives scope for much ingenuity. A popular style is to hang curtains from a rod at the top, and then place flat Makart bouquets of grass and peacock feathers against the curtains.

If we would be happy, we should return to

"That time the sturdy English middle class
Was not so fine as now;
Daughters and wives would wear a last year's gown
Without a fume, because the gay beau monde,
Had slashed its sleeves and clipped an inch of skirt.
And housewives clung to old receipts, old ways
Of ordering this and that, their mothers taught;
And most of all, eschewed the petty tricks
Of show to make the little seem the much."

WHAT'S YOUR OBJECT?

THIS heading looks rather abrupt and uncompromising in cold print. Perhaps it would seem better if we called it "Advice to Young Women," only it isn't. We do not offer advice; we want to ask a few pertinent questions. Tell me, maiden with a new diploma and a new graduating gown, have you any clearly defined object in life? That "object in life"—what a bugbear it is to the foolish virgins! To echo the query of a famous or rather infamous rascal, "What are you going to do about it?" Shall you sit down in golden dreams until the fairy prince comes galloping along? Small doubt of the object then; the prince holds out his hand, the dreamer mounts behind him, and off they go into "that new world that is the old." But if the prince never comes! He always did in the old tales, but, alas! we don't live in the Golden Age now; "this is an unjust world, and virtue is triumphant only in theatrical performances." If the prince never comes! Then we only have a web of gossamer fancies, "trifles light as air," to protect us from the storms of this work-a-day world. The years we should have spent in gathering strength and imparting it to others all gone in idle dreams; all the dignity of mature womanhood unripened; all the crudities of girlhood in full bloom. Truly, our last state is worse than our first.

Not that a girl needs blame for all her innocent dreams and fancies about the prince who will some day seek her. It is a part of her very womanliness. But she need not fold her hands and let those dreams take full possession of her. And the very qualities that make her a worthy helpmate will make her a happy and useful woman—if her prince does not come.

Here let me make an heretical remark in a stage whisper. Said a clever girl: "Oh, yes! I know I'm bright, but I try not to 'give it away,' as my small brother says. A reputation for cleverness is such a handicap on one's matrimonial chances."

Now, according to general opinion, the remark quoted contains some truth; but, dear girls, a man who regards a girl as undesirable matrimonially because she is well dowered with intellect is, to say the least, unwise in his generation. But any man is right to view with indifference a woman like the cultured heroine of a popular poem who

"Knew the reasons of things—
Why the Indians wore rings
In their red, aboriginal noses,"

but who, according to her veracious chronicler, "didn't know chicken from turkey."

"A perfect woman nobly planned" is one who turns her ripened intellect to the best interests of home life, and who, should her fairy prince tarry or never come, will so order her life work that the title of old maid becomes to her a very crown of blessing.

WOMEN'S WORK.

WHAT a blessing it is upon America's daughters that there is a department in papers devoted especially to women. Here are topics of almost every description that is of an edifying and instructive nature freely discussed. Almost every RURAL contains some useful information, or some hint that will help the housewife in her daily routine of labor to perform her duties in a better way. And at the same time the literature within its pages awakens the heart to a higher action and inspires us with zeal to look ever onward and upward; for if we do not press onward with this active world, we shall be left behind in utter darkness. As we read over the lives of the truly great men and women, we see that they did not sit with folded hands, but like the scriptural lesson, "What-so-ever thy hand findeth to do, do with thy might," they went to work, and work indeed they did, to achieve what they have. So it is for us, no matter in what sphere we may live or what may be our vocation in life, the object should be to excel. Excel not by crowding others down, but by elevating ourselves to that high standard in using the advantages offered by others.

It should be our greatest theme in life to be something and to do something that will be to the advancement of society, that this people will not go backward. There is much in this wide world for each and every one to do, and if prepared to do this work, it seems no great task. We should, then, influence the young to a higher and nobler work. It should be instilled into their minds in infancy, then, when they have ripened into early manhood and womanhood, it will be no difficult task to do the duties of life in the best possible manner.

MARY D. THOMAS.

MIDSUMMER FASHIONS.

As the season advances we see few changes in the prevailing modes, save that some of the more startling eccentricities are a little modified. We are told that hat and bonnet crowns are to be lower and altogether more modest in their dimensions, a fact which appears to be flatly contradicted at every concert or promenade. At present one meets everywhere multitudes of hats whereof the model appears to have been a Gainsborough for the brim and Mother Goose's sugar-loaf chapeau for the crown—a startling headgear, only bearable above a pretty face. But, as the French novelist says, all young women are pretty. Styles in gowns are but little altered; the fancy is still for simplicity in trimmings, with heavy artistic folds for drapery. Not that this seeming simplicity implies inexpensiveness by any means.

Etamine, or canvas cloth, plain, striped and embroidered, is still in favor, but I fancy it is on the wane, as many New York houses are selling it off at greatly reduced rates. It is very handsome, particularly when embroidered or woven in lace stripes, and it drapes beautifully, but it is very difficult to make up, as it frays dreadfully, and is as hard on thread and fingers as wire netting. Albatross cloth, something like a finely finished nun's veiling, is very nice for woolen summer gowns.

The crinkled seersuckers seem to grow prettier as the season advances; they are very effective with dark velvet trimmings. A pretty gown of this material was pale blue and white stripes; the basque had collar, cuffs and revers of black velvet with vest and skirt trimmings of white embroidery. Cream and brown stripes trimmed with brown velvet would be very effective.

Among white frocks, a very pretty one for seaside or mountain wear is of cream-white albatross cloth, with pleated drapery of white wool lace. In thin white fabrics, the choice is of infinite variety. A white frock is always pretty, be it ever so simple, and now it is equally inexpensive. Piqué or Victoria lawn should not be chosen, however, for it cannot be depended on in washing. India lawn is reasonable in price, and washes as well as mull or organdy—it is always fine and smooth in texture. Nainsook embroidery is the best trimming for general wear, but except for very fine occasions a white frock should always be simple in make—that is one of its special charms.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

PATTERN FOR LACE.

CAST on 33 stitches, and knit across plain.

FIRST ROW.—(a) Slip one, knit one, thread over twice, purl two together, knit five, thread over three times, purl three together, knit two, thread over twice, purl two together (a), knit four (b), purl one, thread over, purl two together, thread over, purl two together, thread over, purl two together, thread over, purl two together, thread over, purl two together, thread over, purl last two separately (b).

SECOND ROW.—Slip one, knit seventeen (c), thread over twice, purl two together, knit one, narrow, make three stitches alternately plain and purled in loop formed in preceding row by casting thread over three times, knit five, thread over twice, purl two together, knit two (c).

THIRD ROW (d)—Slip one, knit one, thread over twice, purl two together, knit ten, thread over twice, purl two together (d), knit five, repeat from (b) to (b) first row.

FOURTH ROW.—Slip one, knit eighteen (e),

When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

thread over twice, purl two together, knit five, thread over three times, purl three together, knit two, thread over twice, purl two together, knit two (e).

FIFTH ROW.—(f) Slip one, knit one, thread over twice, purl two together, knit one, narrow, make three stitches alternately plain and purled in loop formed in preceding row by casting thread over three times, knit five, thread over twice, purl two together (f), knit six, repeat from (b) to (b) first row.

SIXTH ROW.—Slip one, knit nineteen (g), thread over twice, purl two together, knit ten, thread over twice, purl two together, knit two (g).

SEVENTH ROW.—Repeat from (a) to (a) first row, knit seven, repeat from (b) to (b) first row.

EIGHTH ROW.—Slip one, knit twenty, repeat from (c) to (c) second row.

NINTH ROW.—Repeat from (d) to (d) third row, knit eight, repeat from (b) to (b) first row.

TENTH ROW.—Slip one, knit fourteen, narrow, thread over twice, narrow, knit three, repeat from (c) to (e) second row.

ELEVENTH ROW.—Repeat from (f) to (f) fifth row, knit four, knit one and purl one in double loop of preceding row, knit three, repeat from (b) to (b) first row.

TWELFTH ROW.—Slip one, knit thirteen, narrow, thread over twice, narrow, narrow, thread over twice, narrow, knit one, repeat from (g) to (g) sixth row.

THIRTEENTH ROW.—Repeat from (a) to (a) first row, knit two, knit one and purl one in double loop, knit two, knit one and purl one in double loop, knit two, purl thirteen.

FOURTEENTH ROW.—(h) Slip one, knit one, thread over, narrow, thread over, narrow, thread over, narrow, thread over, narrow, thread over, narrow, thread over, narrow (h), knit two, narrow, thread over twice, narrow, knit three, repeat from (c) to (c) second row.

FIFTEENTH ROW.—Repeat from (d) to (d) third row, knit four, knit one and purl one in double loop, knit three, purl twelve, purl two together.

SIXTEENTH ROW.—Repeat from (h) to (h) fourteenth row, knit eight, repeat from (e) to (e) fourth row.

SEVENTEENTH ROW.—Repeat from (f) to (f) fifth row, knit eight, purl twelve, purl two together.

EIGHTEENTH ROW.—Repeat from (h) to (h) fourteenth row, knit seven, repeat from (g) to (g) sixth row.

NINETEENTH ROW.—Repeat from (a) to (a) first row, knit seven, purl twelve, purl two together.

TWENTIETH ROW.—Repeat from (h) to (h) fourteenth row, knit six, repeat from (c) to (e) second row.

TWENTY-FIRST ROW.—Repeat from (d) to (d) third row, knit six, purl twelve, purl two together.

TWENTY-SECOND ROW.—Repeat from (h) to (h) fourteenth row, knit five, repeat from (e) to (e) fourth row.

TWENTY-THIRD ROW.—Repeat from (f) to (f) fifth row, knit five, purl twelve, purl two together.

TWENTY-FOURTH ROW.—Repeat from (h) to (h) fourteenth row, knit four, repeat from (g) to (g) sixth row.

TWENTY-FIFTH ROW.—Repeat from (a) to (a) first row, knit four, purl twelve, purl two together.

TWENTY-SIXTH ROW.—Slip one, knit sixteen, repeat from (e) to (e) second row.

Repeat the scallop from beginning. It will be seen that the inserting which serves as a heading begins to repeat at the third row. It is, in fact, distinct from the edge, and may be made separately if desired by following directions from (a) to (a), (c) to (c), (d) to (d), (e) to (e), (f) to (f) and (g) to (g). DAISY.

KITCHEN TALKS.

ANNIE L. JACK.

THE old saying that "One sickly sheep infects the flock" was verified in our home this Spring when the Student came home ill with a fever that slowly but surely caught in its grasp one after another of the family group. Some escaped with a slight touch of the disease; others were some time ill, all depending upon the condition of the blood. Trying hard to reach the source of the trouble by inquiry, I ascertained that the college procured its supply of drinking water from a neighboring well, into which ran a great deal of surface water, and it was thought the slops from the kitchen contaminated it when rains came.

There were no bath or other appliances for bathing, except the wash bowl, and to boys accustomed to a regular "tub night" this was enough to cause sickness, and the result was that our boy came home ill, and communicated the dire fever to brothers and sisters. I thought, as the subject was thus presented to me, that we cannot be too careful as to the institutions where our children are placed, not only for mental and moral, but for physical reasons. Good health is of first importance to success in anything, and should be attended to in all institutions of learning. As a consequence of neglect in this respect our whole family have suffered, and doubtless many others in the same way. Children of ordinarly cleanly habits accustomed to bathe freely, and to eat and drink what is pure and fresh, are more likely to contract disease than those who know no change from their usual habits.

Just now in our home the roses are blossoming, myriads of flowers are to be seen from the kitchen door—and all nature is beautiful. The birds sing their very sweetest in early morning—it is a song of hope and love with which they talk to each other in the brooding time. The kitchen has on its Summer aspect, everything being with a view to coolness and comfort there. It is a season of rapid transitions, more than I ever remember seeing. Hardly had the blossomed trees faded their pink and white wreaths when some one says, suddenly, "How large the crab apples are;" and the strawberry bed hardly loses its whiteness when a little hand brings proudly into "mother" the first ripe berry. Ah! these little hands, our dearest earthly treasures, how soon they learn the beauty of self-denial! I often watch a child's face in giving, its sweet delight innocently shown, a living confirmation of that beautiful sentence, "It is more blessed to give than to receive."

POTATO BEATER.

As I have often intimated, I like a fork best for "mashing" or breaking up potatoes; but while visiting a friend, a short time ago, I saw her using an implement that was even better than a fork, especially where one has quite a large quantity to prepare. It was made of very coarse wire and bent into finger-shaped loops, with the two ends of the wire twisted together and fastened into a wooden handle. Almost anyone in a family could

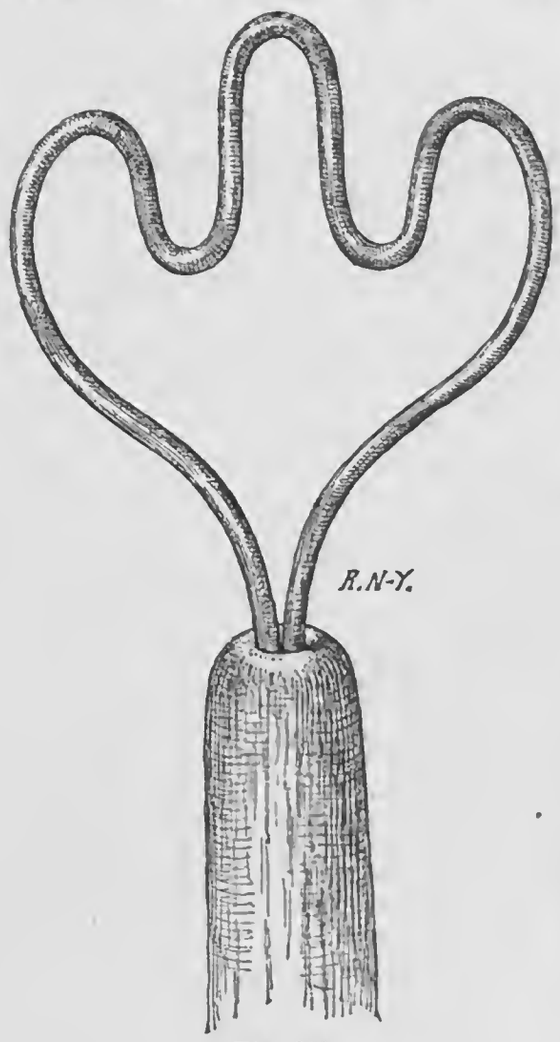

Fig. 279.

make the implement, and the cook would appreciate the convenient little article.

MAY MAPLE.

WHAT TO EAT.

The Housekeeper says: "So perfectly ignorant are people generally of the laws of nature that they give their pigs the food which their children need to develop muscle and brain, and give their children what their pigs need to develop fat. For example, the farmer separates from milk the muscle-making and brain-feeding nitrates and phosphates, and gives them to his pigs in the form of butter-milk, while the fattening carbonates he gives to his children in butter. He sifts out the bran and outer crust from the wheat, which contain the nitrates and phosphates, and gives them also to his pigs and cattle, while the fine flour containing little else than heating carbonates he gives to his children. Cheese which contains the concentrated nutriment of milk is seldom seen on our tables, while butter, which contains not a particle of food for brain or muscle, is on our table at all times of day."

So, then, we should eat Graham, corn-meal, oat-meal, barley, cracked wheat, wheatlet, and for many people who feel the lack of suppleness and general ease of movement, the Southern grains, containing much less lime than the Northern ones, as rice, tapioca and sago, are preferable, with plenty of vegetables and fruit acids. More rice, as a rule, would help our bill-of-fare, because it is easily digested.

Next in value we would place eggs—plenty of eggs—nothing is better for a brain food. Why? A certain physician cured a case of insanity by giving 16 eggs daily. Fresh fish, oysters and clams, if fresh, are good. A little salt fish is allowable, although the principal benefit derived from codfish is on account of the milk and cream we prepare it with. Vegetables and fruits are all good and should invariably form a part of every meal. Beans are excellent eating, and should be found often upon our tables. Comparing their nutritive value with that of buckwheat, which enters largely into the winter diet of many families, it will be found that beans have two-and-one-half times more muscle-forming elements and only about two-thirds as much sugar and starch: while the phosphates are as four to one, and the time of digestion is about one-half hour less.

Use sweet cream with mush and simple desserts of rice, plain puddings, baked apples and the like. Housekeepers do not hesitate to dip out two cups of sour cream any time for baking cake, but sweet cream, O, my! Milk makes an excellent basis for supper, to be eaten with bread or mush of some sort. The natural food of an infant contains no starch, but usually the first solid food given to babies is made up of little else but starch. Give the little ones nice fresh Graham, bean porridge, mush, meat broth and such like food. Brown bread and beef contain very nearly the same food elements, which is a strong argument for vegetarians: but if we must have meat twice or three times a week let it be beef, mutton, veal, lamb, or at least chicken. As to what we must not eat, first and foremost, pork. It requires five hours and a quarter for digestion—longer than the usual interval between meals. Perhaps some families can thrive upon pork, but we know many that can not, and we have tried and proven that farmers' families can live without even keeping a pig.

Then we should forbid fried cakes, cookies, cake, pie and rich pudding. It seems cruel to have these things on our tables and refuse them to the children, and if they are in the house, children are sure to have them. There seems to be no good reason why potatoes should enter so largely into our daily bill-of-fare. Pickles also should be tabooed, especially for supper. A physician of note says of mustard and horseradish: "I never put anything into my stomach which would draw a blister upon the outside." As for drinks, there are milk, butter-milk, water, lemonade, crust coffee, chocolate and many simple preparations which have not the ill effects of coffee and tea. But some farmer folk will say, "We cannot afford to buy wholesome foods; we must eat what we raise; to be sure, pork and buckwheat don't agree with us very well, but we are in debt and must practice economy." Be assured, we cannot afford to live below the very highest physical condition attainable by us. This is the very best economy—nothing but religion pays better. ZENA.

FOR THE DESSERT.

A NICE little dish for dessert:—Butter and cut in half a slice of fresh bread for each dish required; mash fresh, ripe currants with plenty of sugar and cold water sufficient to form a sirup; place one half slice of the bread on the dessert plate, dip over it liberally of the prepared currants, place the other piece of bread on top, and cover well with the currants.

MARBLE CUSTARD PUDDING.

Cover the bottom of a pudding basin with slices of stale cake (best of dark colored), add a light layer of raisins, and for each pint of milk allow one egg beaten with sugar and a little salt; stir this into the milk, using whatever flavoring desired. About two tablespoonfuls of sugar and two or three handfuls of raisins to three pints of milk, and either nutmeg, lemon or wintergreen is nice for flavoring. Quickly put the pudding in an oven not too hot, not stirring it up at all, as the cake should remain intact on the top. Bake slowly until the custard jells, no more, or else it will whey, and custard should never do that. When done, set it in a cool place, and when the steam has partially escaped, cover the dish. Serve cold, dipping out carefully and turning each spoonful bottom upwards. GLADDYS WAYNE.

LEMON MINCEMEAT.

Peel the rind very thinly from three lemons, being careful to take up none of the white skin. Put the rind into a saucepan with a little water and stew until it is so tender that you can mash it into a paste. Pare, core and chop eight large, tart apples, free from skin and fibers, and chop fine a half pound of suet, cut small one ounce each of candied citron and lemon, and squeeze and strain the juice of the three lemons. Mix all these with the paste of the lemon rind, add half a pound of brown sugar, half a grated nutmeg, a saltspoonful of powdered mace, and a wine-glassful of brandy or cider. This will improve by standing closely covered for a few days. Should it not be moist enough, add a little cider when it is to be made up into pies.

APPLE MINCEMEAT.

This is also very nice and quite different in flavor. Chop two pounds of tart apples and half a pound of suet, add one pound of currants well washed, half a pound of raisins seeded and chopped, one pound of brown sugar, the juice of four oranges and one lemon, one teaspoonful each of mace and allspice, and one gill of brandy or cider. Mix thoroughly and keep closely covered in a cool place. NETTIE.

Miscellaneous Advertising.

Vitality and Color

Are restored to weak and gray hair, by the use of Ayer's Hair Vigor. Through its cleansing and healing properties, this preparation prevents the accumulation of Dandruff, and cures all scalp diseases.

When I commenced using Ayer's Hair Vigor my hair was weak, thin, and gray. My scalp was also full of dandruff, and itched incessantly. Two bottles of the Vigor removed the dandruff, stopped the irritation, restored my hair to its original color, and so stimulated its growth that I now have an abundance of long black hair. The occasional use of this remedy keeps my hair and scalp in perfect condition.—Florence J. Cannon, 759 Clinton st., Trenton, N. J.

Ayer's Hair Vigor

is, in every respect, the most cleanly of all preparations for toilet use.

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists and Perfumers.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

HIRES' IMPROVED ROOT BEER. Packages, 25 cts. Makes 5 gallons of a delicious, sparkling and wholesome beverage. Sold by all druggists, or sent by mail on receipt of 25 cents. C. E. HIRES, 48 N. Delaware Ave., Philadelphia, Pa.

FARMERS,

Send for Circulars and Price List of The BARNES PAT. IRON FENCE, the cheapest and most durable fence in the world. Address THE BARNES PAT. IRON FENCE CO., EASTON, PA.

AHEAD OF ALL COMPETITION.

1886.

THE PHILADELPHIA

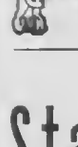
LAWN MOWER.

FOURTEEN SIZES FOR HAND USE. Weighing from 21 to 51 Pounds. THREE SIZES FOR HORSE POWER.

Graham, Emlen & Passmore,

Patentees and Manufacturers,

631 Market St., Philadelphia, Pa.



Brewster's Patent Rein Holder.

Your lines are where you put them—not under horses' feet. One agent sold 12 doz. in five days; one dealer sold six doz. in 15 days. Samples worth $1.50 FREE. Write for terms.

E. E. BREWSTER, Holly, Mich.

REMINGTON

Standard Typewriter.

Attention is called to the **increased excellence** of this **incomparable machine.** Buy it, with the **privilege of returning** it at any time within thirty days, C.O.D. for full price paid, if not **absolutely satisfactory in every respect.**

Handsome Illustrated Pamphlet on application.

News of the Week.

HOME NEWS.

SATURDAY, June 26, 1886.

ANARCHISTS are on trial at Chicago, Milwaukee and St. Paul, and boycotters in this city have been convicted....The Moulders' Union, over 100,000 strong, are pretty sure to join the K. of L.; elections in all the local unions to vote upon the measure.....The Edison dynamo and heavy electric machine shops are to be removed from this city to Schenectady, on account of the "uncertainty of labor" here, a strike in May having caused much loss to the Company. Over 300 skilled mechanics will be thrown out of employment, as only the best and faithfulest are to be taken along, the rest of the needed help to be secured in the interior and Eastern cities. Several changes of the same kind, and for a like reason, are taking place elsewhere.....A good deal of talk still, especially in Republican papers, about that Payne bribery case. New evidence of bribery said to have come to light. The Senate Judiciary Committee reported yesterday against investigating the case for lack of evidence of bribery of which Payne knew anything..... Republican and Democratic papers persist in saying there are no Mugwumps worth mentioning, yet what a tremendous amount of mentioning they give them! Is it possible there really are a considerable number of men impracticable enough to cast their votes for what they deem best, outside party lines? Are Prohibitionists Mugwumps?.....Specimen strikes: plasterers at Pittsburg and Allegheny City for eight hours; building at a standstill. Switchmen at Chicago Stock-yards for better pay and fewer hours; other workers attacked; a blockade made. The great female strike of 10,000 shirt and collar makers and washers at Troy, N. Y., after lasting four weeks and costing the strikers $620,000 in wages, has collapsed. The employers to the last refused all concessions, and all recognition of the Knights of Labor, merely promising to look into and discuss the work "girls'" grievances. All the factories opened yesterday.....Randall, protectionist, and Morrison, free-trader, the Democratic leaders of the House, are bitterly opposed on tariff legislation, and Wednesday wrangled a good deal as to the way the tariff plank on the Democratic platform of 1884 should be construed ....Same day a deadlock in the House on Morrison's motion to lay a special income tax to defray the money appropriated in all new pension bills. Republicans oppose, and leave the House without a quorum.....The President is sending a great number of vetoes to Congress, especially of pension bills—71 to yesterday.....Canada dispatches say the Dominion will have a deficit of $5,000,000 this year.....Brooklyn is profiting largely from the East River Bridge. The new city directory shows an increase of 8,827 names over last year, and an estimated population of 768,000 ....Out of 300 persons who celebrated the third anniversary of Pastor Schmitz's ministry in the German Reformed Church of Pottersville, a little hamlet on the Black River in Huntingdon County, N. J., by a picnic on Thursday week, 214 have been or are ill, and some of them are likely to die; 13 are still prostrated. It is thought some wretch poisoned the spring during the festivity..... The guard around Grant's tomb will be removed next Tuesday.....Judge Poland, of Vermont, denies that he is unfriendly to Edmunds. The general opinion among Republican factions there is to "kiss and be friends." .....Catholic Archbishop Gibbons, of Baltimore, created Cardinal June 7, received the insignia of that dignity last Sunday from two high Papal officials just arrived from Rome. .....The decree of the Cardinal Archbishop of Quebec against the Knights of Labor, prohibiting Catholics from becoming members, has been approved by the Pope. American Catholic authorities, however, think differently from the Canadian. Nothing authoritative about the Papal indorsement ... .Logan says he never said that Blaine is trying to run the politics of this country and also those of Europe, or any words to that effect.....It appears probable that there will be a very decided change in the President's policy with regard to office holding soon. Most of the sticking Republicans are likely to be shot out on July 1, or thereabouts. Democrats glad, for they get the "loaves and fishes;" Republicans not sorry, as every discharged person is sure to become a very "offensive partisan" indeed.....J. Harris Rogers, perpetrator of doggerel and inventor of the Pan-Electric Telephone, has brought suit for breach of contract against Attorney-General Garland, Senator Harris, Indian Commissioner Akins, and Ex-Congressman Casey Young, to whom he gave a big lot of stock of the company for their influence in starting it. He says they havn't pushed it as he expected, and therefore he reclaims the stock; they say they are glad of the suit as it will enable them "to get rid of Rogers;" and that it is "exceedingly absurd," and that R. is mad because they "refused to allow the country to be flooded with stock." All stick to their stock, however..... Nothing except preparation by the lawyers with regard to the Government's suit to burst up the Bell telephone, which has lately gained three suits against infringers on its patents, before the United States Courts..... .. .... Beecher sailed for England just a week ago.... .....Randall, of Pa., the anti-free-trade Democrat, to whose opposition the defeat of the Morrison tariff bill is due, is preparing a tariff bill of his own. In it the duty on wool is not lowered—Morrison had put in on the free list—neither is it raised to the figures of 1867, as desired by flock owners; but a clear distinction is made between washed and scoured wools, so as to prevent the enormous frauds that have lately been perpetrated by wealthy importers who have been bringing in scoured wools as washed, so as to pay a much lower rate of duty. Wool and worsted are put together, and there's a new classification of wool. The internal taxes on tobacco and and fruit brandy are repealed entirely, and a rebate is allowed on all unbroken packages in dealers' hands. Proposed reduction in revenue, $9,000,000.....Some postal clerks on railroads, chiefly in Ohio, Indiana and Illinois, fearing they would be discharged, have been lately trying to induce the other railroad postal clerks to form a union, and strike whenever any member should be sacked. Postmaster-General Vilas heard of the move two weeks ago, and summarily discharged 29 of the scheming clerks Thursday. Very little excuse is now needed to discharge "offensive partisans" ....All the papers just now are poking fun at Midas Hearst, of California—a splendid miner, but a parody on a Senator... The French Chamber of Deputies have appointed a committee of nine to investigate the Panama Canal before consenting to a lottery loan of 600,000,000 francs (about $120,000,000) which Lesseps says will be enough to complete it. Six are known to be against and three for it. The obligations thus far are $167,000,000 (nearly all French money), and the annual interest charge is $6,000,000. France has so much at stake in the matter already, and De Lesseps's influence is so great among French investors, that it is likely permission will be given to launch the loan, whatever the report may be. If not, the affair must collapse. Americans generally think it will either do that in any case, or require very much more money and time, or a change of plan so as to make locks along its course, instead of making it a sea-level work like the Suez Canal. Pacific Slope people are very anxious for its completion. Now, their exported grain has to go round Cape Horn: when built, it will go through the canal.....Anent ex-President Hayes' children: Webb is a trunk-maker at Cleveland, Burchard is practising law at Toledo, Rutherford is paying teller of a little savings bank at Fremont, and Fannie and Scott are at school.....The Senate has passed a bill for submission to the people of a constitutional amendment extending the term of President Cleveland to April 30, 1889, and providing that April 30 shall at that time supersede March 4 as the date of inauguration. This is to prevent the lapse of so long a time between the election of Congressmen and their entry on their duties..... ... Moses A. Dow, founder and proprietor of the Waverly Magazine, died in Charleston, Mass., Tuesday, aged 76.....The 250th anniversary of the founding of Providence, R. I., was celebrated by large processions in a heavy rain-storm Thursday.....Mayor McLean, of Vancouver, British Columbia, appeals for his people reduced to "extreme want" by the late cremation of the town. Donations sent to him will be used "where they will do the most good."..... ....The first caucus of the House Democrats was held Thursday—all wanted to go home, hence an early close of the session probable in Congress.... The bill repealing the Pre-emption and Timber Culture Laws was passed by the Senate Thursday, after providing that the "holders of military bounty land warrants, or other land warrants or other land scrip," heretofore issued, shall not be deprived of their right "to locate such warrants or scrip on the public lands of the United States," as if the act had not been passed.....Contributions to the Irish Parliamentary Fund are flowing in generously from all parts of the country; $225,000 have hitherto been remitted by the Rev. Charles Riley, Treasurer of the Irish National League of America, and many other collectors have sent more.....The annual death rate of colored people in cities, especially in the South, is much greater than that of whites. The ratio in Washington is nearly two to one, and in Savannah it is said to be 122.94 in 1,000 against 12.19 for whites, while last year the rate for children under five years is reported at 602.93 in 1,000, or over half those of that age. Are the health authorities acting fairly with the colored "man and brother" and his little ones?.....The Massachusetts House killed the Senate bill increasing the commutation on sentences of convicts for good behaviour as unconstitutional.. ..The Utah Supreme Court has decided that the Auditor and Treasurer of the Territory appointed by the late Gov. Murray were validly appointed. The Governor removed their predecessors because they paid the members of the Legislature after he had vetoed all the appropriation bills, in order to keep the hands of the "Saints" off the money bags.... ....Gov. Pennoyer's majority in Oregon has increased to 3,340—usual Republican majority, 2,000.....The Nova Scotia secession majority was 12,000, in a total vote of 60,000..... A consultation of eminent Chicago and local physicians at Bloomington, Ill., Thursday, decided that ex-Senator and ex-Judge Davis was beyond hope of recovery. He died calmly this morning after a lethargy of 12 hours.....The New York Times has sent Lieut. Frederick Schwatka, the Arctic traveller, and Prof. William Libbey, Jr., of Princeton College, to explore the Southern Coast of Alaska, and tell the public what they discover about the native races and the country..... .....During the present Congress 493 special pension bills have passed and gone to the President, and 111 more on the way—over 600 in all—nearly three times the number passed at any session since 1861. Why shouldn't the well equipped, trained and expensive Pension Bureau have charge of all the pension business?..... ..At Clinton, Ia., after a trial for breach of the Prohibition Law, a whiskey mob attacked the principal witnesses, who fired with fatal effects among the crowd. For this two of them were jailed, and Monday night a mob of about 1,500 whiskey advocates attacked the jail to lynch the prisoners. The Sheriff's posse opened fire on the rabble and after wounding four, dispersed them. Prisoners taken for safety to State Prison, at Anamosa, Tuesday morning. Several other reports of great bitterness and much violence, in various places, between the opponents and supporters of "free rum." ....A high coal syndicate is buying up and consolidating all the mines in Southern Illinois. Capital $1,500,000—small operators to be frozen out. A uniform price of coals to be fixed. The Ellsworth Coal Co., at the bottom of it; Jay Gould reported to have a large fist in the "pie." .....Over four months ago 1,500 stove moulders struck for an increase of 17 cents on the dollar, at Troy, N. Y., one of the largest stove-making centers of the country. Manufacturers, owing to keen competition, especially in the West, refused. A few days ago J. W. Hayes, of New Brunswick, N. J., of the Executive Board of the K. of L., began to arbitrate. After much trouble the manufacturers agreed to open their works on Monday at the old "board" scale of wages, and to pay the average price paid in other places. Finally, the men accepted. Over as many more stove workers were forced to be idle for over four months through the moulders' strike..... .... Benjamin Moran, late United States Minister to Portugal, and for nearly a quarter of a century Chief Secretary of the United States Legation in London, has just died in England, where he has been for some years an invalid.. ....The edition of 325,000 of Grant's work is so nearly exhausted that a new edition of 25,000 is about to be published. Webster, the publisher, has just gone to Europe to push its sale there. On his return he will give Mrs. Grant another check—probably for $250,000.. ....Stephen Kelley, a hearty veteran of this city, goes to Gettysburg every Memorial Day to decorate his own grave, the record showing he was killed and buried there..... East St. Louis is still the paradise of thieves, burglars and thugs of all stripes—nothing done by the local authorities, and Gov. Oglesby refuses to furnish militia..... The Chinese Minister is to build a one-story Mandarin Palace, costing $250,000, at Washington, for the representatives of the Flowery Kingdom.....Of the 67 police officers present at the Chicago riot when the Anarchist bomb was hurled among them, seven have died from their injuries, 16 are still unable to leave their beds, and 18 only have hitherto been able to report for duty. The doctors seem inclined to claim all the money contributed for the killed and wounded, though nearly all have been treated in hospitals and other public institutions..... The wall-paper manufacturers' pool "goes to the wall" by limitation at the end of this month, and there's little present prospect of renewing it; hence prices of all wall paper are likely to drop nearly half soon, except those of the very expensive, hand-made sorts. ....The Chesapeake and Ohio road is to be merged into the Newport News and Mississippi Valley line, extending to New Orleans and connecting with the Huntington system to San Francisco ....Rose Elizabeth Cleveland goes to Chicago to edit a literary paper.....Congress likely to adjourn by July 10.....The bill for the relief of Fitz John Porter has passed the Senate—all it now needs is the President's signature to become a law.....

FOREIGN NEWS.

SATURDAY, June 26, 1886.

PARLIAMENT was prorogued yesterday by a message from the Queen, and is to be dissolved to-day "in order to ascertain the sense of the people on the important proposal to establish a legislative body in Ireland for the management of Irish affairs as distinguished from Imperial affairs," to use the words of Her Majesty.....General elections are held here in all parts of the country on one day; in the United Kingdom some will occur every week-day from July 5 to 16, so that the result cannot be ascertained for some time. Last year the Conservatives seemed to sweep everything before them at the outset, yet they were beaten in the end. Never, in the history of the British Isles, has there been so bitter and passionate an election as the present. Gladstone appeals to justice, generosity and the "people;" his opponents to fear for the unity of the Empire, the spirit of domination and bigotry, class distinction, and the immemorial prejudices of the English and Scotch against the Irish. The heated discussions on land purchase and land tenure, and the evils of aristocracy and legislators by inheritance, are sure to sap the present system of land tenure in Great Britain and the deep-laid foundation of British aristocracy. ....Wherever Gladstone appears, he is hailed with the wildest enthusiasm by the masses, and with matchless eloquence and skill, he has placed all his opponents on the defensive. The latter are also fervidly greeted, but not by the masses. As yet it continues anybody's fight; but if enthusiasm instead of votes won the battle, the G. O. M. would be the victor.

After all, the French Senate, unable to withstand Radical pressure, gave a majority in favor of the expulsion of the "Princes." The Count of Paris has been enthusiastically received in England, where he will reside temporarily. The Queen has sent him a letter of sympathy and the nobility and people are making a martyr of him. Prince Jerome Napoleon (Plon-Plon) is in Switzerland; his son Victor, the recognized heir to what there may be for Bonapartes to inherit, is at Brussels in Belgium, where he will hold a miniature court. Many high French officials have resigned as a protest against the expulsion. All the foreign papers say it was suicidical folly for the Republic to expel the pretenders to the throne, as while in France they would be under Government supervision, abroad they will be able to plot in freedom, and have become much more conspicuous personages. It is quite possible, however, that the French Republic knows what is best for it..... There's nothing else of general European interest this week.....

AGRICULTURAL NEWS.

SATURDAY, June 26, 1886.

The clipping season has been a trifle late, but it is now about over.....A praisworthy strike—that of wool growers for better prices. .....Isn't wool-growing labor as much entitled to "protection" as wool manufacturing labor?....When before did the London wool market give the American wool market such a "lift" as this year?.....If wool manufacturers raise the wages of their hands five to 15 per cent. is it fair to take it from the wool growers by trying to bear the market? Let the consumer pay it, as he has to do in other cases.....There's a world too much glorification over the defeat of the Morrison free wool tariff bill; a change of nine votes would have passed it; but even then it would have been certainly defeated or pigeon-holed in the Senate....The rise doesn't suit the commercial papers at all—except Bradstreet's..... London bankers are said to have advanced heavily on colonial wools, and will withdraw offerings rather than allow a decline in prices. .....It is now understood that on and after July 1 the elevator charges for storing grain in Chicago will be reduced three-quarters of a cent for the first 10 days and half a cent for each additional 10 days thereafter. The charges for switching and trimming also will be abolished. The effect of the change will be a reduction of 55 per cent. in the charges for storing and handling grain during the first 10 days on an average car load of 600 bushels. This is a movement which has been very strongly urged for several years, and is regarded in the grain trade as one of the most important steps taken with respect to the future of the grain trade in that city..... The 60 days' stay granted by Sec. Lamar to the cattle barons of the Indian Territory was up Tuesday, and Monday Gov. Jones Wolfe, of the Chickasaw Nation, issued a proclamation saying the stay was a fraud on the Indians and that he will confiscate enough of the cattle to pay $1 a head to his people for pasturage during the 60 days, and drive out the others after June 24. Cattlemen are "to take their stock, pay the price asked for grass, and at once remove their cattle".....Three years ago woodchucks became so abundant and so destructive in La Porte County, Indiana, that the authorities offered a bounty of 20 cents for each woodchuck scalp. The first year 2,875 scalps were presented; the second, 5,640; the third, 7,371—a total of 15,886 scalps, on which was paid $3,177.20. Some men make a regular business of hunting woodchucks..... ..From March 1, the total packing of hogs is 2,205,000, against 2,110,000 a year ago—increase 185,000 .....Among the exports from New York last week were 1,540 live cattle, 140 live sheep and 5,820 quarters of dressed beef.....The exports of live stock and dressed meats from the port of Boston for the English markets last week were 719 cattle, 700 sheep and 2,821 quarters of beef.....Present prices of hogs in Chicago are 10 to 15 cents higher than one year ago. Cattle are about that much lower, and sheep practically unchanged. This is on an average of several weeks.....The bill of Senator Edmunds relating to the inspection of pork and bacon for export, designed to be retaliatory to France and Germany, has passed the Senate . Stock-raisers in the West are incensed at the railroads for charging full rates on stock cattle returned to the country. Formerly all feeding cattle were carried at two-thirds of the tariff rates. .....In Great Britain during the 13 weeks ending March 27th, 124 fresh outbreaks of pleuro-pneumonia were reported and 564 cattle were attacked by that disease a great increase over the corresponding period of last year, when 72 fresh outbreaks were reported and 214 cattle attacked.....The Treasury Department has rendered a decision in which it is held that the provision in the "Free List" for animals specially imported for breeding purposes only applies to such animals as are proved by evidence satisfactory to the Colector of Customs at the port of importation to especially imported for the said purpose. The breeding must be the special, and not the incidental, object of the importation. Now mules are imported "free" from Canada "for breeding purposes," and the other day a flock of 3,000 sheep were driven across the Mexican line with wool on their backs, "for breeding purposes," shorn and driven back again—the wool escaping the duty .....Lake freights from Chicago to Buffalo are on a basis of two-and-quarter cents for wheat and two cents per bushel for corn... Farmers of Great Britain much depressed over the low prices, not only for wheat, but for barley and oats.....While prices for strawberries have been universally low this season, there never was a year in which this fruit brought more money into the coun-

try.....This country now produces three-fourths of the corn grown in the world, and has averaged for five years a product of 1,619,000,000 bushels, and exported only an average of 56,000,000 bushels, or three-and-one-half per cent, and would readily have doubled the exportation without missing it.....The State Auditor of Indiana predicts that the total assessment of real estate of that State will fall $100,000,000 below that of last year, on account of the decrease in values.....

....Arrangements are in progress for that great Chicago Horse Show. All breeds will be finely represented. About $12,000 of the $20,000 in subscriptions for premiums, etc., desired by the State Board of Agriculture, have already been secured. .....More than three million of trees were planted in Nebraska on Arbor Day.....

Crops & Markets.

SATURDAY, June 26, 1886.

The Mark Lane Express, in its weekly review of the British grain trade, says: The weather has been variable. The wheat crops are fully three weeks late [Here they average fully two weeks early]. Barley and oats are also backward. Trade favored buyers. The sales of English wheat during the week were 43,176 quarters at 31s. 4d., against 38,184 quarters at 33s. 2d. during the corresponding week last year.

Connecticut never had such a fine apple crop as last year's; fine winter apples sold last Fall for 40 cents a barrel; lots rotted on the ground for want of barrels; many cellars still full. Many farmers making June cider; others using them as a fertilizer. Apple crop promises to be unusually large again this year.

The tone of the wool market has improved greatly within the last two or three weeks, owing in great part to the energy and enterprise of Western dealers in buying, and to the resolute stand taken by large growers in selling. Western action in both these respects has greatly strengthened the Eastern markets. The shortage of the clip, now acknowledged by all, has also helped; this is greatly due to the rise in the price of mutton; fair muttons brought from $5 to $6 per head in March against $2 and $2.50 in 1885. The highest estimate of the shortage is 33, and the lowest anywhere above five per cent. Since early cablegrams of London sales, Ohio has put up prices from 2 cents to 5 cents. Much excitement in Michigan and a firm advance from what is now seen to have been too low figures. Texas clip nearly all sold. Kansas wool pretty well cleared up at 18 cents to 20 cents per pound there. San Francisco markets bare of six and eight months' wools. The largest amount of wool ever offered at auction sale in this country was the 400,000 pounds lately put on sale, but partly withdrawn, at St. Louis. The great June auction sales of colonial wool in London which opened on June 16, include over 140,000,000 pounds, or 370,000 bales—350 times the St. Louis offring, more than two-fifths of the entire annual product of the United States, and more than we have ever imported in one year. For the 10 months ending April 30, we imported 113,015,213 pounds against 64,557,468 pounds for the corresponding period last year—more than double. If May and June imports are proportionate, our imports this year will be the largest on record; the 128,131,747 pounds imported in 1879 being the heaviest now on record. In the 10 months the greatest increase was in clothing wools—of which we imported 35,673,409 pounds against 8,711,118 pounds in the same time the previous year—over four times, or 400 per cent, as much. The increase in combing wools was over twice, or 200 per cent; while in carpet wools there was an increase of only 59 per cent. Hence the foreign competition has been greatest against fine-wool sheep, next against combing-wool sheep, and least against coarse-wool sheep.

Prices of wool now at the East are very firm in sympathy with the West and Europe. Since June 1, prices at the seaboard have advanced two to three cents per pound, and the advance has been greater in many parts of the interior. Some say the market can't be sustained and that purchasers will have to sell at a sacrifice; but while holders are not anxious to sell at present figures, manufacturers are ready to buy up everything. The sales at the Boston market during the week have been 4,611,000 pounds against 2,134,000 pounds last week and 2,069,000 pounds in the corresponding week last year, so that arrivals are very lively; but it is thought some lots change hands several times, being counted each time in the sum total of sales. Prices of the leading sorts have been

Ohio and Pennsylvania X	31@32c.
Ohio and Pennsylvania XX	32@33c.
Ohio and Pennsylvania XX and above	32@33c.
Michigan X	30@31c.
Fine Ohio delaine	31@32c.
No. 1 combing	31@33c.
Texas spring, 12 mos	21@21c.
Super A	31@31c.

At Philadelphia prices are two to three cents higher than on June 1. Supplies very light; receipts of new clip at least 50 per cent. less than last year. Advices from Europe show an advance in wools. There has been a gain of 20 to 25 per cent. in prices at the great London sales, and competition is extremely keen among French dealers and manufacturers.

MARKETS BY TELEGRAPH.

SATURDAY, June 26, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is ¾c. higher; No. 2 Spring, 1⅜c. higher. Corn, ⅜c. higher. Oats, ⅛c. lower. Pork, 55c. higher. St. Johnsville, Montgomery Co., New York.

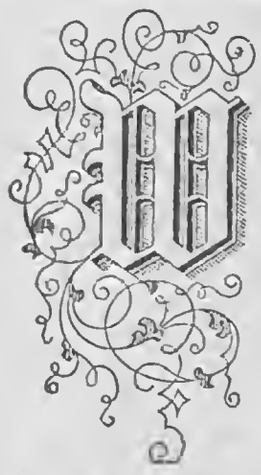
For the Young.



Elwould all like to see that little baby-King in Spain. No doubt you have all read about him. He is a King before he can talk. Gray headed men will be obliged to call him "Your Majesty" long before he can creep. There will be small chance for people to talk "baby talk" to him, and as for kissing him, that will be out of the question, unless his nurse should do it on the sly. I expect he looks about like all other babies, only he may be much weaker and smaller than many who are not one-hundredth part so famous. It is a good thing to remember that a King has to be a boy just like every other man. I have often wondered what the boyhood of a King must be. I don't believe they have half the fun that our boys have. I don't see how they can help being selfish and proud. They frequently do things for which they deserve to be whipped, but I am afraid they don't get the whipping as often as they should. I remember reading how the Prince of Wales was once whipped by his father, and I don't think the whipping ever did him any harm. We have no room for Kings in this country, at any age. Our American boys are better off than any set of Kings that ever lived. We have a chance to spread out and become masters of ourselves; that is more than any King can say.

Friendship is a wonderful thing. Every boy and every girl ought to have a good friend. Most people naturally pick out a "chum." That is a good plan. Such a friendship teaches us lessons in generosity. The selfish people are those who never knew what real friendship is, and so cannot see how pleasant it is to do things for others. There are too many selfish people in the world now. They make the very air about them sour and blue. Pick out your own friends. Those that other people may select for you will not be half so true.

I have often read the newspaper item about the young lady who sat in the parlor singing "Don't Forget Your Mother When Her Hair Turns Gray," at the very moment when her mother was washing in the kitchen. Is there any truth in that item? I ask the girls alone—the boys need not answer. I believe that most girls love their mothers dearly. Sometimes they get a little thoughtless though, and forget how much mother has to do, and how easily they might make the work lighter. It is possible for you to be too much of a lady, girls, but you can't possibly be too much of a woman. I wonder if you can see just what I mean by that. Think it over. Do all you can for your mother, girls, and stop complaining. She has to endure three times what you do. Whenever you see her looking tired or discouraged, you just go up to her and kiss her right on the mouth. Don't be afraid you will hurt her or injure yourself in any way. Take my word for it, it will do you both good.

We are having plenty of rain now. In fact, we have a little to spare for some place where there is a dronth. Some farmers are getting a little discouraged about the weather; they have so much hay down and the crops need sunshine so badly that things begin to look blue. When I was a boy they used to tell me such weather is good for young ducks. I think it must be true about that, but human beings sometimes feel that they would like to have such weather all off in some place where the ducks could go and enjoy it by themselves. It won't do to growl about the weather though. Make the best of it. That is all we can do. Plenty of people are worse off. Here is a city man for instance, who can appreciate all that has been said about wet weather.

He has been caught at the corner of two streets, where the wind blows all ways at once. A few days hence he will be in about this condition.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

[Not long ago I had the pleasure of looking over a diary belonging to a good friend of mine. It was written while he was at college quite a number of years ago. I was greatly interested in reading what he had written, and the part that I liked best of all was his account of his experience as a teacher in a district school. You know that many college boys teach school during the Winter in order to earn money enough to pay their expenses at college. He has consented to let me use his notes in something of the form of a story. I am not to mention his name, and I am to write what he has given me in my own words. It is about as near a true story as we can get. I hope there are very few places like Bear Creek, yet I think a great many of our district schools could be made a great deal more effective than they are now. That is partly the reason why I shall tell about this school; so that you can notice all the mistakes that were made, and think how the school might have been made much better. One thing I will tell you. I don't think this young man had any business to try to teach in Bear Creek, yet I suppose he knew as much as most teachers do. I think teachers are like poets—born and not made—and that those who teach just for the sake of making a little money will not do much good unless they are pretty well watched. It is partly because I want to get people to take more interest in schools that I give this diary a place on our page. I hope, if there is anything that seems a little strange, you will get father and mother to read it over and explain it. Remember, I am going to write just what this young man did, without any attempt to explain or defend his actions. If you find any of the characters using bad grammar or saying or doing things that you do not think are right, remember the proper thing is to avoid doing them yourselves.—UNCLE MARK.]

We were sitting in my room at college talking over our plans for the Winter. It was really a council of war, for we did not expect a very peaceful vacation. I suppose most college boys, many of them at least, look forward to the vacation as a season for great fun and rest. We always get such an idea by reading such books as "Tom Brown at Oxford." It was hardly so with us, however. Our vacation meant simply a season of hard work, in which we were to earn money enough to carry us through the next college year. We were about at the end of our finances. I doubt if we had $15 in all. No wonder we met to discuss plans. They were important enough to us. We were students at an agricultural college at the West. We had just come in from work on the farm. George had been digging potatoes. Frank had been husking corn; and Ed. and I had been ditching. Some of the boys may call this rather queer work to be done at a college, but we had grown used to it. A college life without this work would have been all wrong to us, and I really think we got about as much fun out of it as most college boys get out of games or other exercises. My room was not the best of places for holding a conference. There was no carpet on the floor, and I had but one serviceable chair. Frank occupied that, while George and Ed. sat on the bed, and I acted as chairman on the trunk. Plenty of educations are chopped out amid such surroundings at our agricultural colleges. Such educations will not be apt to break when the test comes.

There was but one question to be asked—What are you going to do this Winter?

Frank had found a school to teach in a country district. He had taught in the same place once before, so his way seemed comparatively easy.

George had found a place to chop cord-wood at 50 cents per cord and his board. That was considered great wages in those days.

"I'll come back a millionaire, boys," he said gleefully. "Fifty cents a cord and pick your timber—why I shall have money enough to throw away next year!"

Ed. had a new line of work in view. "I'm going to canvass for the Royal Path of Life," he said, with a genuine book agent's flourish. "I've got that speech reduced to a regular science. Let me sell you a book!"

He ran to the table and brought back my geometry as a "sample copy," and began: "Now just observe the elegant binding, the clear, open-faced type and the fine paper. Here we have a picture representing youth and old age. The little child stands looking hopefully into the future, while the old man sits dreaming of the past."

He would have gone on to the end of the story had not Frank pulled the book away from him, and pretended to call for the dog.

"You may make lots of money out of the 'Royal Path of Life,' but I'd rather plow for a living; but what are you going to do?" And they all looked at me.

"Oh I have the best thing of all; just look here"; and I produced a letter that had come the day before. They all came and looked over my shoulder as I read:

HIGHLY RESPECTED AND ESTEEMED SIR: At a recent meeting of the school board of this district, I had the honor of presenting your application for the position of principal of the educational institute in said district. It gives me a satisfaction which I have vainly attempted to purge from this communication, to announce the fact that you were unanimously elected to fill said position, and it therefore behooves me to remind you that it is now incumbent upon you to qualify yourself, as required by law, and present yourself in said district, at said time, fully prepared to assume the mantle of said authority. In my opinion, it will be well to confine your educational efforts to writing, elocution and deportment, and to the propagation of the elements of that sound morality which lies at the base of all good government. Educationally yours,

CHARLES FOREST,
Director of Bear Creek District.

"Now, boys, what do you think of that? Really, now that I am to be a teacher of education and moral elements, I don't know that I ought to associate with book agents and wood choppers."

In answer to this remark George and Ed. picked me up and carried me to the window.

"Testify to the nobility of book agents and wood choppers or fly to the ground," they shouted.

"Never mind what you do to me boys, but save that letter," was all I could say. "I feel that I havn't lived in vain while I can call out such a note as that."

"So we are all right," said Frank, as the boys brought me back from the window and threw me on the bed. "We are all sure to come back in the Spring. You heard what Prex. said in chapel this morning? He wanted every boy to try and bring back a freshman with him in the Spring. Lets all shake hands on it and agree to turn up in the Spring with a good man. We ought to have a large class."

We all shook hands at once.

"If I come to a place where I can't sell a copy of the 'Royal Path,' I'll drag out a boy any way," said Ed., and we shook hands again glad that we were so well settled for the Winter.

(To be continued.)

NOTES FROM THE COUSINS.

DEAR UNCLE MARK: Uncle Nelson takes your paper and likes it very much. He told Papa if he would take and read it (especially the Eye Opener), he need not do anything else. I have 28 Plymouth Rock chickens, eight ducks and another hen setting on Guinea eggs. I set a hen on 13 eggs, and she hatched one and lost that. She wants to set again, and would you advise me to set her? Many thanks for the seeds you sent me. I planted them and they came up very well.

Kirkdale, Que. JAMES STEVENS.

[I would set the hen again. No doubt she feels ashamed of her poor success and wants to try again.—U. M.]

DEAR UNCLE: One of the Cousins wanted to know how to grow pansies. I will give my way. Fill a box with good rich soil, and about the first of March sow your seed in drills. Set them in the south window, and keep the soil wet. Then about the middle of April transplant on the north side of the house. I think they will grow. Then about the first of December cover them with a little straw or dry grass, and in the Spring they will be nice. I wonder if any of the Cousins read novels. I have read Dickens and Scott, and many others. I have taken music lessons since I was eight years old. I am now 12 years old. I have a small flower garden. Your niece,

Galion, Ohio. EMMA DICKIE.

[I like Dickens. It is much better to read good books than to spend time upon those which are simply "exciting."

DEAR UNCLE MARK: I thank you very much for the package of sweet peas which you sent me. I planted them, and they all came up nicely. We moved to Illinois lately. We like it here better than we did in Michigan. We live on a small dairy farm of 240 acres. We have 22 cows to milk and 26 that we do not milk. We have raised 70 little chickens, and have 100 hens. We have two birds; both are singers. We have lots of flowers. We have got 22 large pigs and 34 little pigs. My sister and I go two miles to school.

From your niece, LILLIE JOHNSON.
Elburn, Ill.

DEAR UNCLE MARK: Uncle Sam sent us some seeds. We planted them, and they are doing very well. We have a very mild climate here. I have never seen ice strong enough to bear a weight of even ten pounds, and when we do have snow, which is very seldom, it always melts as soon as it touches the ground. Father has two cows, two horses and a pig. We live a mile from the Monterey Bay, and we can see the ships and steamers coming into the harbor. Sometimes we can see the breakers dash against the rocks, and toss the spray high up into the air. This county is becoming a great resort for Eastern tourists. It has long been a favorite summer resort for people in the various parts of the State, on account of its even temperature and excellent beach for bathing, but within the last four or five years it has been visited by winter tourists, who pronounce the beach the best they have ever seen, and equal to Long Branch. People were in the surf bathing on New Year's Day.

Your nephew, ARTHUR SMITH.
Santa Cruz, Cal.

DEAR UNCLE MARK: I might have written before, but as soon as I got my work done I could not help improving the play time. I had quite a pretty flower garden last year, but the prospects of a better one this year.

We have nine chickens and five more hens sitting. I have a handsome heifer, one year two months and 23 days old. She stands about four feet high. She is half Dutch and half Jersey. She has good points of being a good cow. Yours respectfully,

E. Deering, Me. MOSES P. ADAMS.

[That ought to make a good cow I think. We want to know how she turns out.—U. M.

DEAR UNCLE MARK: As Papa did not have any boys he said that I must try for the "Clinton Chilled Plow" prize, because he wanted a plow. I have two sisters and their names are Lerah and Daisy. The State Agricultural College is in Fort Collins and my sisters are both attending it. We live on a farm of 160 acres, two-and-a-half miles from Fort Collins. We raise all kinds of small grain, and potatoes. Papa thinks the "Beauty of Hebron" the best kind of potato that he raises.

Your neice, SOPHY STRATTON.
Fort Collins, Colorado.

[I am sorry you did not win the plow. I hope the girls make good college students.—U. M.]

DYSPEPSIA.
My remedy sent free, the result of actual experience with Dyspepsia. JOHN H. McALVIN,
Lowell, Mass. 14 years Tax Collector,

PERSONALS.

THE most important, perhaps, of Victor Hugo's posthumous works is a poem of 6,000 verses, entitled "The End of Satan."

SIR JOHN MACDONALD is the representative in Canada of the Masonic Grand Lodge of England. The Prince of Wales is the Grand Master of this Lodge.

EX-PRESIDENT ARTHUR, feeling somewhat better, went, for the Summer, to New London, Conn., Thursday. His sisters, son and daughter went with him.

NEWLY elected Democratic Governor, Pennoyer, of Oregon, again insists, Dinnis-Kerney-like, that the "Chinese must go," if not peaceably in a body, "go they must anyhow."

OSCAR H. COOPER, the new State Superintendent of Public Instruction in Texas, is the youngest man in the United States holding a similar position—only 23, a graduate of Yale, where he was formerly a tutor.

YET another change of presidents at the Mass. State Agricultural College—President Greenough has resigned, and the trustees have accepted his resignation, and appointed Prof. Goodell as president.

JUSTICE STANLEY MATTHEWS, of the United States Supreme Court, and Mrs. Mary K. Theaker, widow of Judge Theaker, Commissioner of Patents under Lincoln, were very quietly married at a friend's house in this city last Wednesday—no ushers or bridesmaids.

JONES, of Florida, is the only Senator who hasn't introduced a bill at this session of Congress; indeed he hasn't introduced himself. He still lingers at Detroit; but he draws his salary regularly the first of each month—$5,000 a year for doing nothing!

MAGGIE MITCHELL, daughter of the Oregon Senator, is going to marry Count de Rochambeau, heir of the Count of the same name who figured so prominently in our War of Independence, and now an attaché of the French Ministry at Washington.

SAID Senator Edmunds, the other day, in his speech on the land-grant question, referring to Attorney-General Garland, of Pan-Electric fame, "to whom I am always glad to pay my respectful homage as an upright and just man." Strong indorsement from a strong man; but it won't silence vituperation in the least.

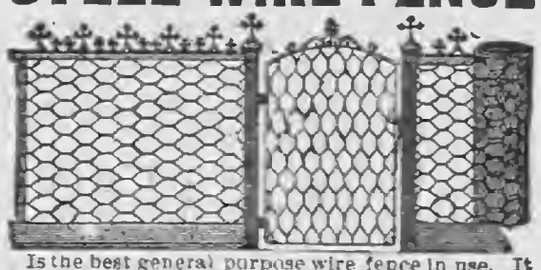
SEDGWICK
STEEL WIRE FENCE


Is the best general purpose wire fence in use. It is a strong net-work without barbs. Don't injure stock. It will turn dogs, pigs, sheep and poultry, as well as horses and cattle. The best fence for Farms, Gardens, Stock Ranges and Railroads. Very neat, pretty styles for Lawns, Parks, School-lots and Cemeteries. Covered with rust-proof paint, or made of galvanized wire, as preferred. It will last a life-time. It is better than boards or barbed wire in every respect. The Sedgwick Gates made of wrought-iron pipe and steel wire, defy all competition in lightness, neatness, strength and durability. We make the best, cheapest and easiest working all-iron automatic or self-opening gate, and the neatest cheap iron fences now made. The best Wire Stretchers, Cutting Pliers and Post Augers. For prices and particulars ask Hardware Dealers, or address, mentioning paper.

Humorous.

"DON'T put in no muskecter-nettin' for me," said Aunt Hannah, "I don't want to breathe no strained air."—*Vox Populi.*

"IF I cannot have the fat of the land, I can take a little lean," said the tramp, as he rested his shoulder against a lamp-post.

DUDE—"Excuse me, Miss Sharp; I had quite forgotten you; I am so absent-minded, doncher know?" Miss Sharp—"Yes, I have noticed the absence of mind."

A LADY writer asks: "Why don't bachelors marry?" That's so—why don't they? Come to think about it, we have never seen a bachelor who was married. It's lamentable, too.

"GIVE us, O give us the man who sings at his work," says Carlyle. "Oh! yes; give him to us; deliver him into our hands. He occupies the next office, and we can't get at him."

THERE is one place in this country—away down in Maine—where the people are so polite that they never speak of unmarried ladies as old maids. They simply call them ladies-in-waiting.

JOHNSON says he likes New-England girls, because they always extend every court-easy to the strange and eligible young man visiting in that section.—*Cincinnati Merchant-Traveler.*

IT is said that much suffering is caused an animal by defective shoeing. This will be readily understood by noticing a woman shoo a hen. The poor bird does not know which way to go.—*Boston Post.*

"Do you think you can clear him?" she asked of the lawyer. "I don't know, madam," replied the attorney doubtfully. "He has lived here all his life, sir, and knows every one." "Yes, that is what makes me nervous about it."—*N. Y. Graphic.*

"HAS your father got his affairs wound up yet?" said a Cleveland man to young Mr. Flatt, whose paternal parent, Flatt, the jeweler, recently made an assignment. "No," answered the youth, "an' he ain't likely to get 'em wound up inside of twenty years." "How so?" cried the astonished citizen. "Why, his assets are mostly in Waterbury watches."

A POOR SHOT.

The Latest Improvement IN Traction Engines.

The only Engines where the power is practically and successfully applied to the four truck wheels. Exceeds all other Traction Engines in pulling and steering through mud holes, sand, or any soft or uneven ground, or on any road. Is the result accumulated from a third of a century of study and practical experience in the manufacture of

PORTABLE,
Agricultural & Stationary Steam Engines.

With determined policy to build only the BEST MACHINERY from the BEST MATERIALS, and in the BEST MANNER OF CONSTRUCTION, and with continued improvements, have attained the HIGHEST STANDARD in excellence of workmanship, simplicity of design, and capacity of power.

In addition to our STANDARD ENGINES we now offer the first ROAD ENGINE which has the Traction Power practically and efficiently applied to the four truck wheels, and while so applied to each wheel independently, the forward axle is under full control of the steering apparatus.

Descriptive catalogue will be sent on application.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1902. NEW YORK, JULY 10, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

SPECIAL.

PROMISE of a GOOD HARVEST

WHEAT.

Winter wheat, a good crop on the whole; a considerable increase over the area harvested last year; little plowing up; poor crop and smaller area in the South; best crop in California; poorest in Kansas; probable aggregate yield 295,000,000 bushels against 212,000,000 in 1885. Decrease in area of spring wheat; considerably injured by drought and blight; probable yield 140,000,000 against 145,000,000 in 1885.
Total crop 435,000,000 bushels.

OATS.

Slight increase in acreage; considerably injured by drought and insect pests; probable yield 600,000,000 bushels against 629,000,000 in 1885.

RYE AND BARLEY.

Slight increase in acreage of rye; grown chiefly for grain in the North and pasture in the South; slight increase in production; considerable increase in area of barley, especially in Kansas, Minnesota, and the Pacific Coast. An excellent crop.

CORN.

Acreage about the same; a good stand; outlook good for a fine crop.

POTATOES.

Decrease of area in New England owing to the low prices and rot; early potatoes a heavy crop; late promising, especially in the West.

GRASS.

Large increase in acreage; supplanting potatoes in New England; much greater cultivation of tame grasses in the West and South; considerable increase in clover; a heavy hay crop, injured somewhat by drought.
Pastures good.

TOBACCO AND HOPS.

Slight increase in area of tobacco; prospects fair. Decrease in hop area; crop generally excellent; late reports of threatened destruction by insects and "honeydew" in New York.

COTTON.

Slight decrease in old States more than counterbalanced in the new, mainly in Texas; condition lower than in 1885.

FRUIT.

Outside New England apples likely to be only a fair crop; young fruit dropping excessively everywhere; generally the "bearing" year; poor crop in the South; much injury to orchards by winter cold and spring frosts in the Ohio Valley and Northwest. Pears a poor crop. Peaches below an average. Strawberries too plentiful for profit. Other small fruits good crops.

EASTERN STATES.

Maine.

BIDDEFORD, York Co.—Hay now promises to be a large crop; potatoes show up finely; many early planted lots are now in bud. About the same quantity put in this year as last; garden truck now coming in freely in good condition; strawberries now ripening. First pickings to any amount will be offered the first of next week. The apple crop promises to be large. J. L. L.

DEXTER, Penobscot Co.—Grass is looking well; a full average crop. Grain of all kinds growing rapidly, and a full harvest is anticipated. Potatoes looking well. Corn an average, excepting sweet corn, which did not come up well; two-thirds or three-quarters crop is all we can expect, much of it having to be replanted. Feed good, and stock doing well. F. H. S.

SKOWHEGAN, Somerset Co.—We are having a dull spell with some rains, which we hope will continue long enough to restore the damage to all crops by our recent drought. We had an early Spring and fine weather up to first of last month, since which all crops have suffered for rain. Grass, especially will be light on old ground, but may on the whole be an average yield. Oats is our principal grain crop, and is looking well; wheat and rye very little sown; corn did not come up well and is backward. The season has been too cold thus far. Potatoes, not much planted except for home use; they are looking well, with fewer bugs than formerly; apples blossomed profusely, and have set well and promise a crop fully equal to last year's. All small fruits plentiful. Farmers who patronize the butter factory find that their outputs for commercial fertilizers are gradually growing less—one of the greatest benefits from the factory system. J. H. L.

New Hampshire.

HAVERHILL, Grafton Co.—Hay crop heavy. Apple crop better than could be expected. Small fruits plentiful. Potatoes looking well. J. O. G.

MANCHESTER, Hillsborough Co.—Corn, from 75 to 90 per cent.; wheat, but little raised here; early oats looking fine, will be more than an average crop; rye, most raised for fodder, has been mostly cut, a fine crop; barley, same as rye; potatoes, prospects for more than average crop, large area planted; garden truck, early cabbage, badly damaged by cut-worms and maggots; beets, mostly destroyed by cut-worms; onions, started well, but maggots are destroying them very fast, small crop in prospect; celery, plenty started, and prospects good; apples, few and poor; grapes looking well; pears, small crop; but few peaches raised here; peas looking finely, large crop; carrots, parsnips and turnips looking well and large area; blackberries and raspberries looking well. A. H. W.

PETERBOROUGH, Hillsborough Co.—The earliest season we have had for a number of years. Corn is backward on account of the cool weather, but is looking fully as well as last year at this time. Grain of all kinds is ahead of last year, and promises a heavy yield. Potatoes looking exceptionally fine. Apples, the prospect is for the largest crop for five years past. On the whole, the prospect for the farmers in this part of the country is very encouraging. Grass looks fine, and a heavy crop of hay is the prospect, which has not been the case for three years past. C. N.

PORTSMOUTH, Rockingham Co.—Our staple crop is hay, which promises to be more abundant than for several years. Wheat, tobacco, sorghum, hops, broom-corn and peaches none raised. Oats, rye, barley above the average. Potatoes and garden truck better than last year at this time. Apples promise well where the trees are not infested with canker worm. Pears below an average. Only a few grapes raised, but looking well. Season one or two weeks earlier than last year. C. E. T. Y.

SWANZEY, Cheshire Co.—Oats, corn, rye, potatoes are of the average; garden truck looks very well, or would if it wasn't for the cutworms which are working corn badly to the north of us. C. H. R.

Vermont.

GEORGIA, Franklin Co.—Spring opened unusually early, but for want of seasonable rains the frost left the ground very slowly, and the surface was, to a large extent, in tillable condition, while there remained a very considerable stratum of frozen earth below it. The result is that upon all undrained lands the growth of nearly all crops has been exceptionally slow for this latitude. As the season has advanced, the rains have been quite copious, and grass and the small grains have made a more vigorous growth. To casual observers who base their estimates on what they can see from the car windows or their carriages, these crops promise a very unusually heavy yield. Such observers are looking for a good deal more than an average hay crop, and we frequently hear them placing it at double that of last season. But farmers who carefully go over their meadows and note the sad havoc here and there of the summer droughts, and the winter freezes among their grass roots, and the very large proportion of daisies and other foul weeds which are springing up in the place of better grasses, sadly shake their heads and limit their expectations at a good average crop—perhaps 50 per cent. better than last year. The small grain crops compare favorably with last year's, but are not notably better. The universal testimony is that corn never came up so slowly or made so slow a growth after it was up. Generally the crop stands well, considering its size; but in some localities the cut-worm has done some damage. I have heard of a few fields being harrowed up and sown to barley or oats. With a favorable Autumn there is yet time for a good corn crop, but the present outlook is not favorable. Potatoes and garden truck are doing well. On the drained gardens in the village of St. Albans, they are a week or two more advanced than a year ago, but such is not generally the case. My own early peas are not half a week earlier, though planted two weeks earlier. The three earliest varieties are just in bloom. My earliest snap beans, two varieties, have not grown more than an inch in two weeks from the time of planting. The later plantings promise to outgrow them, though they look green and healthy. Fruit trees, with the exception of plums, blossomed full, but the fruit is mostly blasted, though a small crop may be perfected. I have a curiosity in the shape of a cherry tree, a large part of which is now in bloom. O. S. B.

MANCHESTER, Bennington Co.—Corn, area, 104; condition, 110; oats, area, 100; condition, 105; rye, area, 100; condition, 110; potatoes, area, 100; condition, 105; apples, condition, 120; pears, condition, 110; grapes, condition, 100; hay, area, 100; condition, 110. G. G. B.

NEWPORT, Orleans Co.—All crops, including fruit, look well. Grass unusually heavy and forward, and potatoes much in advance. Corn is up and looks well, but the weather has not been warm enough to push it. Rye is heading, wheat looks well, and oats are promising. The apple crop will be good if no accidents occur. All gardens look well. Hop culture has declined here somewhat, but the prospect of a crop is good. Small fruits look well. T. H. H.

NORTH BENNINGTON, Bennington Co.—Corn, oats, rye and potatoes look about as well as at this time in other years; hay, a better crop than last year. C. B. A.

WILLIAMSTOWN, Windham Co.—Potatoes, corn, oats, wheat and barley, also the hay crop are looking better than they did last year. H. T. E.

Massachusetts.

GLENDALE, Berkshire Co.—Corn, good prospect; about the usual area; wheat very little if any. Oats, rye, potatoes and garden truck, good prospects. Potatoes, I think more than usual planted; the area increasing every year. Apples and pears are about an average of last year's. Peaches and grapes fair; just coming in blossom. Grass never looked better, but there is danger of it lodging a good deal. J. H.

LEYDEN, Franklin Co.—Grass is looking better than at the same time last year. Corn, oats, rye and potatoes are looking well. Insects very injurious to garden truck. Apples and pears half crops. No peaches this year. N. F.

Rhode Island.

WARREN, Bristol Co.—Corn, about the same area as last year; condition about the same; wheat, very little planted in this section; oats, are looking well, and bid fair to be a good crop; limited area of rye planted, looking first-rate; about the same area has been planted to potatoes, they have not sprouted well. Whole fields have been plowed up, thus reducing the area planted. Potato bugs out in full force. Apples bid fair for a good crop; yellows and cold winters or rather extremes of temperature have destroyed so many peach trees, that the peach is not a profitable crop. Strawberries an abundant crop. Early cabbage very much injured by maggot and cut worm. J. B.

Connecticut.

BRISTOL, Hartford Co.—Corn, rye and oats look well—rather better than usual—but the grain crops of this State do not affect the market much, for there is no farmer raises any to sell, and most farmers have to buy. Buckwheat, one-third more than last year; hay, a quarter more. The potato crop will be much larger than last year. Not much tobacco raised along the Connecticut Valley. There is not so much set out as last year, owing to the low prices. Apples will not be any more than a quarter of last year's crop. Peaches, none. Garden truck looks well; only enough raised for home market. C. D. P.

SAUGATUCK, Fairfield Co.—All winter grain good; oats and potatoes very good; grass large; corn rather backward; fruit moderate; onions good. G. C. B.

TERRYVILLE, Litchfield Co.—Corn not quite up to the average; did not come up well. Wheat, none raised about here. Oats, rye, potatoes and most garden truck, above average. Apples, not up to average: the trees overbore last year. Pears not up to average. Peaches, better than last year, but not very promising for a big crop. Plums, up to average. Grapes and hay above the average. C. W. C.

WEST HAVEN, New Haven Co.—Corn backward, but improving fast for the last week. Wheat, very little raised, but looking well. Rye, a full acreage and forward. Oats and barley promising. Potatoes better than an average. Grass better than for years. Garden truck doing well. Apples not set, except Baldwins, and those orchards attacked by canker-worms. Season thus far moist and rather cool. L. A. B.

MIDDLE STATES.

New York.

AUBURN, Sullivan Co.—Wheat, oats, rye and barley are looking fine—too well, if anything, as there is danger that they will lodge before time for cutting. Corn is generally backward, owing to the fact that a large share of the farmers have been compelled to plant a second time. Potatoes and garden truck looking well, and are very early. Hay light—weather too dry. Peaches, plums, cherries and apples have forsaken us this year. Crops are two weeks farther advanced now than at the same time last year. D. P. H.

BORODINO, Onondaga Co.—All crops are in advance of last season, except corn, which is not as good as in ordinary seasons, mainly owing to the seed failing to grow on account of coldness of soil. Many farmers are planting beans to fill up the row. Winter wheat is much better than last year, while oats and barley are fully better than an average. Potatoes are looking fine; strawberries are in excess, so that 6 to 7 cents per quart is the ruling price, instead of 10 cents as in former years; pears, apples and plums are set sparingly, although the bloom gave promise of an abundant crop; meadows are rather light as a whole, and haying will begin 10 days earlier than usual. Grape-vines which were not laid down were badly winter-killed, but those who

cared for their vines have promise of plenty of fruit. Fullers' teasel is raised quite extensively here,and rarely ever looked more promising than now. From 60 cents to $2 per thousand are the outside prices paid for them, while from 75,000 to 200,000 from an acre give an idea of the yield. G. M. D.

CANAJOHARIE, Montgomery Co.—Prospects not as good as last year for average crops. Too dry. A rain has now set in which may relieve us somewhat. Hay, 75; corn, backward; wheat, where not winter-killed, average. Many pieces nearly all killed. Oats, where sown early, bid fair to give a full crop. Rye, an average. Barley none. Early potatoes have suffered from drought. Orchard fruits, 50. Hops looking poorly. Cows are doing well; the flow of milk is equal to last year's. T. O. W.

CANASERAGA, Albany Co.—As compared with last year, spring and winter wheat about 80; corn, as good; oats, about two-thirds; barley, about two-thirds; potatoes, about the same; apples, good for the "off year;" hay, about one-half to two-thirds. It is very dry here, and unless we get rain soon spring crops will not be as good as reported. Wool, 25 to 30 cents. F. M.

CATON, Steuben Co.—Corn, oats,rye and barley about the same. Wheat and potatoes off one-third. Apples not one-half crop; other fruits an average. Grass poor. J. M.

CHATHAM, Columbia Co.—Early in Spring prospects for all crops were excellent, but lack of rain is making bad results. A good average crop of hay, but by no means a full crop. Oats are turning yellow from dry weather, but they will probably be a fair crop. Corn doing well. No wheat or barley of any consequence raised; potatoes doing well; apples will be light. For other fruits a fair prospect. Cherries are terribly troubled with the black aphis. All insects are numerous, owing to the favorable weather in April for their development. No frost to kill eggs or insects. General outlook favorable for the farmer, but much will depend on early rains. J. W. D.

CLINTON, Oneida Co.—Corn is slow; stands even; has good look; needed rain just falling; wheat in excellent condition; potatoes, good; but hardly so good as last year. Apples blossomed rapidly; but a check in bloom, and young growth started a perfect plague of lice. For pears this is the "off" year, but they will be in good supply; grapes are very fine; sorghum is not so much grown; hops so far are moderately good; cherries and plums very full. E. P. P.

CLYDE, Wayne Co.—Hay will average as good as last year; old meadows are complained of as short; low meadows were injured somewhat by water; corn is promising a little better than last year; much of it is late, however; low lands could not be planted till the last of May; oats and barley promise to be as good, if not better, than last year; wheat, good, and will be better than last year; no Hessian fly or midge to speak of; potatoes equal to last year's; apples bloomed to the utmost—the bearing year—two weeks or more earlier than last year; the blossoms fertilized perfectly, for the trees averaged five apples to the twig, when the size of large peas; since they have fallen off at a tremendous rate until we haven't one apple to five twigs; the complaint is general. The crop will be as short as that of 1882. Grapes, 100; berries, 100; hops, 60; pepperment, 90. W. X.

EAST HAMLIN, Monroe Co.—Corn poor, owing to poor seed it did not come out well. Wheat looks well. Oats are an average; barley the same. No apples, pears or peaches to any amount. Apple orchards were full of blossoms, but the fruit all dropped. H. M. G.

FRANKLIN, Delaware Co.—Ours is not a corn section strictly speaking, but about the usual area is planted and is looking fairly well and with favorable weather, from now out there may be an average crop, though we have had many cold nights so far. Oats about the usual acreage and until the past two or three weeks, they did finely; but the weather is now getting very dry, and if it continues will greatly shorten the crop. Wheat, rye and barley are little grown, hay, our main crop, on the low lands along the streams will be much better than last year, while on the hills many old meadows were badly winter-killed and will be very light. Potatoes promise an average yield, but they greatly need rain just now. Apples will be a full average crop—following the largest crop last year ever known in Delaware County. E. J. B.

FULTON, Oswego Co.—Corn backward; wheat rather poor; oats, rye, barley and potatoes about an average; apple and pear prospects good; hay poor; tobacco not as many acres as usual. E. H.

GENEVA, Ontario Co.—Corn, backward; many fields had to be replanted; wheat, fine condition, 100; oats, fair, but being injured by drought; rye, first-class crop; barley and potatoes, backward, because of dry weather. We have been having a severe attack of this. C. S. P.

GREENWICH, Washington Co.—Corn acreage about as last year; oats look fine; acreage about as last year; rye fair crop; potatoes doing well; acreage planted about as in 1885; garden truck never better; apples plentiful prospect; other orchard fruit, fair crops; hay, old meadows light; new seeded and clover, good crop; small acreage of flax sown, looking well. J. G. S.

HARTWICK, Oswego Co.—The only field crop that looks as well as last year at this time is the oat crop; apples, pears, plums and all other fruits are looking about the same. H. O. B.

HIMROD'S, Yates Co.—Wheat good crop and fair average with last year. Oats looking well. Rye is filling well. Barley never looked better. Potatoes and garden truck good. Apples, peaches, pears and other orchard fruits abundant. Grapes good. Clover heavy; hay grass light. Corn good. G. A. B.

KINGSTON, Dutchess Co.—Corn promising, planting was somewhat delayed by wet weather. Wheat and rye wintered well; acreage not large; crops fair; oats average, equals 85; no barley grown here; potatoes look well; bugs less troublesome than usual; full crop now indicated; growth in advance of last year this time; garden truck in general also maturing rapidly; apples, heavy crop now indicated, by far too heavy; pears below the average; plums loaded; curculio very active, black-knot destroying every twig; peaches, very light yield promised; grapes, loaded beyond precedent; all small fruits abundant; large hay crop almost matured. H. H.

MARLBOROUGH, Ulster Co.—Grain up to the average. Grass half a crop. Potatoes and garden truck average. Apples better. Peaches 25. Grapes average. J. G.

PHELPS, Ontario Co.—Corn is one-fourth less than last year; wheat a little better; oats five to ten bushels per acre; barley hardly as good; potatoes are looking fair; apples and pears less; peaches, none; trees drying; the dry weather has damaged hay one-eighth; hops are hurt by the same cause. H. P.

RHINEBECK, Dutchess Co.—Corn backward; will need warmer weather for a full crop. Wheat a good average. Rye good in both grain and straw. Potatoes a full growth of vines; outlook good. Of apples next to none. Pears and cherries a fair average. Plum trees and grape vines heavily loaded. Raspberries and currants, enormous crops. Hay a fair average; much better than last year. J. L. V. W.

ROCHESTER, Monroe Co.—Wheat promises a full average yield, but the acreage is not as high as in former years. Corn has largely failed to sprout. Many farmers have replanted, but the corn crop is greatly retarded in consequence and the outlook is discouraging. Potatoes promise fair. Oats are but little sown, barley largely taking their place. Barley is looking fairly well, but is suffering somewhat from dry weather. The hay crop promised well early in the season, but expectations have not been realized; the latter weeks have been too dry. Beans have met with the same fate as corn. Outlook not encouraging. Apples seem to be an entire failure. Altogether the farmers in this vicinity are not very much encouraged with the outlook, considering the low prices that are ruling. C. A. G.

SOUTH CAMERON, Steuben Co.—We had an unusually early Spring and every indication of good crops, but the outlook is not so good. We did not have any rain for four weeks and four days, until last week, Wednesday, when we had a good shower of about 30 minutes' duration, but the ground is as dry as ever. Winter wheat, excellent; hay, about half a crop; early sown oats and barley fair; large acreage of buckwheat; many meadows turned over and sown to this grain. Good milch cows sell for $30. Seed buckwheat 60 cents per bushel. J. W. W.

Pennsylvania.

ANTHENS, Bradford Co.—The average present condition and future outlook for the following crops in this section, as compared with the condition and outlook at the same date last year, are 25 per cent better:—corn, wheat, oats, rye, potatoes and garden truck, apples, pears, peaches, and other orchard fruits, grapes, tobacco, etc. Hay is only 75 per cent of last year's crop. T. B.

AVONDALE, Chester Co.—Corn, three weeks behind; wheat, better; oats, very good; potatoes, very good. The apple crop will be a heavy one here if prospect holds good; grass, very good. J. H. T.

BEECHTREE, Jefferson Co.—Wheat a fair average crop as compared with last year's. Grass not so good. Corn more forward than at this time last year; oats and potatoes promise good crops. Apples are good. G. B.

FAIRVIEW, Erie Co.—It was extremely dry here since Spring opened, until the 17th, when we got a good rain, which has greatly revived things and future prospects. As compared with last year, corn is 100; wheat, 125; oats, 85; rye, 90, but increase in area; barley, 85; potatoes, 80; hay, 75; garden truck, 80; apples, 125; pears, 50; peaches, none last year, but some this and plenty near the lake; plums, trees overloaded this year, none last year; cherries, 125; grapes, 75. T. M. R.

GLENBURN, Lackawanna Co.—Oats, rye, wheat look better. Potatoes and corn backward; planted late. Fruit will not be an average crop; last year was the bearing year for most orchards. Onions, tomatoes and garden truck look well. The hay crop will be light; the cut will not exceed that of last year. H. N.

GRANVILLE, Mifflin Co.—Spring opened at least two weeks earlier than last year, and everything has come on rapidly. Prospects excellent for a good crop of corn. Wheat and rye badly winter-killed in some fields; but the average will be considerable above that of last year. Oats look well. A large crop of early potatoes, strawberries, cherries, peas, beans and all kinds of early garden truck. Peaches few, the trees failing to blossom. Apple and plum trees well loaded; pears not so good. Grapes, raspberries and huckleberries very promising. Farmers have commenced to make hay; the crop will be double that of last year. H. M. R.

HARRISBURG, Dauphin Co.—Wheat, in the section inclosed by a line drawn south from Harrisburg to the Maryland, and another east from Harrisburg to the Delaware River, will probably give a crop considerably above the average; but the average in the whole State will be reduced by the diminished yield of some of the interior and northern counties, notably that of Center, where the absence of snow during windy weather last Winter and Spring and the the ravages of the fly in Spring, have reduced the crop far below the average. The area of the crop is estimated at about 1,550,000 acres, and the possible yield at 19,750,000 bushels. Corn, condition varies greatly in different portions of the State; not only in adjoining counties but also upon adjoining farms; that which was planted in the eastern part of the State, early, is in fair condition, but late planted fields are looking bad and will, at best, yield but a partial crop; much replanting was necessary, and whole fields were replowed and planted the second time; much of the crop looks yellow, but with a continuation of the present favorable weather, will soon recover much of the lost ground. Area planted estimated at 1,200,000 acres. The cool damp weather has promoted the growth of oats, which stand thickly; probable acreage 1,100,000; prospects fully up to an average. Potato crop is fully up to the average of the past 10 years; in many localities the Colorado Beetle has done more damage than during the past two or three years, but the liberal application of Paris-green has prevented much loss from this cause; a slight increase of acreage over the average of the past 10 years, and a probable decrease as compared with that of last year; low prices and a wet Spring have combined to discourage the extensive planting of this crop. Hay, in most of the eastern and southeastern counties, will be a very large crop, but in many of the northern and western counties it will be below our average for the past 10 years; estimated cut 2,500,000 acres. Yield probably not far from 3,000,000 tons. Apples will be above the average. Small fruits are and will be unusually abundant in the eastern and central counties, and the falling off in the western part of the State will be more than balanced by the production in the east. An unusual crop of plums; most of the trees are too full to produce the best quality of fruit, and some of our best growers have removed a portion of the crop so that the remainder may be properly filled up. T. J. E.

INDUSTRY, Beaver Co.—Crops have all suffered from drought, especially the grass—clover is good but Timothy very light and full of "white tops" in many fields. Corn is very small yet—cut-worms were worse than for many years past. Wheat, a fair crop—some now ripe. Oats look bad, but may yet be a fair crop. The apple crop will be light and pears very scarce. Peaches, a good yield, but few grown here. E. E.

LACYVILLE, Wyoming Co.—Wheat and rye full average crops. Oats good. Corn fair. Hay light—two-thirds of crop. Peaches a failure—trees winter-killed. Apples light. J. R.

MILLER'S STATION, Crawford Co.—Wheat good, oats good, corn rather backward. Potatoes looking well. Apples a fair crop. Hay from half to two-thirds crop. J. B. B.

OXFORD, Chester Co.—Corn, early planted, looking well, later planting (fully two-thirds owing to wet weather) did not come up well, some having to plant a second time; will require late Fall to mature. Wheat, straw large and the crop will be above the average. In some localities, many of the heads have been cut off by worms. Oats looking very well; heading now; will be fully up to last year's if not injured by storms; potatoes looking well; hay, clover, very good; Timothy very light; apples, above the average; pears, will be short; peaches, good; little or no tobacco planted this Spring. Crop has not been paying. J. H.

SHARPSVILLE, Berks Co.—Corn, 100; wheat, 90; oats, 80; potatoes and garden truck, 100; apples and pears, 90; peaches and grapes, 50; hay, 70; small fruits, 100. G. B.

SUGAR GROVE, Warren Co.—As compared with last year, corn is 110; wheat, 90, nearly all winter wheat; oats, 105; rye, 95; barley, 100; potatoes, 105; gardens and apples, 100; pears, 105; peaches, none, and none last year; plums, 150; grapes, 90; hay, 80. F. R. M.

TYRONE, Blair Co.—In this and Centra County the severe cold of last Winter, which occurred when the snow had been taken off by a thaw, damaged wheat seriously. The Spring was favorable, no frost after April 1, except on April 5 and 9, and then only 32 degrees. Abundant rains in May and June,and much cloudy weather. This has been unfavorable for corn, and has rotted strawberries, which have also suffered by the Winter, as had the wheat plants. But it makes a heavy grass crop and fine promise of oats, potatoes and other garden crops and small fruits. Cherries unusually plentiful. Apples promise well, although the "off" year; so do grapes; pears, a small crop. W. G. W.

UTAH, Indiana Co.—Crops compared with last year at this time, are about as follows in West-Central Pennsylvania: Corn, 105; wheat, 105; oats, 100; rye, 100; potatoes, 100; garden truck, 100; apples, 75; peaches, an entire failure both years; cherries, 200; grapes, 100; hay, 75. J. L. M.

New Jersey.

BLAIRSTOWN, Warren Co.—Wheat better than for several years. Oats good. Rye heavy crop. Corn not a very good stand. M. H. C.

BRIDGETON, Cumberland Co.—Corn, good take; waiting for hot weather; wheat, soon ready for harvest and a good crop; oats, never a better promise for a good crop—we are too far south for oats, the heat of June generally shortens the product.—[Oats are grown to the Gulf.—Eds.] Rye, good, not much grown; potatoes and garden truck, never better; apples, pears, and peaches, good show for fair crops. All crops grown in this section give promise of good returns. C. E. E.

CEDARVILLE, Cumberland Co.—Corn is small for the time of year; wheat above an average; oats, good—not many sowed; rye, straw large; garden truck, uncommonly good; apples good; peaches not so good as last year; early potatoes very good; sweet potatoes very small for time of year. S. S.

ELMER, Salem Co.—Corn a little backward, owing to wet weather. Wheat looking well. Grass, a heavy crop where a stand was got last season. Oats and rye both good. Potatoes, rather larger acreage planted this season than last. Early ones a good crop assured. Garden truck abundant, owing to continuous rains of May and June. Apples promising; pears good; peaches none of any extent in bearing in this locality. Fruits slightly damaged by hail. R. W. S.

FRANKLIN, Ossett Co.—Corn, rather backward, owing to very wet weather; rye, good—the late rain put some of it down; potatoes rather uneven; some look very good, but a good many did not come up well. One man planted some whole potatoes to fill out and they have come up and look decidedly better; garden truck looks well; lots of apples bloom, but I have seen more apples. W. V.

HANOVER, Morris Co.—Corn, backward; wheat, better; oats, promising; rye, the same; barley, none raised; potatoes, poor, crop will be a partial failure. Garden truck good; hay, 150. F. J. R.

MARLBORO, Monmouth Co.—The Rural corn bids fair to be a good crop. Wheat, rye and oats will be about an average; hay will be at least a quarter heavier than last year; peaches, scarcely half a crop; apples, about an average; potatoes promise well, except the late-planted which don't come up well, so that much replanting had to be done. P. W.

NAUGHRIGHTVILLE, Morris Co.—Corn came up badly; was planted even, and looks generally backward and uneven. Oats promise a fair crop; wheat and rye, good; potatoes and

garden truck about an average, but the potato bugs are worse than ever before. The hay crop will be the best for several years. Apples, cherries, peaches, pears, and grapes are all good here, but in many places, in this and adjoining counties, the fruit has fallen off to a large extent. J. S. C.

PATERSON, Passaic Co.—Weather too cool for many crops. Wheat, rye and oats are all very good. Hay promises better than for the last five years. Potatoes and garden truck doing well. S. M. J.

Delaware.

DOVER, Kent Co.—May was wet and mostly cool, yet vegetation has grown right along. Corn is being worked the second and third times. Wheat, a fair crop. Black-caps and blackberries look promising. Peaches are dropping very badly—more on the ground than on the trees. Other fruits in abundance. S. T. S.

GREENSPRING, Newcastle Co.—Corn not looking as well as last year; wheat about 15 per cent. better. Rye and barley are not grown here to any extent. Potatoes and garden truck about the same as last year. Apples are more plentiful. Pears not so good. Peaches about half as good as last year in some sections, and in others all killed by the freezing weather in February. Grapes about the same as last year. Hay is at least 50 per cent. better. Oats about the same. J. J. W.

HOCKESSIN, Newcastle Co.—Corn, acreage 75; condition 80; wheat, condition 100; oats, condition 90; potatoes, acreage 80; condition 60; apples, 85; pears, 50; grapes, 95; hay, 105. These are the principal crops raised in my section. I have used 100 to represent an average. T. L. I. B.

MCDONOUGH, Newcastle Co.—The wheat crop better than last year. Grass is heavy, but wet weather has interfered somewhat with haying. Corn is looking well. Good season for oats, but not a large amount sown. P. W. A.

MILTON, Sussex Co.—Nothing has suffered for lack of rain. Corn, area, 100; condition 95; wheat, area, 100; condition, 100; oats, area, 80; condition, 100; potatoes, area, 90; condition, 100; garden truck, area, 90; condition, 100; apples, condition, 95; no peaches in this vicinity. What few there are in the country are near salt water. D. E. W.

SMYRNA, Kent Co.—Corn, backward; wheat, a trifle better than last year; hay full crop, but no weather for making; grapes, full. Apples and pears light; peaches, quarter to half a crop. W. P. C.

Maryland.

ALLEN, Wicomico Co.—The average present condition of the following crops as compared with last year at the corresponding time is: corn, 50; wheat, 125; oats, 300; rye, 125; potatoes, 150; apples, 75; pears, 75; peaches, 75; grapes, 150; hay, 300. O. P. J.

CALVERT, Cecil Co.—Corn very late, but looking well, with a favorable season will come up to last year's crop. Wheat never looked better at this time; 15 per cent. better than last year. Rye and barley not much raised. Potatoes and garden truck come up to last year's. Apples, pears, peaches, hay, clover better, and Timothy not so good. J. M. H.

CATONSVILLE, Baltimore Co.—Wheat and oats better than last year. Rye a full average; corn, uncertain. We have had many rains since May 1, which have hindered working ground before and after planting. Potato prospects good. Apples, probably a full crop. Pears a good crop; peaches fair. Hay full average, but full of weeds. Garden truck pretty good. Weather has been and is very cool and cloudy. A. L. C.

CHESAPEAKE CITY, Cecil Co.—Wheat a full average crop; oats, but few sown; prospects good. Corn late, but looking well. Have had continuous showers for a month past. Grass crops, clover and Timothy, heavy where the catch was good. Peaches (acreage much reduced from a few years since), prospects good for full crop on what remains. Cherries and all small fruits, prospects good. Early potatoes, prospects good for full crop. Apples and pears very light crops. T. B. H.

DENTON, Caroline Co.—Corn, quite as good as last year. Wheat better, heads larger; looks fine. Never saw oats so good. Rye fully equal to last season's. Potatoes and garden vegetables better. Apples and pears not as heavy a crop as last season. Peaches not half a crop here, and the "June drop" has begun. An abundance of grass and clover, but no hay weather; too much rain. Grapes promise well now; but then, the rot. J. W. K.

EASTON, Tabot Co.—There has been much wet weather. Pasture good as compared with last year. Corn about 100; wheat (now being harvested) 100; oats, 125; potatoes and other small truck 100; apples and pears, 80; peaches, 100; grapes, 100; hay 150; (unusually fine growth of Timothy) most farm products promise bountiful yields—Prospective prices very low. T.

FREDERICK, Frederick Co.—Corn not quite so good as last year, owing to so much being planted late. Wheat nearly double, except where injured by fly. Oats, a full crop; rye, not so good. What little barley there is will make a full average crop. Potatoes a full crop. Garden truck much better than last year. Hay more than double the crop of last year. Apples a fair crop. Pears half a crop. Peaches and grapes very abundant. Small fruits promise an abundance. D. G.

NOTTINGHAM, Prince George Co.—Wheat above average of 1885. Corn generally good, but a deal below last year at this time, owing to late planting. Oats and rye above average; potatoes and garden truck ditto. Apples fair crop. Pears scarce. Peaches fair to good. Hay generally above an average. Tobacco, the main crop of this section, generally later than last year, although those few whose stand was not injured by fly are ahead, and their crops looking fine. W. W. W.

SALISBURY, Wicomico Co.—Wheat promises well; oats unusually good; rye very good; potatoes very good; peach prospect good. S. A.

SOUTHERN STATES.

Virginia.

BERKELEY SPRINGS, Morgan Co.—The corn crop promises better this year than last. The wheat crop will be from 50 to 60 per cent. larger. There will be large crops of oats and rye; potatoes promise to be good. The fruit crop will be exceptionally good, consisting of apples, pears and peaches. This county contains many orchards that are beginning to bear well, but it cannot as yet be classed as a large fruit-growing county. E. VAN R.

CLAREMONT, Surrey Co.—Outlook good for a very abundant fruit crop, including all kinds that are grown in this climate. The season favorable for all kinds of crops, particularly small grain and grass. E. D. A.

CLEEKS MILLS, Bath Co.—Wheat promises full average crop—far ahead of last year—average acreage. Rye about an average of other years. Oats more sowed than usual, not quite so promising as last year. Corn, much late-planted; weather too wet to work it enough; too little sunshine. Grass, our principal crop, above an average. Potatoes look fine. Apple crop must be light, many trees not having bloomed. Best fleeces brought 20 cents per pound. W. R. G.

DALEVILLE, Botetourt Co.—As compared with crops last year at the same date, the average wheat acreage is 25 per cent. more; average yield 30 per cent. more; corn area 10 per cent. less; yield 30 per cent. less; oats 25 per cent. more; yield 10 per cent. less; potatoes acreage the same; yield 10 per cent. more; garden truck area unchanged; yield 5 per cent. better; apples 10 per cent. less; peaches 5 per cent. less; tobacco area 15 per cent. less; condition the same; hay area 5 per cent. more; yield 5 per cent. less. D. C. B.

FREDERICKSBURG, Spottsylvania Co.—Wheat area about same as last year, condition 10 per cent. better; corn area small, due to wet weather at time of planting. If season continues good, crops will be better than last year. Oats, average area planted; best prospect for years; rye increased acreage; 10 per cent. better; potatoes and garden truck better than last year; orchard fruits prospect not good; grapes will be good unless the season should be too wet; hay, best for years if we can get sun enough to cure it; tobacco, an average crop will be planted. C. B. M.

GAINES' CROSS ROADS, Rappahannock Co.—We are just in the middle of wheat harvest; it is 90 per cent. better than last year. Corn, 25 per cent. better than last year; oats and rye 25 per cent. better; hay, 90 per cent. better; apples, 20 per cent. less than last year; garden truck, 10 per cent. better. C. B. W.

LEE, Goochland Co.—Owing to an almost unprecedentedly wet Spring, crops are all backward. All river-bottom crops seriously hurt, if not entirely destroyed by various floods in April. All corn on such lands had to be replanted; corn planting not yet done. Wheat earlier in the season promised a fair crop, but owing to ravages of the chinch bug it will be curtailed one-third. Upland grass exceptionally fine. No Timothy or clover on bottom land. Grapes alone of fruits promising well. Tobacco planting late, though, doubtless, a larger area than last year will be planted. On the whole, the outlook is exceedingly gloomy for farmers in this section. J. R. A., JR.

LOVELY MOUNT, Montgomery Co.—Crops of all kinds much better now than last year. Harvest will be 10 days to two weeks earlier. Wheat a fair stand and good heads, though some danger of rust owing to the continued rains for the past five weeks almost daily. Oats better than for five years past—heavy yield expected, though small acreage sown. Corn, large acreage planted—far advanced, though, owing to rain, not very clean. Clover abundant, damaged by lodging. Timothy bids fair to be very heavy. Apples good, in spots. Peaches, none. Potatoes, on small acreage, look well. Grapes more abundant than for years. Scarcely any rye. No barley. Pear trees full. Spring-sown grass a fine stand Everything too abundant for the farmers; prices very low. G. E.

MONTEITHVILLE, Stafford Co.—Corn, poor; wheat, 105; oats, very good; rye, 100; no barley; potatoes and garden truck inferior; apples, pears, peaches and other orchard fruits less than last year's crop; hay uncommonly good; tobacco promises well. J. O. L.

NORFOLK, Norfolk Co.—Garden truck, large crop, but low prices; potatoes nearly all sold; apples and pears very light; few peaches; corn about an average; what grass is grown is good; but little is raised; grapes, an average. E. E. B.

PEAKSVILLE, Bedford Co.—The condition of corn, compared with last year's crop, is about 80; wheat, 200; rye, potatoes and peaches about 100; apples, 85 or 90. Clover hay is plentiful, but the quality is injured by continued wet weather; none cut as yet and now two weeks behind. There will be very little choice Timothy hay this season, but a fair crop of second-class. Tobacco 20 per cent. less area, but condition far better; 90 per cent. of whole crop planted and living well. R. K.

WYTHEVILLE, Wythe Co.—Wheat is looking well and now being cut. On account of wet weather it may be a little damaged by rust. Last year not half a crop; ditto in 1884. Oats promise a good crop. Corn rather late, but looks well. Rye looks promising; two-thirds crop in 1885. Potatoes, promising with good season. Apples will be plentiful; large yield for 1885. Peaches, a fair yield; scarce in 1885. Grapes, promising; hay, a fair crop. Corn late on account of first planting being much destroyed by cut-worms. A good deal of grain destroyed by a severe hail-storm about May 15. W. H. R.

West Virginia.

CHARLESTON, Kerswha Co.—Corn, wheat, oats, potatoes, apples, pears, grapes, hay and tobacco—our principal crop—are all good. T. P.

KEYSER, Mineral Co.—Wheat is much better than for several years. Oats, very good; rye, very good; also potatoes, garden truck and fruits of all kinds. Hay only an average crop. R. M. W.

LITTLE FALLS, Monangalia Co.—Last year wheat was an entire failure, this year we will have far more than an average crop. Oats better than last year. Corn will be from one-quarter to one-third more than last year. Fruit will be also ahead. Berries and cherries in quantity. Potatoes and garden truck finer prospects by one-half at least. Grass one-third to one-quarter better than last year. J. M. J.

WEST, Wetzel Co.—Wheat more than double the crop of last year; area about the same. Corn good. Oats and grass look well, with a large acreage. Potatoes good. Tobacco nearly planted, with a large acreage. Barley, rye and root crops not much grown here. Garden truck good. J. H.

WELLSBURG, Brook Co.—Corn, average amount in ground, backward for time of year. Wheat, prospects better than for several years. Oats short and sowed; conditions favorable for the crop. Potatoes fine; prospect for a good crop. Garden truck, an abundant crop in prospect. Local hail-storms have done much damage to tender plants. Apples, short set of fruit, although a good bloom. Meadows very light and full of foreign growth. Rainfall in abundance. J. D. S.

North Carolina.

DOVER, Kent Co.—Corn looks well. Wheat excellent, much better than last year. Oats good. Rye excellent, but little raised. Barley none raised. Early potatoes excellent. Garden truck generally very good. Apples and pears abundant. Peaches, some orchards full, some but a few. Small fruits abundant. Grapes, prospect good. Grass excellent, better than last year. Tobacco, sorghum, hops, broom-corn, etc., none raised in this section. R. D. D.

HIGHLANDS, Macon Co,—Corn backward; fully a month later than an average on account of continued rains. Wheat good; harvesting begun, and crop fully up to average, and 100 per cent. better than last year. Oats and rye looking well and promising full crops. Potatoes better than last year—a full crop. Apples good; peaches none, buds all killed by cold spell in the Winter; grapes excellent; hay the largest crop ever known; clover exceedingly good; tobacco, the yellow-leaf variety being a staple crop in this region, is looking well, but is late and may suffer from an early frost. We have had the wettest season on record. rain every day for a month up to yesterday. H. S.

MOORESVILLE, Marshall Co.—We have had so much rain that crops are in bad condition. Cotton (our main crop) is backward and not a good stand; corn needs work but looks fine; oats, very fine: wheat, not better than last year; fruits of all kinds abundant, but droping and rotting badly; hay, especially clover, fine; but too much rain to save hay. S. A. L.

NEW BERNE, Craven Co.—Corn, 20 per cent. better; oats, better; potatoes and truck, short; fruit, not good. Cotton looks well, though some is dying. We are having too much rain. J. H.

RALEIGH, Wake Co.—The season has been excellent, and at present the crop prospect for the following must be at least 25 per cent. better than last year at this season. Corn, wheat, oats, rye, garden truck, apples, pears, peaches, hay, tobacco and cotton. The season has just suited cotton, and this crop was never better. If not subject to drought later in the season, crops will be better than in 10 years. J. N.

WOODSDALE, Person Co.—Corn, average better; wheat, three-quarters; oats, over an average; rye, barley, potatoes and garden truck, good. Apples, peaches and pears, an average. T. T. H.

South Carolina.

BLENHEIM, Marlborough Co.—The crops are an average acreage with the exception of hay; corn is very small yet, but promises well; wheat looks much better than expected in the Spring, will average about 20 bushels to the acre, throughout the section; oats look well, will be an average crop; potatoes good; apples an average crop; peaches and pears about an average; hay is light—three-fourths to one ton per acre. J. S.

Georgia.

AMERICUS.—Sumter Co. Not more than half an average crop of oats made. Corn shows average. Cotton not over three-fourths average, and very grassy. Irish potatoes, finest for years. Garden truck the same. Prospects for sweet potatoes very fine. The peach crop, I think will not equal early expectations, as at least half have either rotted on the trees or fallen off. H. W. S.

ATLANTA, Fulton Co.—Corn, 110; wheat, 40; oats, 85; potatoes and garden truck, 120; apples, 50; pears, 100; peaches late, 75; peaches early, 40; hay, 125; cotton, 75. W. C. A.

CAVE SPRINGS, Bibb Co.—Wheat with us is now ripe. Same area sown as last season. Grain poor; but with little over third of a crop. Oats usual area, full crop; heavy grain—the best in years. This crop not so good in middle and lower portion of the State; corn promising, but two weeks late. Cotton-plant healthy and vigorous, but small—two to three weeks late—Potatoes fine and large, but owing to continued rains, are rotting; sorghum good. Garden truck fully up to the average. Light crops of both pears and apples. A fine crop of grapes, but inclined to rot. Summing up the crop, we would put it down as fully up to last seasons, with the exception of wheat, 30.

GRIFFIN, Spalding Co.—Corn fully equal to last year's; wheat, a failure; oats, one-half crop; peaches, 60; apples badly injured by cold and insects. Grapes never had finer prospects, except that successive rains have brought on rot. Continued wet weather will destroy late cotton, but fine promise. Floods of rain S. W. M.

HARMONY GROVE, Jackson Co.—Corn 10 per cent. better than last year, area about the same; wheat, half a crop; oats and potatoes about the same; garden truck better. Outlook for apples, pears, peaches and other orchard fruits good. Sorghum a little better. Cotton, our main crop, is about 10 per cent. off, owing to cold rains. G. W. O'K.

Louisiana.

COTTONVILLE, East Baton Rouge.—Oats a poor crop. Corn looking fine, and a heavy crop assured. Cane doing well. Potatoes yielded poorly. Cotton is suffering from a three weeks' rain, and is badly in the grass and scalded out. All our crops are from two to three weeks late. R. G. B.

MONROE, Ouachita Co.—Corn good. Wheat, rye, barley, none. Few potatoes; these much inferior to last year. Fruit crop poor. Cotton 80. G.

Florida.

BOARDMAN, Marion Co.—The January freeze killed all the young lemon wood in this section, so there will be no fruit this season. The orange groves around Orange Lake will have perhaps two-thirds of crop, but away from the lake the crop is very small so that altogether there will be, say, one-half a crop. Oat crop very good, and corn also, and double the area of last year—will make nearly a supply. Vegetables plenty, but prices too low for profit.
F. G. S.

GREEN COVE SPRINGS, Clay Co.—The frost last Winter ruined most garden vegetables—melons are a month behind, only just commencing to ripen. There are but few peach trees set out yet besides native seedlings—such as Amsden, Alexander and Beatrice commencing to ripen the last of May and first of June. The orange trees were badly hurt with frost last January, and there will be no more than one-third to one-half a crop. Oats were good and cut first of June: corn is being hurt by drought. Rice looks well, cotton late and not much planted—we grow Sea Island altogether. Fruit trees of all kinds except the citrus are looking well and growing finely. J. M. M.

LAKE COMO, Putnam Co.—Oranges promise about a fourth of a crop. No lemons, or limes. Pecn-to and Honey Peaches good. Potatoes are just being set out. Garden truck poor. Watermelons a success.
R. W. G.

Alabama.

ATHENS, Limestone Co.—Crops are better than last year at this time, except cotton, there having been too much cool rains for it so far; but drier weather and a hot sun would bring it all right. Corn looks fine and is tasseling out. Oats are better than usual. Wheat is thin on the ground, owing to the hard freezes last Winter: but the berry is good, there being but little rust or other blights. Rye and barley not much grown. The average acreage of the above is more than last year. Almost every farmer has his small patch of sorghum, and it looks fine. Apples are an average crop. Peaches about one-half crop. Small fruits a fair average. Clover and hay crops are better than usual, the wet weather being in their favor. But few farmers grow them here, corn is our principal crop, and its blades are a general hay substitute, Garden truck is fair and plentiful. New wheat is selling at 70 cents; new Irish potatoes at 50 cents per bushel. W. M.

BIRMINGHAM, Jefferson Co.—Crops much better than last year at this date. Corn one-third; oats double; rye better; barley double; spring wheat one-third; clover and Timothy double. All garden truck one-third to double; Irish potatoes one-third; sweet potatoes double; apples one-third better; peaches short. Tobacco, broom-corn and sorghum I should think double. Cotton poor, but may come out. Grapes, tame and wild, are one-third better. A. W. P.

SELMA, Dallas Co.—Owing to unusually heavy rainfalls and high waters in all our streams, the prospects for good crops are anything but flattering. Late planting followed by so much rain as to prevent cultivation, has seriously delayed work on our principal crops, cotton and corn. Oats are usually sown in the Fall; what were sown were killed by January freezes, and the spring crop was light. Hay crop was good but not large. Compared with last year, the prospects are not as good for our main crops, cotton and corn. The sweet potato crop will be good. No grain raised except oats. Garden truck and fruits not much raised, although they could with profit. H. P.

Mississippi.

WEST POINT, Clay Co.—Prospect not so good as 12 months ago, three weeks rain has put all crops in grass and weeds. Corn, prospect poor; no wheat. Oats, poor crop. No rye or barley. Potatoes good; garden truck fine; peaches good; apples and pears poor; grapes good; no tobacco or broom-corn; sorghum good. I think a gloomy out-look general.
H. H. H.

Texas.

DENNISON, Grayson Co.—Corn, much better—never finer; oats 30 per cent. of last year, cut short by May drought; rye, one-half of last year's; barley much reduced by drought; potatoes, 25 per cent. of last year's crop; garden vegetables, 25 per cent. of last year's crop; strawberries and blackberries, about one-half last year's crops; apples, average crop; grapes, one-half usual crop set, but above average, from absence of rot, owing to dry weather; hay, one-half usual growth; cotton, never was better; sorghum, very fine. Cattle in excellent condition. Though the grass is short, yet it is more nutritious than in wet seasons, and fattens better. On the whole, our prospects are rather above the average, providing we have two or three more good rains in this and next month—July. It is very uncommon to have drought here in May or June. T. C. M.

EAGLE LAKE, Colorado Co.—Corn and cotton better than last year. Oats very good. Garden truck good. No wheat, rye or any small grain raised. Very little fruit.
R. B. D.

HILLSBORO, Hill Co.—Wheat harvested and thrashing 80 to 90 per cent.; oats, 50 to 60; rye and barley, very small amount sown; potatoes, 40; garden truck, 80; peaches, 25; hay, 60 to 70; cotton, 140 to 150, and increased acreage about 20 to 40; corn, 100. H.

LAURENCE, Kaufman Co.—Oat crop harvested now, 65; wheat, 75; corn tasseling, 90; sorghum, 100; cotton, 130; grapes, 150; apples, 130; peaches, 100; hay, 60: broom-corn, 80.
J. H.

MIDLAND, Midland Co.—Small grain a total failure; corn, very doubtful; sheep especially have done badly, one-fourth less wool clipped. J. S. C.

SHERMAN, Grayson Co.—Corn is looking finer than last year, though suffering for rain. Wheat not so good, averaging only 10 bushels to the acre; froze out considerably last Winter and suffered for rain this Spring. Oats are nothing to compare with last year, when they made all the way from 25 to 125 bushels per acre. Barley fair; average 35 to 40 bushels per acre. Potatoes and garden truck scarce—the worst outlook since I have been in the State, 10 years. Orchard fruits were mostly killed by late frosts. There will be considerable tame grapes. We raise nothing but wild prairie grass for hay; it will also be short for lack of rain at the proper season. Cotton far ahead of last year; in this neighborhood the prospect is magnificent; not much planted. Stock low; cows with calves at their sides are as low as $16, and not over $25. J. H. M'G.

New Mexico.

ALBUQUERQUE, Bernalillo Co.—All kinds of small grains average crops; oats, corn and orchard fruits, peaches excepted, good; grapes, the largest crop for five years. We raise not enough for home consumption. We need more and better farmers here. J. B. H.

Arkansas.

ARKADELPHIA, Clark Co.—Corn never more promising. Cotton good, with healthy plant. Oats below an average. Wheat and other small grains are also short. Strawberries injured from drought; raspberries injured from same cause. Peaches and apples only about half crops. The grape prospect is finer than ever before. V. M'G.

FAYETVILLE, Washington Co.—No barley, broom corn, hops, cotton or tobacco are raised to any extent in this section. Fruit-raising is mostly limited to apples and peaches. Corn, 90 per cent.; wheat, 65; oats, 70; rye, 65; potatoes and garden truck, 90; hay, 60; sorghum, 90; apples, 60; grapes, 50. A very dry spell in May and first of June cut down the per centage of wheat, oats, rye and hay. The quality is good, fully 90 per cent. We need more Rurals here, but oh, how hard to get them!
W. M. C.

SILOAM SPRINGS, Benton Co.—Corn prospects never better; wheat an average crop; oats cut short by drought; potatoes and garden stuff cut short by the drought; apples, prospect good; peaches none—killed in bud; small fruits injured by drought; hay and grasses cut short by drought. J. T. B.

Kentucky.

GRISSON'S LANDING, Daviess Co.—Corn, tobacco, wheat and rye in good condition and promise a good harvest. Wheat nearly all cut. Oats are short in straw on account of dry weather. Early potatoes will be short. Apples about the same as last year. Peaches and pears a failure. Hay about two-thirds of crop; clover hay about the same as last year.
M. G.

OAKLAND STATION, Warren Co.—Corn half eaten down by cut-worms; second planting up well and growing finely; outlook good; area average; old corn plentiful at 40 cents per bushel. Wheat, over average in yield; some fields extra heavy; some few not worth cutting, hurt by "fly" and rust; all cutting done; but it will be injured in the shock if this rain continues; been raining for a week; farmers would cut between showers, and consequently it was put up damp. Oats heaviest for years; down considerable; won't be cut till July 1. Rye and barley none planted. Potatoes fine, and gardens extra good; fruit a failure. Tobacco all set; good stand, but grassy, owing to rain. L. M. S.

PEWEE VALLEY, Oldham Co.—Corn generally good and forward. Wheat best for years. Oats short, owing to drought. Rye good. Potatoes suffered much from drought—same as last year. Plenty of fruit except peaches. Hay will be a short crop. Grapes more promising than last year. This year a good deal like last year so far. J. G. K.

Tennessee.

HOME, Greene Co.—Corn, prospect poor, continued rains prevented working; yield 33 per cent. below last year's. Wheat harvested, yield 50 per cent. greater than last year. Oats good crop, 25 per cent. better than last year. Grass and clover, good; potatoes and garden truck good; peaches, none; apples abundant; berries plentiful; tobacco promises fair, with an increase of acreage over last year. L. P. S.

HUMBOLT, Gibson Co.—Future outlook for crops was never better, with very few exceptions. Corn not quite so good, but looks well, wheat, 150; potatoes, 100; tomatoes, 105; apples, 50; pear, 25; cotton, 150; hay, 110.
M. C. R.

MCMINNVILLE, Warren Co.—Apples are the principal source of revenue. The indications are favorable for a much smaller yield than last season. Cotton, sorghum, tobacco, hay and Irish potato prospects unusually good—much better than last season. The wheat and oats are better than a year ago and will be over average crops. W. H. F.

TULLAHOMA, Coffee Co.—Corn, oats and rye, 120; wheat, 150; potatoes, 100; apples, pears, peaches and other fruits, 25. C. L. N.

WAVERLY, Humphreys Co.—Corn prospect fair; some damaged by rain. Wheat and oats better than for several years. Peanuts, a poor outlook; many fields almost ruined by excessively wet weather, commencing last of May and lasting yet. Peach trees greatly damaged last Winter; did not even bloom. Apples, light crop. J. W. S.

WESTERN STATES.

Ohio.

ATWATER, Portage Co.—Very dry since April until June 16 when it began to rain, and it has rained two-thirds of the time since then, and is raining now. Corn, acreage, 100 per cent.; condition, 100; wheat, acreage, 100; condition, 50; oats, acreage, 100; condition, 100; potatoes, acreage, 100; condition, 100; gardens are in good condition and clean; apples and pears, good crops, except Baldwin apples, which did not blossom this year as they were full of fruit last; peach trees full; last year none; hay a good crop. R. W.

BUCYRUS, Crawford Co.—Corn, better; outlook good if sufficient rain. Wheat two-thirds crop; some fields good; others medium; others very thin on the ground. Oats not as good as last year; rye same as last year; barley about the same as last year; potatoes half a crop as compared with last year; apples large crop; pears, good; hay half a crop. The crop of hay has been cut short by lack of rain. S. N.

CADIZ, Harrison Co.—Compared with last year, corn is about the same; wheat, many times better: oats not so good; potatoes about the same; apples better; pears scarcer; peaches plenty—a failure in 1885; orchard fruits generally plenty; grapes about the same; hay about half last year's; wool is by far the most valuable crop sold in this county; there will not be as much wool as last year: on account of short hay crop and low price of wool many sheep were sent out of the county. B. R.

CALCUTTA, Columbia Co.—The wheat crop is about 75 per cent. of full crop; corn, 120; oats, 100; rye, 100; potatoes, 100; garden truck, 100; apples, 50; pears, a total failure; peaches, 50; cherries and plums, full crops; hay, 50. Meadows full of sorrel and white-top weeds.
J. S.

COLUMBUS, Franklin Co.—All crops are a week or 10 days earlier than last year. Corn is good, equal to last year; wheat, much better; will be 400 or 500 per cent. greater on account of being almost entirely frozen last year; oats fair—about an average; not many grown here; rye, little if any grown; barley, fair average; not much grown; potatoes and all vegetables promise to be abundant crops; apples promise well; pears only a fair crop; peaches not grown to speak of; grapes not grown; hay, very poor, not half a crop, except clover, which is very heavy; Timothy meadows scarcely worth cutting. W. B. A.

DAYTON, Montgomery Co.—A heavy crop of fall barley is just harvested. Wheat will be ready in a few days—a magnificent crop too—after the complete failure of 1885, when from 80 acres I did not get seed back. Corn is doing finely; though there does not seem so much put in as usual. There is much spring barley too, and everything most promising. We are having wet weather for clover cutting. Clover is very heavy, as an offset for last year's failure. Broom-corn has been a regular crop with us until lately; this year we try it again, but it is too soon to tell of it; there is usually a considerable quantity raised hereabout. Tobacco also is a good crop in the Miami Valley. My crops never promised better. H. R.

HUDSON, Summit Co.—Wheat as good as last year, late. Some corn better than a year ago and more planted. Potatoes looking fair; more than as many again planted than a year ago. Oats looking fair; hay crop will be short; fruit about half crop. E. A. S.

LONDON, Madison Co.—Corn not so good as last year, but we expect a fair crop; last year's was extra. Outlook for wheat has not been so good for four or five years. Last year it was only two bushels to the acre; this year it looks as if it would average over 20. Not much oats or rye sown in this section. Oats are too rank. Hay heavier than last year. Potatoes and garden truck several weeks earlier and better than last year. Apples, peaches and grapes are in abundance; have not had so large an acreage for years. The army-worm has done much damage to the hay crop. H. W. L.

OXFORD, Butler Co.—Season very favorable; pasture good; wheat harvest began June 16th. The season promises to be a very fruitful one. As compared with last year, corn is 100; acreage, 100; wheat, 95; acreage, 95; oats, 75; acreage, 80; barley, 105; acreage, 75; potatoes, 100; acreage, 75; apples, 110; pears, 40; grapes, 100; hay, 90. W. B.

PLEASANT HILL, Miami Co.—Wheat will average about 18 bushels per acre. Corn, not so good as last year, will average about 45 bushels to the acre; oats will make an average crop, about 50 bushels to the acre; barley, 40; rye, 18; potatoes, about half a crop. Hay a fair crop, about two tons to acre. Most fruit good, such as apples and grapes, peaches, plums and so on. W. H. L.

RAVENNA, Portage Co.—Late rains have improved appearance of crops: wheat, 90 per cent. of last year's; oats, 50; corn, 100; potatoes look splendid; rye, but little sown, looks very well. G. P. T.

ROCKPORT, Cuyahoga Co.—The general outlook for corn is far ahead of last year; wheat is the best for years; oats are looking well; rye looks well; potatoes looking well, but feel the need of rain; apples promise largest crop for years; peaches very scarce, not more than half a crop. W. C. E.

TIFFIN, Seneca Co.—Corn is farther advanced by 50 per cent. and has much better color than at this date last year; wheat not favorable for an average of over half a crop; oats extremely short in the straw; hay, clover hardly an average crop and is being cut at least 10 days earlier than usual; apples, only half a crop; peaches, half a crop. T. G. B.

TONTOGANY, Wood Co.—Corn better than last year; wheat, about the same: oats, ditto; rye and barley but little raised here; early potatoes and garden truck injured by drought; Orchard Grass better, clover good, Timothy hay light. N. K.

YANKEE RIDGE, Coshocton Co.—Early planted corn looks well, prospects are good for an average crop; wheat is a little above an average, some Fultz already in shock; oats very short and will be a light crop; rye, none raised to speak of; barley, none raised; potato prospects slim on account of drought; garden truck where tended to is as good as common; apples, prospect never better; pears a failure; peaches, seedlings plenty, budded ones none; cherries, best crop for 20 years. All kinds of hay crop very light on upland; clover is very good on the bottoms. J. H. D.

Indiana.

BOURBON, Marshall Co.—Last year nearly all of our crops were half short. The fly is now working badly in wheat, and some was drowned out. Prospect, wheat, 75; oats, 110; corn, 100; potatoes, 90; garden truck, 100; apples, 125; cherries, 125 for Richmonds; others of little account; grapes, 100; hay, 85 for Timothy, and 100 for clover. The general condition of all small fruits as well as of field crops is the most promising. J. H. P.

BRIDGETON, Park Co.—Corn looks well; wheat about an average crop; oats, average; rye and barley, none; potatoes, a large crop; fruits generally not very good; hay, light crop. P. F. A.

COLFAX, Clinton Co.—Corn poor; wheat good, never was better filled; oats good; Timothy hardly as good as last year; potatoes look fine; garden truck about the average.
G. A. R.

COLUMBIA CITY, Whitley Co.—Wheat is 10 per cent. below last year; corn about the same; oats not so good; potatoes about the same as last year; garden truck the same average; apples will be an average crop; grapes the same; clover is a good average, but Timothy will be about two-thirds of last year's crop W. A. L.

EVANSVILLE, Vanderburgh Co.—Wheat, 120; corn and oats, 95; rye, barley, potatoes

and tobacco, about the same as last year, while hay and special crops will be better. G. G.

GREENSBURG, Decatur Co.—Corn, an average area; looks 20 per cent. better. Wheat average, seeded better than last year. Oats never better. Rye and barley little raised. Potatoes as good as we ever had. Apples 25 per cent. better than last year. Pears same as last year—full. Cherry trees full; grape vines full. Meadows and Blue Grass pasture as good as we ever had. Broom-corn and garden truck good. All crops two weeks earlier than usual. W. W. H.

GREEN OAK, Fulton Co.—Wheat is 10 per cent. better than at this time a year ago; oats, 15 per cent. better; corn, 20 per cent; potatoes, a larger acreage; condition good. Sorghum, larger area, condition good. Rye good. Fruit earlier. Garden stuff good. W. H. K.

HAW PATCH, Lagrange Co.—Wheat, 80; corn, 125; oats, 75; clover seed, 200; clover hay, 50; Timothy hay, 75, short, want of rain early; potatoes, 115, beetles few; apples, 115. J. N. L.

LA FAYETTE, Tippecanoe Co.—Corn not as good as last year. Wheat, 20 per cent. better. Potatoes and garden truck about the same. Orchard fruits and grapes at least 50 per cent. better. Hay crop will not be as good by 25 per cent. H. B. B.

LANESVILLE, Harrison Co.—Wheat is very heavy. Oats and grass will be very heavy, and there is a fine prospect for a good crop of corn. Potatoes promise a heavy yield. Grapes are rotting badly in consequence of the rainy weather. We have had heavy rains, and the outlook is gloomy. If the rainy, foggy weather continues, I fear we cannot save our crops. It is damaging wheat and oats badly. Fruit crops will be light. J. E. W.

MONTMORENCI, Tippecanoe Co.—Corn and oats, good; potatoes and garden truck, average—better than last year; apples, grapes and plums, better; no peaches; pear trees nearly all dead; hay, very good, and wheat is better. S. E. S.

MUNCIE, Delaware Co.—Corn quite late, and outlook not good; wheat, good, much better than an average; oats good, better than average. Potatoes very promising; garden truck good; apples, very promising; grapes, abundant; hay, Timothy, short, two-thirds last year's, clover good. P. C. H.

POPLAR GROVE, Howard Co.—Corn, 110; wheat, 95; oats, 85; potatoes and garden truck, 100; apples and pears, 125; grapes, 150; hay and clover, 100; Timothy, 85; sorghum, 80. W. M.

ROCHESTER, Fulton Co.—Corn, 100 per cent; wheat, 90; rye, 90; oats, 110; potatoes, 105; apples, 65; grapes, 90; garden truck in great abundance. R. D.

SPRINGPORT, Henry Co.—Wheat, 100; corn, 80; oats, 80; potatoes, 75; garden truck, 90; apples, 100; pears, 40; grapes, 100; hay, 99; sorghum, 100. W. H. V.

WINCHESTER, Randolph Co.—Crops will average about the same as last year, with the exception of Timothy, which will be almost an entire failure. W. A.

Illinois.

ALTONA, Knox Co.—Wheat good, oats average, vegetables fine, corn average, small fruit abundant, rye good, apples scarce, grass good, potatoes good. B. M.

ANNA, Union Co.—Wheat cut and in shock; will be stacked next week if weather permits. As compared with last year, acreage 110 per cent.; yield apparently 125 per cent. Clover cut and stored two weeks; acreage probably as last year; yield and quality probably about 80 to 90 per cent.; second crop in many cases promises to be ready in two weeks or less, and bids fair to make better hay than first crop. Such was the case last year. Timothy or Red Top not yet cut, except as in my own case, dominated by volunteer clover, and cut immature to prevent loss of clover. Oats, yield, 130 to 140 per cent.; acreage, 115 to 125 per cent. Corn, acreage, 100; condition, 100. Strawberries, yield simply tremendous, so much so that growers lost money; while pickers (at two cents per quart), transporters (R. R. or Exp. Co's), commission men and retailers in market, as well as consumers, divided the swag. Potatoes, early, acreage 125; promise 125; only a few late cultivated. Sweet potatoes, owing to low prices for last several years, only a small comparative acreage, say 40 to 50; look well. Apples, except Early Harvest or Red June, about as abundant as last year; and the trees were loaded last year, and the fruit remarkably free from blemish and of attractive appearance and quality. But thousands of bushels rotted because there was no demand at home or in the cities of St. Louis or Chicago. This was notably the case with summer and fall apples, which had in other years brought fair prices. J. M. F.

AURORA, Kane Co.—Fall grain good; Spring grain fair; corn fair; grass a good average; pasture good; season is 10 days earlier than usual; fruit good, all kinds. F. C.

BONDVILLE, Champaign Co.—Corn 100; wheat good, small acreage; oats 100; potatoes 100; garden truck good; apples 100; hay 100; sorghum 80; broom-corn 95. H. B. G.

CHAMPAIGN, Champaign Co.—The season has been a very favorable one from the start, both in respect to the weather, which has been relatively dry and cool, and the condition of the soil that a cold and rather frosty Winter put in the best condition for the crops. Winter wheat came through uninjured, and so of grass and clover. The first is equal in yield and quality to the great wheat crop year, 1882, but the acreage is very small, not half of the average of the past five years. The harvest is going on in the latitude of St. Louis, a week or 10 days earlier than usual. Cool and dry weather favored the seeding of oats and the plowing and planting of corn. A drought from the middle of May to about the same date in June prevailed quite extensively and shrank oats, late sown, a good deal. However, as warm and mellow rain came on the 13th, the oats were saved from serious disaster. Of corn, there is nearly a full stand, an enormous acreage, and the fields are clean, and the crop is now, for latitude 40, fully knee-high, and with 20 per cent. up to a man's hips, and the promise, if the weather is that of the average last half of June, that these fields will be showing tassels and silk by the Fourth of July—a very unusual and remarkable circumstance. In short, if the summer season keeps its early promise up to the first of September, no more magnificent corn crop will have been made in the Northwest since the phenomenal corn crop years of 1860, 1872 and 1880. Pastures are good; hay fair in some places, and enormous in others. Potatoes are suffering from the Colorado beetle, and cabbages from the European butterfly. The apple crop does credit to the even-number-year notion, and pears are making amends for the failure last year. The drought from the middle of May to that of June may be regarded as a special providence, since it was succeeded by warm and copious rains, and I shall expect to see a repetition of these providences till the crops are all made. B. F. J.

CLARENCE, Ford Co.—Corn about two-thirds, oats half; no rye sown. Barley and potatoes average; garden truck and apples about the same as last. Hay not as good. Flax average. W. S. S.

DOVER, Bureau Co.—As compared with last year, crops are somewhat in advance. The weather has for the most part been favorable to rapid growth of all cereals. Apples are doing well; small fruit of all kinds are abundant. Potatoes and all garden truck promise well. Grass abundant. T. W. L.

FREEPORT, Stephenson Co.—Corn, 70; wheat, 120; oats, 60; rye, 125; barley, 90; potatoes and garden truck, 50. J. R. W.

GEORGETOWN, Vermillion Co.—Corn about the same as last year. Wheat, one-half more. Oats, the same as last year. Rye, one-third more. Potatoes, one-third better; garden truck the same. Apples and pears, one-third more. Grapes, two-thirds more. Hay, one-fifth better. Sorghum the same. Raspberries, currants and gooseberries the same as last year. Blackberries, one-half better. H. E. H.

GURNEE, Lake Co.—Corn, oats, potatoes and garden truck average with other years. U. D. W.

HIGHLAND, Madison Co.—Wheat all cut; the last three weeks it was badly damaged by the chinch-bugs. A good many corn-fields are now being destroyed by these insects, and we are afraid that the corn crop failure of 1881 will be renewed this year. The same area has been devoted to sorghum cane as last season. The condition of rye and barley is fully up to the average, but the growing crop of oats is backward and does not promise more than a three-fourths yield per acre. Meadows and pastures are doing well and are farther than usual for June 12. Small fruits are in fine condition and will yield a large crop. The percentage of bloom this spring and the condition of fruit June 12, as compared with an average, is as follows: Apples, condition, 96; peaches, 40; pears, 90; plums 100; cherries, 83; grapes, 100; currants, 100. O. Z.

ILLINOIS CITY, Rock Island Co.—Wheat two-thirds of last year's crop; oats less than half; rye and barley about three-fourths; sorghum and corn look as well; potatoes look better, but need rain; garden truck suffering for rain. Currants and gooseberries full crops; strawberries, raspberries and blackberries cut short by drought. Cherries nearly full crop; fair last year; plums not half crop; fair last year. Apples about nine-tenths better; grapes about nine-tenths better; clover a full crop; Timothy cut short about one-fourth. T. H.

KANKAKEE, Kankakee Co.—Corn, 100; wheat, 75; oats, good; rye, good; potatoes, 100; garden truck, extra good; apples, good; hay, good. T. C. D.

MORRISONVILLE, Christian Co.—In comparison with same date last year, corn is 70 of a crop; Winter wheat, 500; oats, 60; rye, 100; potatoes, etc., 100; apples, 100; grapes, 120; hay, 75; small fruits, 100; pastures, 100. Stock looks well; enormous increase in poultry. Average number of calves, colts and pigs. Not enough wheat was harvested in this county last year for seed and bread. Fair breadth was sown last Fall; looks splendid; will yield heavily. Harvesting begun. Oats and hay short on account of drought. Very early oats good. Clover fine; 40 per cent. of corn injured by terrible storm May 14, and birds. Much replanted late. F. G.

POLO, Ogle Co.—Corn, oats and hay are two weeks earlier. Prospects good for more than average crops. J. F. B.

RIDGELAND, Cook Co.—Corn, splendid; oats and rye, good; of wheat we have none around here; potatoes never better; cabbage, good; have not been troubled with catterpillar this year; garden truck, good; hay, a good average; small fruit very good, R. A.

RIDGE FARM, Vermillion Co.—Corn, prospects flattering; average acreage, never better; wheat acreage 75 per cent of 1885; estimated average yield, 15 bushels per acre, against five bushels in 1885; oats estimated at 25 bushels per acre; three-quarters of 1885; rye, acreage small; estimated at 10 bushels per acre; potatoes one-quarters larger acreage than in 1885; prospects very good; hay light, owing to dry weather early in season; apples, grapes and small fruits abundant; taken altogether, our prospects were never better. B. H.

ROSEVILLE, Warren Co.—Average, present condition and future outlook as compared with last year, corn, 50 per cent. better; wheat, 20 per cent. better; oats, on account of dry season since May 15, 20 per cent. worse; rye and barley about the same; potatoes planted early will be better, can't say about late planted; garden truck, 25 per cent. better; apples, will be scarce; hay, prospect fine so far, suffering now for rain. General prospect good and farmers happy. C. F. G.

SPRINGFIELD, Sangamon Co.—Corn about an average, prospect good; wheat and oats look splendid; three times more of wheat than last year. Oats somewhat better. Rye good; not much sown. Potatoes and garden truck double the crops of last year. Apples last year none; prospect for fair crop now. Pears about an average. Peaches same as last—none. Grapes, a large crop. Hay about the same as last year. J. F. F.

Michigan.

ALBION, Calhoun Co.—Compared with last year's crops, corn is 100; wheat, 70; oats, 75; potatoes and garden truck, 100; apples and pears, 125; peaches, none raised; small fruit, 110; hay, 80. L. M.

BAY CITY, Bay Co.—Crops as compared with last year are as follows: Corn, 100 wheat 75; oats, rye, barley, potatoes, garden truck, apples and pears, 100. Peaches none; grapes, 100; hay, 75. An abundant crop of strawberries. A. M.

BUCHANAN, Berrien Co.—As compared with crops at this time last year, corn is about the same. Owing to drought, wheat and hay will be a little short. Grapes ahead; small fruits generally about average crops. E. S. R.

CLIO, Genessee Co.—Corn, usual area; wheat usual area, two-thirds of a crop; oats usual area, 100; potatoes, average area; garden truck usual average; apples, 150; but little other or hard fruit is raised, but promises 150; hay, two-thirds of a crop; peas, 50; greater area; promise well. D. S. H.

EAST PARIS, Kent Co.—Calling last year 100; corn, 75; wheat, 80; oats, 50; potatoes, 80; garden truck, 75; apples, pears and grapes, 100; hay, old meadows, 50; new seeding, 75. On account of severe drought all crops are likely to be short. Haying two weeks earlier than usual—wheat maturing very fast. C. T. F.

GRAND RAPIDS, Kent Co.—Drought very severe and affects some crops seriously, in our vicinity. Wheat, 85; corn, 90; oats, 45, rye, 90; potatoes light; garden truck shortened by drought. Apples, 90; pears, 65; peaches far better than last year; grapes abundant. Hay less than one-half crop. C. W. G.

HAGAR, Berrien Co.—Wheat, average crop. Corn looking well. Oats light crop. Potatoes, a large acreage planted; looking well. Hay very light. Apples better than the average. H. N. S.

HOBART, Wexford Co.—Hay a failure; for 50 days we have had no rain sufficient to wet the ground half an inch. Potatoes are looking fairly well where they were not cut by the frost. A very dry and frosty season, thus far oats looking bad; will not make more than half a crop; wheat is not making much straw; will probably head very low; crop below the average probably. Not much corn raised; what there is is looking very well. Grapes and currants have been pretty generally nipped by the frost. No apples as yet in this section; all garden crops are nearly at a standstill on account of the drought, and unless we get a change very soon, it will be difficult to get a living on the farm in this part of the country. W. H.

IONIA, Ionia Co.—Wheat an excellent crop. Oats injured by drought, but recent rains will help them; probably two-thirds crop. Barley the same. Potatoes coming on finely; not so many planted. Apples a very full crop. Small fruits abundant and market glutted. Grapes very promising; no rot here last year; we look for none this year. Pears promising. Few peaches; trees killed two years ago. On the whole, outlook good. R. M. K.

MENOMINEE, Menominee Co.—Compared with crops at this time last year, the outlook is: Wheat, 125 per cent.; oats, 100; rye, 110; potatoes, 110; apples, (Duchess) 125; hay, 120. M. N.

MUSKEGON, Muskegon Co—Corn good; wheat good; rye good; oats and barley fair; garden truck fair; apples full crop; hay, 25 per cent. J. E. R.

OCONOMOWOC, Waukesha Co.—Corn, fair; oats, fair; rye, fair; barley very poor; potatoes poor; garden truck fair; apples fair; pears, none; peaches, none; berries of all kinds fair; grapes fair; last year's seeding of clover good; old meadows all poor, but marshes; sorghum fair; hops good. S. F. G.

PIERPORT, Manistee Co.—Corn looks very well now; oats, 75; rye, 75; barley, 50; potatoes, 50; garden truck, 60; apples, 100; pears, 75; plums, 50; hay, very light, except new seeding meadows near lake shore. P. C. M.

ROCKFORD, Kent Co.—The present condition and future outlook of all crops grown in this section, such as corn, oats, wheat, potatoes, apples, peaches, cherries, hay and garden truck compare well with the same crops at the same date last year. Corn never looked better; wheat, ditto; potatoes, the specialty in this section, are looking fine and bid fair for a big crop, although the potato beetles have made their appearance in large numbers, but farmers know how to manage them, so we don't fear them. J. L.

SILVER CREEK, Cap Co.—Wheat, 95; corn, 125; potatoes, 75; oats, 50; apples, 100; clover fair, but Timothy suffered from the drought. J. M. F.

SOUTH HAVEN, Van Buren Co.—Apples, pears, plums and cherries, about as last year. Peaches will be a full crop. Away from Lake Michigan the crop will be light. Small fruits of all kinds are showing heavy crops. Grapes, at present, promise much better than last year. T. T. L.

ST. CLAIR, St. Clair Co.—Corn, 133⅓; wheat, 60; oats, 90; barley, 80; potatoes, 100; garden truck, 80; apples, 110; pears, 75. W. A. T.

Iowa.

CAMPBELL, Polk Co.—Wheat and oats will prove over half a crop; corn looking well but rather backward; potatoes looking nice; bugs are plenty; very little rye or barley raised here; clover very heavy: Timothy, fair crop; prairie grass also fair; apples midling, as are also plums. R. C. S.

CANFIELD, Hawk Co.—Corn, 150; oats, 50; rye, 120. Potatoes and garden truck the same; orchard fruits, 150; hay, 50. A. C. F.

CORNING, Adams Co.—Corn, 110; wheat, 100; oats, 100; potatoes, 110; garden truck, 100; apples, 50; grapes, 150; hay, 90; sorghum, 100. J. S.

COUNCIL BLUFFS, Pottawattamie Co.—Spring wheat, acreage has decreased four per cent; condition 98½ per cent; estimated yield 29,120,000 bushels; winter wheat, area very small, but condition 106 per cent; corn, increased acreage 5½ per cent; condition 101 per cent; oats, increased acreage 7 per cent; condition 101 per cent; flax, decreased acreage 4 per cent; condition 97 per cent; Timothy, increased acreage 10 per cent, with a condition of 105 per cent; clover, increased acreage 8 per cent, with a condition of 106 per cent; the crop of tame hay will be the largest ever known; potatoes, increased acreage 6 per cent; condition 100 per cent; sorghum, 5 per cent. decreased acreage, with a condition of 91½ per cent; garden truck of all kinds looking well and very early. Have had new potatoes and cabbages home-grown in market two weeks; raspberries and blackberries are suffering for rain; otherwise the crops would be immense; grapes are looking fine; my own vineyard gives promise of 10,000 pounds per acre; apples, a fair crop. A. W.

DAVENPORT, Scott Co.—Barley, 75; wheat, 80; oats, 60; corn, 75; potatoes, 50; meadow, 90. C. W. L.

DUBUQUE, Dubuque Co.-We have had no rain for over four weeks, and oats and wheat look bad: corn has been planted twice in many cases, but holds its own; hay will be but half a crop; potatoes will be short if no rain comes soon; strawberries less than half a crop; raspberries are full of blossoms and buds, but will be short of half a crop; grapes did look well in blossom, but it being so dry lots of the blossoms are blighted; grass in pasture is poor for stock; everybody praying for rain. H. R.

EDDYVILLE, Wafello Co.—The average yield of corn, oats, spring wheat, potatoes and garden truck will be very much below the average of last year, on account of drought for the past three weeks and too much rain in April and the first half of May. Winter wheat, rye and hay may be average crops compared with last year's. D. D. M.

EMERSON, Mills Co.—Corn prospect good; wheat and oats light; rye good; potatoes and garden truck fine; apple prospect good; pears and peaches, none; hay good; crops 10 days to two weeks ahead. Prices: corn, 16 to 18 cents; wheat, 40 to 50 cents; oats, 20 cents; butter, 7 cents; eggs, 7 cents; hogs, $3.35. W. G.

GRUNDY CENTER, Grundy Co.—Corn is in better condition than last year, and is earlier; wheat is not raised in this section; oats look well, but the straw will be short because of a very wet Spring and a very dry spell since; barley is good on upland, but short on low land; potatoes look well, but it is too dry for a full crop; garden truck is ahead of last year, and less weeds than usual; hay an unusually heavy crop; raspberries, blackberries, grapes, cherries, currants, strawberries, etc., are good crops; orchards nearly all killed out. Haying has already begun; some are finishing their corn plowing, and barley harvest will soon hurry everything along; oats are heading; everything earlier than last year; prospects good. J. L. B.

HAMBURG, Atchison Co.—Corn, average better, acreage smaller; Wheat, average not so good, acreage about the same; oats average good, acreage larger; rye, average good, acreage smaller; barley, average poor, acreage about the same; potatoes and garden truck about the same; apples, present prospect about half crop; hay, one-half better than last year; sorghum about the same as last year. A. M.

LE MARS, Plymouth Co.—Wheat, oats, barley, flax, potatoes, etc., are all doing nicely, and are a week or 10 days in advance of last year, with good prospects of much better yield than last year: should think from 10 per cent. to 15 per cent. advance. M. V.

NEW SHARON, Mahaska Co.—Corn is about an average; wheat and oats light and short; hay, average; potatoes and garden truck, poor; apples and grapes, light. J. L. H.

RENWICK, Humboldt Co.—Corn prospects the best for five years; pretty dry for wheat, oats and potatoes; gardens that are well tended are good; small fruits good; no apples; Timothy and clover light; wild grass is our principal hay; barley fair. O. E. F.

ROCK FALLS, Cerro Gordo Co.—The acreage of corn is somewhat less than last year, but it is fully two weeks ahead of the corn last year. Wheat and barley well, and there is more sown than last year. No rye is raised around here, and there is less flax sown than for several years past. Oats is the principal small grain grown in this section, and the outlook is as good as the average. Potatoes look well, but the bugs were never so numerous. Garden truck looks about the same as last year. There are but few apples or other orchard fruits. Hay is better than the average, and the acreage has been increased a great deal the last year. W. W. W.

UNION, Hardin Co.—As compared with last year, the average condition is as follows: corn, 100; clean and well worked; wheat, 75; straw, short; oats, 50; rye and barley, none; potatoes and garden truck, average crops; hay, somewhat shorter from lack of rain; sorghum, a full average crop. A. A. L.

Wisconsin.

ARCADIA, Trempealeau Co.—Corn, 80 per cent.; winter wheat, 90; spring do., 75; oats, 80; rye, 90; barley, 80; potatoes and garden truck, 90; apples, 50; hay, 80. G. C.

BELOIT, Rock Co.—Corn looking well; oats, good; barley and rye, good and larger quantity sown than in '85; potatoes not looking well; fruits, except cherries, fair; tobacco, just being planted, not so large an acreage by about one-third, as last year; hay, a large crop. B. C. H.

CASCADE, Sheboygan Co.—No rain since May 1, with the exception of a couple of light showers, scarcely enough to lay the dust. Corn planted over five weeks is drier than when planted. Not one-third of the usual area of corn planted; pastures are as if a fire had run over them; hay, new seeding, fair; old would hardly pay for cutting. Winter wheat and rye about the usual area, a good stand, all getting dried up. Spring wheat over an average—about worthless at present; barley about the same as last year, heading out a foot high and yellow; some fields worthless; oats in the same condition; potatoes stand the best; apples good: cheese, 6 cents; butter, 10 cents. If rain doesn't come soon, all crops will be failures. G. F.

EAU CLAIRE, Eau Claire Co.—Corn is better than last year, and as much was planted. Oats, wheat, rye and potatoes look well. Garden truck earlier and good. Hay on old meadows very light; on new seeding, not over half a crop. But few apples; no pears or peaches grown. Very dry; unless rain comes soon, all will be changed. H. H.

GREEN BAY, Brown Co.—Corn has a good stand; wheat, oats, rye and barley, favorable with last year; potatoes and garden truck, good. Apples much ahead of last year, together with small fruit; also wild fruits promise good. Grapes are setting well. Hay in old meadows is about half a crop; late seeded meadows are a little better. The average is a little more than half of last year's. Stock looks well. Season eight or ten days earlier than last year. T. B.

GREENBUSH, Sheyboygan Co.—The grain crop in this section, as compared with last year, is very poor. Late frosts spoiled the apples and cherries. Pears, peaches and grapes are not grown here to any extent. Corn and sorghum may be half crops. Pastures, except on low land, are all dried up. Potatoes and garden truck are far below the average. A. M. S.

LAMARTINE, Fond du Lac.—Grain of all kinds has but little growth as compared with last year; but looks favorable for as good a crop; hay is short on old meadows. Garden truck about the same as last year; fruits of all kinds look as though they might be average crops. C. S. N.

LIVINGSTON, Grant Co.—Corn is good, and will probably exceed that of last year by 15 or 20 per cent; wheat, small in acreage, quality equal to last year's; oats, short in straw, equal to 100 per cent. in grain; potatoes, early, less 25 per cent.; late, 100 per cent.; apples, but few; peaches and pears, none; grapes on upland, full crop, and all small fruits good; on low land badly injured by late frost. W. F.

MARSHALL, Dane Co.—No rain since April 16 Crops look about as well as they did last year at this time. Wheat, oats, barley, rye, potatoes and all garden truck not half crops, on account of the drought. No tobacco set out yet. Not over a third of a crop of hay. Cherries almost a failure. Sorghum poor. No apples to amount to anything. Cheese, six cents a pound, and butter 12½ cents. R. C.

MONROE, Green Co.—Corn, 114; wheat, 100; oats, 90; rye, 75; barley 80; potatoes, 110; garden truck, 110; clover hay, 100; Timothy hay 80. H. H.

NORTH GREENFIELD, Milwaukee Co.—Corn, wheat, oats, rye, and barley, good. Potatoes, early, good, late coming on, too dry. Garden truck good, but late. Apples good; cherries good. Hay crop first-rate. A. L. S.

OMRO, Winnebago Co.—Corn a full average; spring wheat, oats and barley 50 per cent.; winter wheat an average; hay about 40 per cent. of a full crop; potatoes 50 per cent. No apples last year. Small fruits a full crop. Have had two months' drought; first rain last week. Wool from 22 to 29 cents. E. R. N.

PORTAGE, Columbia Co.—Early planted corn compares well with last year's crop; late planted failed to get up on account of a drought; now in the sixth week; wheat and oats will be very short in straw and grain. Rye must be a poor crop, as it has been filling during this heated term; barley not raised; potatoes and garden truck look well where they have been well tended; orchard fruits will be light, on account of late frosts; hay will be very light. Many pieces of above are too short to cut. D. B. P.

RIPON, Fond du Lac Co.—We are having the severest drought we have ever known. Outlook for all kinds of crops discouraging. Pastures and meadows suffering for want of rain. With the most favorable weather, crops will be very light. N. M.

SAMEM, Kenosha Co.—Wheat looks unusually well; sorghum, good; corn, oats, rye, barley, potatoes and garden truck withered for want of rain; hay, extra heavy. R. H.

SHEYBOYGAN FALLS, Sheyboygan Co.—The dry weather has pinched crops severely. The growth of straw will be less; so will that of hay. Corn hardly up yet. Apples a double crop; small last year. Pastures dried up. Not as much milk as last year. F. H. P.

TOWN OF HERRUSON, Calumet Co.—Crops for this part of the country are little or no better than a year ago. Winter wheat and rye full crops, not much sown. Spring wheat about two-thirds of a crop. Barley one-half a crop. Oats, three-fourths of a crop. Potatoes and garden truck suffered for want of rain. Hay, one-half a crop. P. H. L.

WEST POINT, Columbia Co.—Corn, 110; winter wheat, 115; oats and barley short. Potatoes fair. Hay very short. B. M. S.

Minnesota.

CAMPBELL, Watkins Co.—Future outlook as compared with last year, we think about 15 per cent. better. Crops raised are wheat, oats, rye, barley, potatoes and garden truck, hay, etc. N. N. T.

HASTINGS, Dakota Co.—The early Spring was unusually favorable for seeding and planting. A very severe drought in May continued until it nearly ruined meadows and late-sown grain. At present the outlook may be summed up as as follows: Wheat, no hope for more than one-half average crop; oats, somewhat better, perhaps two-thirds crop; corn, all that sprouted before the dry time (and that is most of it), promises to be much better than the average, say 125; rye good; barley poor; potatoes, never saw them looking better; hay, about 60 per cent. of average crop. Chinch bugs innumerable. Every creeping pest possible is let loose upon us. W. G. L. D.

JANESVILLE, Waseca Co.—We had a wet April. Crops were put in when ground was in poor condition. May was dry, but we expect fair average crops of grain. Grass is good. Fruits are fair. A. P. W.

MANKATO, Blue Earth Co.—Corn, good; wheat, 75; oats, good; rye, light; barley, good; potatoes, good; tame hay, very light; flax, good. H. C. A.

SAUK CENTER, Sterns Co.—In the latter part of May, a severe drought began, and continued until about the middle of June, which seriously injured the crops. As compared with last year, there will be a decrease of one-third; the corn and potato crops may be much improved by future favorable weather; but wheat, oats, and barley are too far advanced to be greatly changed now. Hay is generally a light crop. This section is not much given to fruit raising. I. C.

WASECA, Waseca Co.—Corn better than last year; wheat fully as good; oats and barley about the same; potatoes, fair; strawberries hurt by the hot, dry weather; other small fruits as good; apples, very few raised here; hay, good. D. P.

WINONA, Winona Co.—The outlook for crops is decidedly unfavorable, with the exception of corn, which never looked more favorable. Wheat, oats and barley are short and thin—not more than half crops. Hay very short and thin—all for the want of rain. Have lived for 21 years in this county, and never saw as little rain in April, May and June. E. T. H.

Missouri.

AFTON, St. Louis Co.—Wheat, not much raised, but what there is of it is good. Oats, grass and clover, abundant. Early potatoes a full crop. Corn in good condition. Fruits, average crops, except peaches—all killed. Grapes rot badly, except those growing on poor land; Virginia Seedling free from rot. P. M.

BETHANY, Harrison Co.—Wheat acreage always small; 50 per cent. increase over last year; prospects 50 per cent better. Corn fully as good as last year. Oats very badly injured by drought; rye good; apples good; hay short, on account of drought. S. W.

BLUE SPRINGS, Jackson Co.—Corn is 25 per cent. better. Wheat an average crop. Rye, not grown here; barley not grown. Potatoes and garden truck the same as last season. Apples, 50 per cent. in excess of last season. Hay, 20 per cent. less than last year. Tobacco and sorghum about an average condition. Hops, broom corn and cotton not grown here. J. H. L.

CARTHAGE, Jasper Co.—On a basis of 100 for last year's crops, corn is 125; wheat, 60; oats, 50; potatoes 100; garden truck, 100; apples, 120; pears, peaches and grapes, 100; hay, 70; sorghum, broom-corn, all berries and cherries, 100. W. C. D.

ELDON, Miller Co.—Prospects for corn very good. We have had sufficient rain to secure a good steady growth, and it was nearly all planted in good season, and was well cultivated rather better than otherwise. Wheat is about all harvested and will make a full average crop. Oats are good, not as high perhaps as usual, but thick enough and well headed out. Potatoes and garden truck in good condition; sorghum fully up to the average. Plenty of grass. Meadows and clover stood the Winter well, and as considerable of both has already been cut, we are reasonably sure of a full supply of hay. A full supply of fruits of all kinds except peaches. N. J. S.

FULTON, Callaway Co.—Wheat about ten bushels on the average; oats, medium; corn, good. The hay crop short; potatoes and truck, good; small fruit, fair; tobacco promises well. H. C. M'C.

MOBERLY, Randolph Co.—Wheat, first-rate; oats, poor; rye and barley, none; potatoes and garden truck, good; apples, ditto; no peaches; grapes, fair; hay, tobacco and sorghum, good. S. L. A.

RYE, Adair Co.—Corn did not come up well about here, looks bad, will hardly be an average; rye and oats, great growth of straw, fear it will fall, in which case hardly an average; potatoes look bad, want more sun, hardly an average crop; apple crop will be short, pears an average crop; peaches not grown much here, but what few trees I have seen will produce a partial crop; grapes, very abundant, more than an average. B. M.

SPRINGFIELD, Greene Co.—Wheat, good to very good, but not more than 40 per cent. of the usual number of acres on account of two years' failures. Not much rye, barley, or oats sown here; what there is looks well. Corn is the great crop here this year in acres, and in quality of the crop, it is 100 per cent. better than last year at this time, and much cleaner. Potatoes, some early kinds are now being dug for market; quality good, yield light. Late varieties look very promising. Garden truck and vines are very good, much better than last year at this time. Apples a full crop. Pears about half a crop. Grapes are very full, and no rot at present; it was about the first of July they began to rot last year. The hay crop is good where the stock was kept off in the Spring, but too many farmers leave their stock on the meadows too late, and in every case there is no hay worth cutting. G. W.

TRENTON, Grundy Co.—Corn, 150; wheat, 150; oats, 100; flax, 100; rye, 100; potatoes, 120; garden and truck, 120; apples, 130; grapes, 150; hay, 100. W. R. S.

Kansas.

ALDEN, Rice Co.—Wheat will make from 10 to 20 bushels; quality better than last year—hurt some by chinch bugs. Corn waist-high; oats nearly a failure; a few plowed in are good. Potatoes as good as last year; some ready to eat now. Not many bearing fruit trees around here; but what there are, are full; small fruits hurt by three weeks of dry weather. R. M.

BEATTIE, Marshall Co.,—Corn, 100; wheat, 75; oats, about one-half a crop; potatoes look very well, yield, 90; garden truck looks fine; full crop of apples, and many grapes; no peaches; many trees frozen to the ground. G. H.

BELVUE, Pottawatomie Co.—Corn, more planted, but more backward than last year; wheat, four-fifths winter-killed in this vicinity; rye, about the same as last year; potatoes look well at present; apples about as last year, a full crop; peaches, none at all; grapevines are loaded with clusters; hay, not as good as last year; oats look remarkably well. A. S. W.

CLAY CENTER, Clay Co.—Wheat, 100; corn, good; oats, 50; rye, good; potatoes, average crop. Garden truck, grapes, small fruits, good; apples, fair; hay, good. J. A. W.

COFFEYVILLE, Montgomery Co.—Wheat all cut and thrashing commenced. It will average about half a crop. Oats, clover and grass half crops. Corn the best we have had for years; beginning to tassel. Some chinch bugs. Average crops of apples and grapes; no peaches. M. D.

COLUMBUS, Cherokee Co.—We are having very dry weather. About half the wheat is cut; will average three bushels per acre, balance not worth cutting. Less than half the stand of oats will be cut; a great many are pasturing them down. Chinch bugs destroying corn and millet; corn ground generally clean. Garden truck badly dried up. No peaches; prospect good for large crops of apples, pears, plums and grapes. Sorghum the only field crop that is growing 14 miles east on the river, where there has been plenty of rain. F. H. P.

EDGERTON, Jackson Co.—Weather very favorable for corn; large acreage planted; prospect never better; condition, 100. Wheat harvest all done. The State Board of Agriculture places wheat at 50 per cent. In my opinion it will not reach 25 per cent. Injured a great deal by chinch bugs. Oats never looked better; large acreage sowed; harvest begins in a week. No rye or barley sown. Potatoes and garden truck in splendid condition. Apples, good; peaches, none; abundance of small fruit of all kinds. J. R.

ELK FALLS, Elk Co.—Wheat not good.

Oats a failure. Potatoes and garden truck very good. Apples not more than half a crop. G. N.

EMPORIA, Lyon Co.—Corn prospects are now better than they have been in years. Last year this time our corn was very poor and sickly. In 1885 I finished replanting on the 20th of June. This year some of the corn is already pushing out tassels, and the crop as a whole is looking very promising. There are hardly any missing hills. The recent rains will carry the corn way into the ear, if we don't have another rain. Wheat is not as good as it was last year. Great deal of it was winter-killed; others have been ruined by the chinch-bug. The bugs are now working badly in the corn, and will do considerable damage. Oats will be a little short. The straw is short, but is headed out nicely. Some oats will be cut this week. Rye not much sown here only as pasturage. I sowed eight acres for feed, but as we had such a dry Fall last year, a good deal of it did not germinate. Then the Winter killed considerable. Potatoes are very fine. I have Beauty of Hebron, Early Ohio and Early Watson Seedling, a new potato from Iowa, all ready for use now, and I dig a good many large tubers. Every indication points to a bountiful crop. Garden truck is very plentiful. The cabbages are being eaten by worms, but they are growing so fast it does not hurt them badly. Apples will not be up to the average, as many of the trees are suffering from a blight almost similar to the pear blight. Pears are also suffering from blight. The standard pears have very little fruit on, and the dwarfs about three-quarters of a crop. Grapes will be a very large crop from all indications. Hay—the prairie grass is very fine, and as strong in nutriment as I have ever seen it. Cattle have done better on it in the same time than I have seen in six years. Taking all in all, the prospects for bountiful crops are as bright as one could wish for. W. N. D. B.

FREDONIA, Wilson Co.—Corn at least 75 per cent. better than the average last year, and three weeks earlier. Wheat 50 less, but quality of grain better. Oats 50 less, and quality of grain poor. Rye 25 less, and quality of grain poor. Potatoes—early, 25 better; late, 50 better. Garden truck 25 less; apples 50 less, extra quality; pears 50 less; grapes 50 better, of excellent quality; broom-corn 50 better. Area of planting: Corn 15 per cent. more than last year; wheat 25 less; oats 25 less; rye about the same; potatoes 50 more; broom-corn 75 more—a craze among farmers produced by last year's prices. Hay crop 50 less than last year. The outlook for corn is simply immense at this time. Wheat and rye about all in shocks. Never, to my knowledge, have we had a better season for cultivating growing crops. Corn nearly all "laid by," and 75 per cent. of it has been cultivated four times, which is unusual among Kansas farmers. J. H.

GENEVA, Allen Co.—Corn, 125; wheat, 50; oats, 90; potatoes, 100; garden stuff of all kinds, 100; apples, 100; pears, 80; small fruit, 100. W. McG.

GIRARD, Crawford Co.—Corn better by far than last year; wheat the same as last year; oats a good crop; potatoes good; an abundance of all garden truck. Apples lighter crop than usual. Pears the same. Not a peach in this vicinity. Small fruit an excellent crop. Grapes better than usual—vines loaded. Hay below the average. Castor beans above the average and a larger acreage. Sorghum about as usual. No cotton planted. C. H.

HARVEYVILLE, Wabaunsee Co.—In this part wheat is good. Rye, very small acreage. Oats good. Corn in fine condition. Orchard fruits, 30 per cent. of crop. J. J.

HAZLETON, Barber Co.—Corn, 90; wheat, 100; oats, 50; potatoes, 50; garden truck, 40. Peaches an entire failure. Country too new for apples and pears. Nothing but prairie hay cut in this part of the State. Oats, 35 cents; corn, 25 cents; wheat, 60 cents; new potatoes, $2 per bushel. W. F.

LAWRENCE, Douglas Co.—Average condition as compared with last year: Corn, 125; wheat, 80; oats, 90; rye, none raised; potatoes and garden truck, 100; apples, 100; pears, 75. Peaches, none either last year or this. Grapes, 125; hay and sorghum, 100. Crops of all kinds need rain badly. Chinch bugs very thick. J. P.

OSWEGO, Osage Co.—Wheat and oats will be an average crop. Hay, both tame and wild, very fair. Potatoes and garden truck good. F. R. S.

POPLAR HILL, Dickinson Co.—Owing to a very severe winter, dry weather in May and June, and lastly the chinch-bugs, not more than half of the wheat will be harvested, and that is of very poor quality. Early planted corn is looking very finely. The ground is free from weeds, and the corn is from three to four feet high. A great deal of the corn that was listed in the wheat ground is dead, and all covered with chinch-bugs. Before the late rain, oats looked very poor. They are now looking a little better, and will yield about half a crop. Potatoes are doing finely, and have been ready for use for the past two weeks. Peas have dried on the vines, but cabbage, tomatoes and other garden truck are doing well. There are very few apple trees in bearing, but those few will yield an average crop. Small fruits, especially strawberries and raspberries, did well, but were not nearly as large as they would have been if it were not so dry. As compared with last year, everything, excepting corn and potatoes, is poorer. F. W. T.

STRONG CITY, Clare Co.—Corn never looked better at this date. Oats not so good as last year, and will not make more than half a crop. Potatoes and garden truck splendid, and better than last year. Apples and pears not so good; peaches none; a few last year. Plums abundant, especially wild; grapes about an average—perhaps a little better than last year; hay about an average; raspberries good, and better than last year; hardy blackberries better; wheat, little sown, and that about as poor as can be. Of rye, barley, cotton, broom-corn and sorghum little or none is grown. J. S.

WICHITA, Sedgewick Co.—Wheat is about all harvested, but will not be more than half an average crop. Oats very short on account of dry weather all the Spring—not half a crop. Corn in good condition, clean and a good stand; prospects good for a large crop. Potatoes not very good, too dry; but they have been making a second growth since the rain on June 1st. Garden truck good. Apples a fair crop. Peaches and cherries nearly all winter-killed. Plums good. Grapes plentiful. But very little tame grass grown here; nearly all wild hay as yet. J. J. A.

WILLIS, Brown Co.—Corn, 110; wheat acreage less; quality and yield, 115; rye about the same; barley little sown; potatoes and other garden truck splendid; apples 60. H. F. Y.

Nebraska.

CAMBRIDGE, Furnas Co.—Crops of all kinds are looking well, with a few exceptions. Grain looks better than a year ago. Fruit is in its infancy here. Trees and small fruit put out last spring are making a fine growth. C. C. N.

DAVENPORT, Thayer Co.—Corn, 100; wheat, 75; oats, 80; rye, 110; barley, 75; potatoes, 100. A. M. M.

EXETER, Fillmore Co.—Wheat heading, thin, rusty; 60 per cent. of average. Corn backward, mostly replanted; 90 per cent. Oats, 100; barley, 80; flax, 110; rye not much raised, 80; millet, 120; potatoes, 90; garden truck, 100; hay, 100; grapes, 100; small fruit, 115; orchard fruits, 40. Cherries a failure. Peaches winter-killed. Late, backward spring in this section. Hot and wet with violent thunder showers. J. A. J.

HASTINGS, Adams Co.—The season has been more backward than usual. During the early part of the Spring rain was very abundant, and it was difficult for farmers to get in their small grain in first-class condition. Small grain grew well and was looking fair until about 10 days since, when the weather became rather dry, and spring wheat has been somewhat injured; but refreshing showers during the last three or four days will tend to help. Prospects now are that small grains will be fair crops. Corn is looking well and bids fair to be a good crop. Unless some unexpected calamity occurs, this section of Nebraska will be up to the average, all things considered. J. B. H.

HORNERVILLE, Gosper Co.—Compared with last year, corn is better; wheat about the same; greater acreage. Oats better; rye very good; potatoes the same as last year; garden truck very good, as is usual; grass very good; broom-corn good; great amount planted; sorghum good, not much planted. This being a newly settled country, there are not many bearing orchards. J. H. K.

NEBRASKA CITY, Otoe Co.—Crops are good. Wheat, corn, oats, rye, barley and garden truck, from 15 to 20 per cent. better than last year; apples, about the same; berries of all kinds are 50 per cent. better; grapes and hay a very heavy crop. B. F. H.

PICKNELL, Gage Co.—Corn shows 110; wheat, 80; oats, 80; rye, 100; barley, potatoes, 100; garden truck, above 110; apples, about 50; hay good, 100; flax 300 area. S. E. T.

PLATO P. O., Saline Co.—Small grains all look well, except the wheat, which will not make much more than a half crop; oats, barley and rye are looking splendid; corn is much advanced; fruit of all kinds will be plentiful; as to garden truck of all kinds, it never was better. Everything looks promising. J. A. B.

SCHUYLER, Colfax Co.—Crops look well. There is a large acreage of small grain. Wheat, corn, rye, oats, barley and potatoes are good. Fruit a success in some localities. Broom corn and sorghum good; garden truck excellent. E. J. D.

WILLOWDALE, Antelope Co.—As compared with crops last year: corn is 110; wheat, 110; oats, 98; rye, 100; barley, 105; potatoes, 115; garden truck, 120; hay, 120; sorghum, 90. A. K. F.

Dakota.

ARLINGTON, Kingsbury Co.—Wheat compared with last year's, will average only one-half crop; short, thin and uneven. Corn good and well advanced, but acreage low; oats heading too close to the ground and very light; rye not much grown here; barley poor and only half the usual acreage; flax 15 per cent. more acreage, but small; still the chances are good for clean fields. Potatoes are better than a year ago; garden truck always good here; orchards are yet too small to bear much; tame hay light; wild grass good; hops look good, but are raised only for household purposes; trees are putting out an extra good growth. Acreage of trees planted here this Spring 50 per cent. more than last year. W. A. P.

DE SMET, Kingsbury Co.—Crops of all kinds looking well and growing very fast. We are having warm weather with plenty of rain, but I do not think wheat will yield as well as it did last year, being somewhat thinner; but everything else, such as oats, barley, flax, rye, potatoes and garden truck, I think will be fully as good, and corn is doing a great deal better than last year. It looks as though we would get a big crop. Hay about the same as last year. F. J. P.

GRAND VIEW, Douglas Co.—Wheat, oats, barley and corn at this time promise full crops. Flax looks well. H. A. S.

HURON, Beadle Co.—Corn looks 150; wheat, 60; oats, 100; barley, 100; potatoes and garden stuff about 125. W. A. B.

MIDWAY, Moody Co.—It was quite dry here during May, and it will shorten the yields of wheat, oats and barley at least 25 per cent below last year's crops. I think one-third of the tilled land is in flax. The early-sown flax is looking exceedingly fine; but the late flax came up very unevenly, and will be a short crop. Corn is better than at this time last year. Potatoes never looked better. Small fruits doing well. Strawberries in abundance; never better. J. W. D.

ROCKERVILLE, Pennington Co.—Wheat yielded 35 bushels per acre last year; oats 75 bushels; barley 44, and a prospect for a better yield this year. E. S. G.

PLYMOUTH, Ransom Co.—Corn, 100; wheat, 105; oats, good; rye, none; barley, extra; potatoes good; garden truck good; small fruits good; hay, good. J. S.

Colorado.

FORT COLLINS, Larimer Co.—The crops as a whole this year look much more promising than last—wheat, 100; oats, rye, barley, perhaps crop not quite as good. Last year all fruits, such as apples, grapes, etc., were killed. This year there will be a full crop. Small fruits, strawberries, etc., will be a full crop. Hay is average. Corn not as good as last year. Other crops look well. * * *

WRAY, Weld Co.—This is a new country and there is nothing but sod crops to report. Sod corn looks well, where not cut down with hail. Millet and Alfalfa good. Pumpkins and melons cut down by hail. J. B.

California.

COTTONWOOD, Shasta Co.—Crops are better than they were last year. About the same acreage sown. All fruits in abundance, except peaches, which will be a light crop in some places. J. O. S.

NEWCASTLE, Placer Co.—No small grains are raised here except for hay. Potatoes and garden truck (except tomatoes) only in a small way. Tomatoes are grown quite largely—crop good. Apples, fair; pears, good; peaches, one-third of a crop; plums and prunes fair lots. Poor grapes. Very large field crops. C. M. S.

PENRYN, Placer Co.—This place is particularly devoted to the growing of fruit, and we think there is no place in this State where the varieties adapted to this climate are produced in a higher degree of excellence. Strawberries and raspberries are nearly all marketed, and while the crop is much less than last year, prices have been so much higher that more net money will be made this season. Blackberries are now being picked; crop about the same as last year, but prices are better. Crops of peaches and plums will not be half so large as last season in old orchards, but as there are many new orchards just coming into bearing, more than half as much will be sold, and prices so far have been more than double those of last year, with the prospect of being good throughout the season, as all our surplus can now be sent East through the California Fruit Union at a low rate of freight. Crop of hay unusually large and prices low—$8 to $10 per ton. Wheat, barley and oats yielding heavily. Corn and rye are grown only to quite a limited extent. The total amount of fruit shipped from the towns of Penryn and Newcastle last season was 283½ cars of 20,000 pounds each, and but a small proportion of our orchards are as yet in bearing. P. W. B.

Indian Territory.

OAK LODGE, Choctaw Nation.—Corn and cotton much above the average of last year. Oats a half crop; prairie hay short; garden truck good. G. W. B.

Washington Territory.

PORT TOWNSEND, Jefferson Co.—Wheat, 100. Oats, barley, garden truck and potatoes somewhat short, on account of drought. Hops looking splendid, about 125 per cent. of an average.. A good many raised in the valleys here. No corn raised; fruits, 100; no grapes grown here; hay, 75. J. C. C.

PUYALLUP, Pierce Co.—Everything is two or more weeks late. Compared with this date for 1885, all kinds of grains look fully as well with greater acreage—could not be better. Potatoes and all vegetables are looking fine, but owing to a cold, wet Spring, a good many seeds failed to come up, and the stand is at least 25 per cent. short in most cases. For some reason fruits will not be a big yield, though for size and quality they cannot be excelled. Small fruits are, and will be, abundant. The bushes are simply groaning under their immense loads of big berries, such as only Washington Territory can produce. Specialties are hops, looking as they always do, A 1, but later. Of specialties, many kinds of pears; prunes and all kinds of berries will soon have a pre-eminent place, and be as noted the world over as are to-day Washington Territory hops. J. M. F.

Canada.

BRAMPTON, Peel Co.—Fall wheat badly winter-killed; about half a crop. Spring crops sown when the ground was too wet, rather poor prospect, but they may improve. Barley looks much more promising than wheat. Apples promise an extra crop; other fruits not extensively grown, except berries, which promise well. Hay generally good. Everything earlier than last year. The very best we can hope for is 75 per cent. of last year's crops all round. D. J. M'K.

BRIGHTON, Ontario.—Corn poor; wheat, fall, extra; spring, fair; oats, good; rye, extra; barley, good; potatoes not so good as last year; truck very good; apples not as good as last year; pears and plums none; grapes good; hay extra; hops looking well. All crops are looking better than last year. Had it not been for last week's rain things would have been poor. R. P. J.

ELLESMERE, York Co., Ont.—Spring wheat, oats and barley are looking well, with prospects of good average yields. Three-fourths of fall wheat winter-killed. Hay below an average. Potatoes looking well. J. W.

HAWKINSBURRY, Ontario.—Have had an early favorable Spring, with seasonable rains. Wheat, oats, barley, corn, peas and potatoes look promising; apples and small fruits grown to a limited extent only; but will be full crops; hay, new meadows, good; old, only fair. J. G. H.

GRANTON, Ont.—Fall wheat looks well and is more forward than at this date last year, but late sown won't average half a crop, more having been put in than otherwise would, owing to the failure of spring wheat last year. Oats and barley look well and there will be a full average. No corn of any account sown in our locality. Hay will be about two-thirds the crop of last year. The frost of May 15th and 16th in most localities here injured to some extent apples, grapes, strawberries and early garden stuff. Potatoes are doing well, and not as many of the Bug family as formerly. J. L.

KOMOKA, Ontario.—Fall wheat, 66 per cent.; oats, 90; corn, 100; barley, 80; spring wheat, 70; rye very little sown; potatoes, 110; apples, 85; cherries 200; pears and peaches, very few grown; hay, 50. We have had several showers in the last few days which may increase the percentage. A. D. McL.

LLOYDTOWN, Ont.—As compared with last year, winter wheat is one-half crop; spring wheat, barley, oats and peas about the same. Orchard fruits one-half better. Potatoes better, but bugs worse than ever before. Garden truck better; hay a good crop, about the same as last year. Prices are very poor for all kinds of produce. Wheat 75 cents, and other grains in proportion. R. R.

MANCHESTER, N. S.—Hay promises more than an average crop; corn is not raised here

(Continued on page 453.)

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JULY 10, 1886.

JUDGING from the bloom of the chestnut trees about the Rural Grounds, chestnuts will be scarce this Fall. There is the usual quantity of male flowers apparently, but very few pistillates.

THERE is no oat that we have received better accounts of, both from the West and East, than the Welcome, or White Australian. Both names are wrong. It is an old oat, and never could have originated in Australia, which is not a country in which oats thrive. But it is known now as Welcome, and Welcome it had better remain. It is now at the R. G. the most promising of the many kinds now on trial.

Is it true that dried fruit fumed with sulphur is in any way unwholesome, or usually obnoxious to any sense? In some cases possibly the fruit may be over sulphured so that some of the mineral may condense upon it and affect its flavor, but the grocers say they have not heard and do not know of any such a case, or of any objection being brought against the bleached "schnitts." In other lines sulphur is found very beneficial, especially in destroying minute life that often imperils or distresses our own; as in throat and nose and skin diseases. Miners consider the presence of sulphur in a mine especially healthful, and in cider and wine countries the practice of pouring the liquor into vessels filled with sulphur fumes in order to bar germs of mold and of ferment, and to reduce the amount of oxygen included, is so old and so extensive as to have a special word in the language to express it—the verb to 'stum.' The American dispensary attributes no harmful effect to sulphur taken inwardly in the usual dose.

A NATURAL question which most of our visitors ask before seeing the rye-wheat hybrids is, "What do you expect to gain by the cross?" To this question no intelligent answer could be given, beyond the statement that it was merely an experiment which, if it didn't give us varieties of grain of economical value in one way or another, would certainly prove of scientific interest. We now find there are many plants with large heads bearing in each breast or spikelet an average of four kernels. In some there are five and even six. Other heads bear double spikelets, which are crowded upon the rachis as closely as possible. Among the purely wheat crosses there are splendid heads much thicker and longer than any we have ever seen grown in this climate. The Rural is entitled to have met with some success in its wheat crosses since the work was begun 10 years ago, and though diligently followed up, little of value was produced until the Surprise, Fultzo-Clawson and Dichl-Mediterranean were used as the male plants.

STIMULATED by the success of the Mississippi Agricultural College, various Southern States have made strong efforts to establish live industrial schools. These efforts have for the most part resulted in dismal failures. It would be well if the promoters of these schools would study the real causes of the success of the Mississippi College. There are two chief reasons. It is not attached to any literary institution, but dignifies agriculture to the extent of classing itself as a farmer's school pure and simple. It rigidly enforces the labor system. Every student, as we know from actual observation, is obliged to work on the farm. The college owes its success more to the strict enforcement of this policy than to anything else. Should it relax its vigilance and enthusiasm, we believe it would quickly lose much of its influence and power for good. The trouble with many of the Southern agricultural colleges, is that the trustees put a mouth-piece in the chair of agriculture. They appear to believe that a man can talk an unpopular institution into favor. This cannot be done. It is more work and less talk that is needed and the longer it takes the authorities to recognize this fact the harder the work will be.

ROTATION OF CROPS.

THE correct theory which underlies and explains rotation of crops is not yet determined. The farmer finds it an advantageous thing to practise, yet does not surely know why. It was considered of leading importance by the Romans, and many explanations of its use have been imagined and successively given up. De Candolle taught that the roots of each kind of plant gave off excreta poisonous to itself, while harmless or nutritious to some others. But Tull and Smith, of Lois Weeden, and later Sir J. B. Lawes, have grown the same crop in succession for many years, with no sign of such effect, and it has been commonly done in our own western culture. Gardeners frequently continue the same crop year after year. These facts disprove also another theory, viz., that minute insects and parasitic growth peculiar to each plant get the upper hand when it succeeds itself too continuously. Probably rotation is justified more by convenience than by any absolute necessity for it. Beginning with the turning down of a coarse sod, the farmer finds a strong free-growing plant best adapted to the rough bed, and the time of plowing, convenience of applying manure, etc., guide him in arranging the further succession. Plants that root deeply and bring nutriment within reach of shallower rooting cereals, should naturally precede them. But even that item of theory is hardly yet established. Another consideration is that crops sown in the Fall favor certain winter and spring weeds, which a plowing for any summer crop destroys. Here we find a very important advantage in alternating these, instead of repeating the same crop on the same land, additional to the advantage of famishing out parasitic organisms.

SPECIAL CROP NUMBER.

THE OUTLOOK FOR HARVEST.

IN this issue we present to our readers specimens of over 3,000 reports received between June 25 and July 1 from practical farmers in all parts of the country with regard to the comparative area, condition and outlook for farm, garden and fruit crops in their respective neighborhoods. A careful analysis of nearly all hitherto received, published and unpublished, indicates a very bountiful harvest. There appears to be no noticeable shortage of any crop, while none, except, perhaps, strawberries, is extraordinarily large. Here and there, there are, of course, local shortages or even failures of certain crops, as always must be the case in so extensive a country subject to so many vicissitudes of location, soil, storm, flood, insect depredations and climatic influences; but these mishaps, due to local conditions, however disastrous to particular individuals or locations, do not materially affect the outcome of any crop in the whole country. "Diversified agriculture" throughout the nation at large is evenly balanced, and all branches are thriving. As in individual cases of "mixed farming," a fair measure of success with the various crops goes far toward making the owner prosperous; so the good fortune that appears to attend all the chief crops of the country this year should greatly help to render the farming community prosperous, and to give an impetus to every industry and branch of business; for in this pre-eminently agricultural country, the prosperity of every calling and of every class depends mainly upon the prosperity of agriculture.

Wheat, the great money crop of the North as cotton is of the South, is a fairly good crop. The area of winter wheat is 24,727,087 acres against 22,148,543 acres harvested last year, when 25,975,659 acres were sown, of which nearly 4,000,000 acres were either plowed up or not harvested owing to the poorness of the crop. The yield is variously estimated at from 280,000,000 to 300,000,000 bushels. Our own estimate, formed from information from our own reports and from a multitude of other sources, is 295,000,000 bushels, against 212,000,000 bushels in 1885. Kansas has suffered severely from drought and insect pests; and the crop will not be much over 50 per cent. of an average. Michigan, which last year had the best crop in quantity and quality, falls away behind in both respects this year; while Illinois which suffered most severely in 1885, has a fine crop in 1886; California, however, appears to be the "banner" wheat State this year. Spring wheat has been seriously damaged by a protracted drought, and later rains have only partially made good the injury. The yield, on a somewhat smaller area than last year, is likely to be not over 140,000,000 bushels, making the aggregate wheat yield 435,000,000 bushels—78,000,000 more than last year's output. It is probable the wheat crop will move to market unusually early this year, because the harvest is from one to two weeks earlier than usual; and also because the short crop of last year left farmers short of money, and they wish to realize on this year's crop as soon as possible, and, moreover, the stocks on hand are unusually small, especially at interior points, and millers will take the wheat readily as soon as they can get it. More than usual has already passed from the farmers' hands, chiefly for milling purposes, and reports are general that the quality of the grain is better than usual. August 1 should be considered the beginning of the crop year, rather than September 1.

Corn, by far our most important cereal crop, promises a large yield per acre; but it can hardly be as large as the phenomenal output of 1,936,000,000 bushels last year. Then the yield was 26¼ bushels per acre on nearly 74,000,000 acres—the first full average in the rate of yield since 1880.

Last year the oat crop was the largest ever grown—629,000,000 bushels on 23,000,000 acres. On a slightly increased acreage, the crop will be much less this year—probably not over 600,000,000 bushels—as it has been seriously injured by drought and insect pests in many parts of the country, but especially in the West.

Rye, which is grown in both winter and spring wheat regions, for grain chiefly in the North and for pasture mostly in the South, will be a somewhat larger crop than last year. The area of barley has increased considerably, especially in Kansas, Minnesota, Texas, Tennessee and California. The average is high, especially in New York, Wisconsin, Minnesota and California, which States are by far the heaviest producers. Both rye and barley appear to be among the surest of cereal crops.

In New England there is a considerable decline in the area under potatoes, always one of the most important products of that section. The low prices of the tubers and the great prevalence of rot the past two seasons, have induced the farmers of Massachusetts and Rhode Island to substitute hay to a considerable extent, while those of New Hampshire and Vermont appear to prefer corn. The crop, however, in the country at large is likely to be heavy, especially that of early potatoes, and prices can hardly be high.

New England will have a large crop of apples, but the crop in the rest of the country is not likely to be very heavy on the trees. Owing to the cool weather the trees remained in bloom a long time, and from every quarter come complaints of the dropping of the young fruit. The crop is likely to be low throughout the South, and orchards were greatly injured by the severity of last Winter and late frosts in Spring in the Ohio Valley and the Northwest. As this is generally the "bearing" year, however, and a large number of apple trees have of late been annually planted, there is no fear of a scarcity of fruit. Pears are a poor crop, and the same might be said of peaches were it not that there is a cheap abundance every year in the markets in spite of repeated reports of great damage or utter ruin to the peach orchards. Strawberries everywhere extremely plentiful, so superabundant, indeed, that in many places it would not pay to pick and market them. In some places the beds have been thrown open to the public; in others the berries have been fed to swine, while in others they have been allowed to rot on the ground. In many places pickers put up their prices in spite of the low markets, so that growers could not afford to gather their crops. In spite of low prices, however, probably more money than ever before has been realized from the crop. Other small fruits are abundant.

Grass, the king of crops, for pasture and hay, has suffered greatly from drought in various parts of the country, chiefly in Texas, the West and Northwest. Injury from freezing is also reported from many quarters. The greatest damage has been done on old meadows, new seeding having generally done well. The season has been quite favorable to clover, and though there are reports of injury to this also, they are not nearly so numerous or widespread as those relating to grass. Increase of area has been quite extensive both in clover and the "tame" grasses, especially in the South and West where clover has to some extent taken the place of Timothy. Last year the hay crop was 47,000,000 tons; it is not likely to be very much less this year.

Although tobacco has hardly been a profitable crop for the past year, about the usual area has been planted, chiefly because it is difficult to get out of a long-continued routine, and because no other "money crop" can be so easily raised by the growers. The outlook is reported fair, though it is much too early yet to speak definitely. Hops have been a very unprofitable crop the past year. While it costs from 13 cents to 14½ cents a pound to raise and handle them, they have been selling for all the way from four and one-half to 12 cents. There has been some decrease in acreage, chiefly by the plowing up of old yards and the dropping out of those who were not regular growers, but who were induced to enter the business by the high prices that ruled a few years ago. Until a few days ago reports from all the hop-growing sections were exceedingly favorable, and a continuance of overproduction and low prices seemed inevitable; but for a few days complaints have been coming from Otsego County and the adjoining hop-growing parts of this State to the effect that the yards were in danger of destruction from insect pests and "honeydew" on the vines.

A slight decrease in the area of cotton in some of the older States is more than counterbalanced by the increase in the new States, especially Texas, and to a less extent, Arkansas. Every year resolutions are passed in public assemblies, and resolutions made in private to curtail the area under the staple, and devote more attention to food crops. Planters realize the advantages of raising their own provisions; but each waits for his neighbor to make the desired change. Even the low prices for cotton of late, instead of inducing a curtailment of the crop, have tended to produce an expansion; for as the planters are generally in debt to their commission men, they have to procure a certain amount of money, and the less they get for the product of an acre, the larger the area they have to plant. The present area is about 1¼ per cent. greater than last year, but the condition is considerably poorer.

BREVITIES.

PLANT a few Savoy cabbages for home use.

THOSE who have not raised their own celery plants may now purchase them of seedmen. For main crop, any time before the middle of August will answer.

WE doubt very much if there be any real profit in farmers or farmers' men working hard during hot weather immediately after dinner. And remember the horses, too.

WE are now (July 1st) spading up the soil between our strawberry plants that have been growing in matted rows, leaving only one foot in width of plants. Later, the inverted soil which will be enriched by the plants turned under, will be covered with stable manure, two inches or more in depth, and after frost, the plants will also be covered though not so heavily.

IN the pamphlet entitled "How to Grow Celery" by the Kalmazoo Celery Co., we find the following as to Perfection Heartwell Celery which was sent out in the Rural's Seed Distribution several years ago: "A strong growing variety, not so desirable as some others, though it answers for light and poor soils." We have grown it every year since its introduction, on moist, rich and rather heavy soils and we know of no better variety as raised under the same conditions.

PROFESSOR AUGHEY found, by careful test, that prairie soil, which had been broken up by plowing, contained, immediately after rain, nine times as much moisture as adjoining unbroken soil, and this seems to explain the extension of the rain belt westward. Let such broken-up soil become covered with shrubs and trees, and annually mulched by their falling leaves, and it will continue absorbent and retentive of moisture without losing any of its substance and its fertility, as it is always liable to do when turned over and left bare, excepting, perhaps, in the comparatively scarce level alluvions.

THE Sheffield (Eng.) School Board, after some experiments in supplying to the schools the "silent ministry of flowers," has ordered 10,000 plants—geraniums, fuchsias, petunias, and other sorts most easily and generally cultivated. They are all in pots of the same size and kind, and stamped with S. The pots weigh four-and-a-half tons, and take 12,000 gallons of soil. They will be delivered in equal and good condition, and distributed among the children, who will keep them about six weeks and then exhibit them to compete for prizes. Certainly an interesting experiment all through.

THE R. N.-Y. always tries to respect the opinions of those who write from experience, how widely soever such views may differ from its own. But there are many who own and work neither gardens nor farms who write either for the sake of writing or for the pay they receive from equally inexperienced publishers, who value such communications, as they are written in a plausible, interesting manner. Previous to experience, it is hard to see how such writers can sift the grain from the chaff, let them be ever so gifted in constructing theories and writing them in a forcible way. Thus it is, in great part, that worthless plants and silly methods are often advocated. When once started, they "go the rounds," and it seems next to impossible to head them off. Hundreds read the statements where scores read the contradictions.

SPECIAL CROP REPORTS.

(*Continued from page* 451).

as a field crop, the seasons are too uncertain; wheat is not sown here at present. Very little rye was ever sown here; oats, barley and potatoes promise well; but the potato crop will depend entirely on the weather; potatoes, early planted, now are fit to hoe, and they are seldom fit to hoe here before the 10th of July. Garden truck, especially potatoes and onions, are much further advanced than last year at this time. D. S.

NIAGARA, Ont.—Although the Spring opened unusually early, the opening was immediately followed by a long continuance of cold, wet weather, causing a late Spring seeding. Corn promises well: fall wheat a fair average: oats, though late sown, are growing finely; rye, very little grown; barley looking well; potatoes very good; garden vegetables doing finely; apples promise a fair crop; peaches very light but I think fully up to last year's; pears, plums, cherries and quinces, large crops; raspberries, both red and black, looking very fine and will be a very large crop; currants and gooseberries are likewise good; new meadows are good, especially clover; old meadows rather light. On the whole, I think the grain crops will be fully up to last year's, and fruit will be considerably more.

A. S. B.

OLINDA, Ontario.—Corn extra good; fall wheat, good showing; oats and potatoes good; barley, none; garden truck abundant; apples large crop; pears medium; peaches very large—first crop in three years; other orchard fruits good; grapes large; hay, newly sown, extra; old, not so good; tobacco three acres to one last year, fair; sorghum medium; broom-corn, late. E. C.

OSHAWA Ont.—Wheat, not much sown, on account of low prices. Barley, oats and peas promise good crops. Corn, potatoes and garden truck looking well. Apples and small fruits generally promise fair crops. Hay will average light through this part of Canada.

S. B. G.

PORT DOVER, Ontario.—Wheat, barley and rye, each about 70; corn, oats, potatoes and garden truck, 110; apples, pears, sorghum, grapes, hops, 100; hay and peas, about 100; wheat, 70. W. W. W.

ST. CATHARINES, Ontario.—Wheat will not be quite up to the average, only about three-fourths of a crop. Oats, rye and barley will be full crops. Potatoes will be a good crop. Garden truck is scarce and late. Apples and pears are showing a large crop of fruit. Peaches, a complete failure. Hay, a full crop on all light sandy land, but on the clay it will not be more than three-fourths of a crop. Corn will be a short crop. Tobacco is not grown around here.

SUPPLEMENTAL.

ARKANSAS.

HELENA, Phillips Co.—Corn, 110; wheat, none raised; oats, 90; rye, none; barley, none; potatoes, 100; garden truck, fruits, etc., same as last year; hay, 85; cotton (staple crop of this section), in uplands, 100; low lands subject to overflow, cotton planted late, but good stand; it will make fully three-fourths of a crop. Heavy rains past week, but all report no harm done so far. Western Mississippi land subject to overflow. Cotton planted late; too much rain since June 1st; condition, 50; hay, 100; corn, 75. J. B. R.

CALIFORNIA.

SANTA ANNA, Los Angeles Co.—Corn and barley full crops; potatoes and garden truck good; early peaches scarce; late peaches good; grapes fine; Alfalfa hay not so good as last year, but a fair crop; barley hay a good crop; hops, fair prospects. J. R.

IOWA.

PLEASANTON, Decatur Co.—As compared with last year, corn is 100 per cent.; oats, 90; potatoes, 90; apples, 125; cherries, 50; grapes, 100; Timothy, 75. We are having very dry weather. Meadows and pastures short; very bad for garden truck. Stock doing well; no hog cholera. W. E. P.

KANSAS.

HOWARD, Elk Co.—Crop prospects are better than last year. The acreage of corn is larger than ever before; early fields in silk and tassel. A big crop can be counted on with tolerable certainty. But little small grain was sown, and owing to ravages of the chinch bugs the yield will be below the average, especially with oats: many fields being left uncut. Potatoes will be plenty—at least double last year's crop; garden truck all around has done exceedingly well; apple trees are well laden; no peaches. Cherries and plums, and all kinds of small fruits have done well; hay crop, good. P. N. W.

KENTUCKY.

BOWLING GREEN, Warren Co.—Corn, 20 per cent. better; wheat, 30 per cent. and would have been better than this except for much rain during harvest, and since. Oats, 30 per cent. better; rye about the same as last year, but not much raised in this part of Kentucky. Potatoes, Irish, fine, full crop and good; sweet potatoes are too far from maturity to speak of. Tobacco, larger area, better stand of plants and earlier planted, but very foul; could not be worked for the rain; somewhat "frenched" of earliest planting, but with favorable weather hence will be a larger crop and better, as last year's was poor in quality. Apples, fair crop; no peaches; fire blight in pears worse than ever known, almost wholly destroying many orchards. W. L. D.

CLARKSVILLE, Campbell Co.—Corn looks well, acreage small; wheat, about average crop, if not injured by present wet weather. Rye about the same as wheat, but acreage small; barley, about an average crop; potatoes good, rather above average; apples, a large crop in good condition; pears, small crop; peaches, none; grapes about the same as last year, only in better condition—the best I have ever seen. Hay, poor, hardly half a crop; tobacco, acreage rather small, owing to scarcity of plants; oats, good—better than last year. A. A. W.

MISSISSIPPI.

JACKSON, Hinds Co.—Our corn crop is 10 per cent. better. We raise no wheat. Oats have been generally good; a full crop has been harvested. We raise no rye and barley. Potatoes have been good, and gardens generally are quite good. Apples and pears did not fruit well, while peaches are unusually good. The grape crop will be a good one. Hay has been hard to cure, on account of the rains. We raise no tobacco, hops or broom-corn. The cotton acreage is larger than last year, but the crop prospects not so good R. G.

NEW YORK.

COVENTRY, Chenango Co.—Dairying is the chief occupation here; cows are doing extra well. Grass on new seeding, fine; but on old meadows, poor. Oats and wheat look fine; corn and potatoes backward; acreage about the same as last year. Apples will be above the average, but not more than two-thirds of last year's crop. F. E. B.

NORTH CAROLINA.

RALEIGH, Wake Co.—Cotton, corn, potatoes and garden truck much better than at this date last year, with much more favorable prospects of full crops. Wheat and oats now harvesting; wheat generally a failure; Spring oats good crop; tobacco not as good, prospects less favorable. Fruit not as good; outlook far less promising. Frequent rains, unusual here at this season, have injured peaches and grapes, causing rot. Otherwise they have been, under prompt culture, rather beneficial. B. F. W.

OREGON.

WOODBURN, Marion Co.—The general condition of all kinds of grains, grass and fruits, is fully up to the average throughout Western Oregon. In Southern Oregon the fruit crop will be light. In Eastern Oregon the grain outlook is fair, though continued dry weather may cut grain short, but it is not seriously hurt by it. Taking the State as a whole, I may safely say wheat, oats, barley, rye, corn, grass, and the fruit crops will be a good average. J. H. S.

WASHINGTON TERRITORY.

COLFAX, Whiteman Co.—There has been no rain of any account in the Palouse section for months, and serious damage to crops is the result. Wheat two-thirds of a crop; early-planted potatoes and garden truck are looking well; apples were thinned out by late frosts; strawberries and other small fruits at least two weeks earlier than last year and yielding well. J. M.

WISCONSIN.

PLYMOUTH, Sheboygan Co.—No rain to speak of since May 18. Rain might make a good corn crop yet, but potatoes, wheat, rye, oats and barley won't be over one-fourth of a crop; hay half a crop; apples started well, and with plenty of rain bid fair to be a better crop than last year. S. E. C.

WHEAT CROPS OF THE WORLD.

THE wheat crop of the world for 1885-6, harvested last year in the Northern Hemisphere and early this year in the Southern, is calculated as follows:

	Bushels.
Europe	1,218,000,000
North America, including Can. and Mex.	409,000,000
South America	25,000,000
India	287,000,000
Australasia	37,000,000
Asia Minor, Persia, Egypt, Algeria, etc.	134,000,000
Total	2,110,000,000

This does not include the four to five million bushels of Asiatic Russia, or the unknown quantity produced in China, to which country a considerable quantity of flour is now shipped from San Francisco. Of the above production in "North America," the United States yielded 357,000,000 bushels. The following table shows, in millions, the yield of the various European countries, their average consumption, the surplus in some and the deficiency in others:

Countries.	Crop 1885. Bushels.	Consumption. Bushels.	Surplus. Bushels.	Deficiency. Bushels.
Austria-Hungary	154	144	10	—
Belgium	20	38	—	18
Denmark	5	3	2	—
France	313	343	—	30
Germany	107	117	—	10
Great Britain	82	225	—	143
Greece	5	10	—	5
Italy	118	136	—	18
Netherlands	5	12	—	7
Portugal	8	9	—	1
Roumania	23	18	5	—
Russia	209	144	65	—
Servia	5	3	2	2
Spain	114	114	—	—
Sweden & Norway	3	5	—	2
Switzerland	2	11	—	9
Turkey	45	40	5	—
Total	1,218	1,375	89	243
Deduct surplus				89
Absolute deficiency				154

In Continental Europe the tendency is strong to increase the acreage under wheat, each country being anxious to be self-supporting, and the Continent would require little from outside after the surplus of one section had been distributed where deficiencies exist in others. In several countries wheat is only a supplementary food crop, rye being the real "staff of life" in the Northern countries, as Norway, Sweden, Northern Russia, Denmark and parts of Germany, etc.: and corn in the Southern countries, as Italy, Hungary, Roumania, etc. The heavy import duties lately imposed on foreign cereals, especially wheat, by France, Germany, Austria-Hungary and several other countries, have greatly stimulated the home production of these commodities. The duty on wheat in France now is three francs per 100 kilograms, equal to about 16 cents per bushel, and French agriculturists ask a franc more. In view of the cost of rail and ocean transportation and other charges, these duties are almost prohibitory for American and other foreign grains, so that the supplying of the deficiency in the English markets is the great point of competition among all countries that produce a surplus of wheat in any part of the world.

From 1874 to 1881 the average yearly production of Europe was 1,144,000,000 bushels, and the consumption for food and seed 1,312,000,000 bushels, leaving an annual deficiency of 168,000,000 bushels. The annual production for the last five years, however, from 1881 to 1885, was 1,218,000,000 bushels, an increase of 74,000,000 bushels over the previous eight years. There has been an increase in population, and a proportionate increase in consumption, that of last year being 1,372,000,000 bushels, an increase of 60,000,000 bushels over the average for the eight years before 1881; yet a part of the former deficiency is provided for, and there has also of late been an increase of 63,000,000 bushels in the acreage and production of North Africa, India, South America, Mexico and Canada, stimulated greatly by years of European scarcity of home-grown wheat, and consequent brisk demand and high prices for foreign products, and two-thirds of this has been available for export; hence the foreign market for American surplus wheat is steadily growing less.

The rate of consumption of wheat in Europe which varies from one bushel a head in Norway to nine bushels in France, is about three-and-one-half bushels, with about half a bushel more for seed, or nearly four bushels a year per head for every man woman and child, for food, seed, manufacturing purposes, stock feed, etc.

The Department of Agriculture has lately been making special inquiries with regard to foreign wheat production, and it reports that on May 1 the prospects were good for a European product equal to that of last year, or about 1,218,000,000 bushels, so that there would still be a deficiency of 154,000,000 bushels to be supplied this year, putting the deficiency at the same figure as last year. The averages of yield in Austria-Hungary, France, Germany, Great Britain and Ireland and the Netherlands range from 15 bushels in Austria-Hungary to 28 in Great Britain, and the average of all for five years is nearly 19 bushels. Russia has an area of nearly 31,000,000 acres, and yields scarcely eight bushels per acre. Other countries have an aggregate of about 29,000,000 acres and produce an average of 11 or 12 bushels per acre. The average yield in the United States the present harvest is estimated at 12 bushels per acre, against 13 bushels per acre in 1884, the year of the heaviest aggregate wheat yield.

The area planted in wheat and now harvested or growing is probably very nearly as follows:

Divisions.	Acres.
Europe	94,000,000
North America	40,500,000
South America	6,000,000
India	26,000,000
Australia	3,500,000
Africa and Western Asia	13,000,000
Total	183,000,000

The supply of the commercial year 1886-7 must come from the crops harvested in the early months of this year in the Southern Hemisphere, and from those already harvested or to be harvested in the Northern Hemisphere. The crop of India, grown on a largely reduced area, is said to have fallen from 287,000,000 bushels last year to 265,000,000 this. Home consumption being estimated at 240,000,000 bushels, the exportable surplus is reduced from 47,000,000 to 25,000,000 bushels. According to the brightest early reports, the Australasian crop does not exceed 22,000,000 bushels, so that the exportable surplus has fallen from 17,000,000 to 2,000,000 bushels. Later reports, however, say that instead of a surplus there is a deficiency, so that importations of wheat will be needed.

In South America, however, the surplus for export has increased about 5,000,000 bushels, so that the entire quantity available for export in these countries is smaller by at least 32,000,000 bushels than it was last year. Reports from Europe yesterday say it is estimated that the French wheat crop will be three-sixteenths, or 58,000,000 bushels short, and if this is true, France may have to import 90,000,000 bushels this year, against 32,000,000 bushels last year. In Great Britain there has been a reduction of from eight to 10 per cent. in the wheat acreage, which would indicate a falling off of, say, 8,000,000 bushels in production. The latest advices say the wheat crop of the United Kingdom will be from 15 to 18 per cent. short, for owing to the cool weather a good deal is sure to be caught by early frosts before maturity.

The very latest reports from other European countries indicate that crops will not be above an average, and in view of the shortages, actual or probable, above mentioned, it is pretty certain that the foreign deficiency this year will be considerably greater than last year, while the foreign surplusage will be considerably less.

Last year our aggregate crop amounted only to 357,112,000 bushels, while our exports are estimated at 67,000,000 bushels against an average of 116,000,000 bushels for the last five years. As the demand for food was 271,000,000 bushels and for seed 51,474,906 bushels, there would be left only 24,638,094 bushels for export out of the whole crop, so that at least 42,000,000 bushels of the estimated exports must have come either wholly from the surplus of the enormous crop of 513,763,900 bushels of 1884, or from that and an unusual diminution of the stocks on hand. The aggregate crop of this country is estimated at from 425,000,000 bushels—88,000,000 bushels more than that of last year—to 465,000,000—108,000,000 more—we put it at about 435,000,000 bushels, about 78,000,000 bushels more. The stocks on hand after the remarkably short crop of last year, must be unusually small; there do not seem to be an uncommonly large stocks in Europe or on the way there; the shortages are likely to be greater than last year; and the surpluses are certainly smaller, therefore we see no reason why we cannot find a profitable foreign market for all the wheat we may wish to send abroad, so as not to leave too much on hand to compete with the harvest of 1887.

THE CORN CROP OF THE WORLD.

THE following table gives a fair idea of the corn acreage and yield of the world, the figures for the United States, Canada and Mexico being those for last year's crop, and those for the other countries the amounts given in their last official reports, which are made only occasionally:

Countries.	Acres.	Bushels.
United States	73,150,150	1,936,176,000
Canada	200,000	5,000,000
Mexico	10,600,000	213,000,000
Russia	11,361,000	70,234,000
Roumania	1,423,000	43,000,000
Austria-Hungary	5,458,757	105,640,810
Italy	4,240,264	75,645,857
France	1,525,787	27,689,976
Spain	2,300,000	87,378,388
Portugal	1,284,960	20,288,000
Total	114,521,915	2,535,043,156

Thus it appears that this country produces three-fourths of the corn of the world, and for the last five years the average yield has been 1,619,000,000 bushels, of which we have exported only an average of 56,000,000 bushels, or three-and-one-half per cent. Our principal foreign customer is Great Britain, which, in the last five years has imported 56,000,000 a year. Of this, the United States has furnished direct, 36,000,000, besides some that has gone through Canadian ports. Roumania, Turkey and Russia supplied the rest. Except here and in Mexico, corn is a minor product. There are also some areas of corn in South America, Northern Germany, Algeria, Egypt, Australia and the Cape of Good Hope. The total present area under corn in the world is approximately, 120,000,000 acres, [and the annual product 2,600,000,000 bushels, or about 22 bushels per acre.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

BE KIND TO THE LOVED ONES.

Be kind to thy father, for when thou wert young,
Who loved thee so fondly as he?
He caught the first accents that fell from thy tongue,
And joined in thy innocent glee.
Be kind to thy father, for now he is old,
His locks intermingled with gray,
His footsteps are feeble, once fearless and bold—
Thy father is passing away.

Be kind to thy mother; for, lo! on her brow
May traces of sorrow be seen;
Oh, well may'st thou cherish and comfort her now,
For loving and kind hath she been.
Remember thy mother; for thee she will pray
As long as God giveth her breath;
With accents of kindness then cheer her lone way,
E'en to the dark valley of death.

Be kind to thy brother; his heart will have dearth
If the smile of thy love be withdrawn;
The flowers of feeling will fade at their birth
If the dew of affection be gone.
Be kind to thy brother wherever you are;
The love of a brother should be
An ornament purer and richer by far
Than pearls from the depth of the sea.

Be kind to thy sister; not many may know
The depth of true sisterly love;
The wealth of the ocean lies fathoms below
The surface that sparkles above.
Thy kindness shall bring to thee many sweet hours,
With blessings thy pathway to crown;
Affection shall weave thee a garland of flowers,
More precious than wealth or renown.

—*Unknown Exchange.*

OF INTEREST TO WOMEN.

GAUZE fans painted in water colors, are very dainty and etherial. This work, though requiring much care and skill, is now engrossing many amateur artists.

The most popular beaufet scarfs are of cream or drab linen momie cloth, outlined in washing silk. Conventional flower designs are usually chosen.

A very pretty blotter is made in the shape of a pansy. Four pieces of blotting paper are cut in this shape each four inches across; the top piece is painted in water colors to resemble the flower. The paper is then tied together with lavender ribbon.

The erstwhile aristocratic pug-dog now has his atrevinted nose put out of joint by the setter, the latter being chosen companion of the fashionable damsel on the promenade. The girl accompanying the dog must wear a tailor-made gown and an aspect of British athleticism, according to the fiat of fashion.

For those possessing little hair the best mode of dressing is to comb it all up to the top of the head, pulling it loose in the nape of the neck; fasten it at the top with a plain comb put in slantwise; then divide into two strands and coil into a loose knot on each side. Short hair for women, unless an absolute necessity, is now considered bad style. In London many fashionable women now wear their hair low, in "basket plaits." For this mode the hair is made into fine braids and then flatly coiled in the nape of the neck, after the model of a braided rag mat. It looks as if glued onto the head and is anything but graceful.

The Living Church says that in the farming districts is developed the healthy blood of the people. Let the strong-armed, clear-brained farmers understand this: that to the industry, frugality and contentment of our rural homes we must look for the influences that promise peace and power. And let the young men and maidens, who are blessed with the quiet and healthy surroundings of country life, resist the temptations to swell the ranks of the discontented or unemployed in the noisy and dusty town. It should be noted also, in this connection, that the contrast between the conditions of employé and employer are far greater in the city than the country. The "hired man" in the country works by the side of his employer, has the same fare and much the same privileges. He is not made envious at every turn by the sight of luxuries he cannot share. But the toiler in the streets sees luxury on every hand; he sees men grow rich without apparent effort, and is unhappy, not because his reasonable wants are not satisfied, but because he sees that he is falling behind in the race.

Tell me, is the garden rose
A fairer flower of nobler worth
Than hedgerow pink or bluet frail,
Which lack the rose's garden birth?

Then why should maids of rustic birth
Give place before the city dame,
If garden rose and hedgrow pink
In worth and beauty rank the same?

FLOWERS IN THE SCHOOL-HOUSE.

Among the many refining influences which a thoughtful teacher may bring to bear on her scholars, there is nothing more potent than a taste for flowers. The same taste that will give a touch of refinement to the poorest cottage throws a much-needed grace over a bare school-room. And the children will soon begin to take pride in their teacher's floricultural efforts, whether it takes the form of winter window plants or outdoor summer gardening. As a general thing, the builders of a country school-house seem to pitch their tent on the most barren and sterile spot in the neighborhood, so outdoor gardening is well-nigh an impossibility. So the gardener must make the most of a sunny window. The plants may be contributions from parents who possess them; usually the children are very prond to supply "Teacher" with what she wants, if it is in their power. Simple plants of easy culture may be chosen; the ever-popular Wandering Jew is always pretty, and is not easily disconraged. Oxalis is another nice thing, while Scarlet Geraniums are always neat and thrifty, and turn their smiling faces to their grower through every change of season.

It is not merely for their intrinsic prettiness that we value flowers in the school-room; they will attract and retain the interest of the scholars in a marked degree. If the teacher possesses an intelligent knowledge of plants, she can give most entertaining object lessons on this theme. We do not mean the analytic botany so many graduates possess—that is merely the bleached skeleton of the subject. To engage the attention of children, one should know plants intimately, and enjoy their confidence—study after the system enjoined by Mr. Squeers; "When a boy knows b-o-t-t-i-n-n-e-y means a knowledge of plants, he just goes out and knows 'em." By a sort of anecdotal knowledge of botany and floriculture, a teacher can both interest and instruct. And the refining influence of dainty blossoms cannot be over-estimated. It may not turn rough boys into Chesterfields all at once, but it will be a change in their material lives, and it will help to satisfy that craving for beauty which is the natural dower of every girl.

THE PHILOSOPHY OF OPEN FIRES.

"SHUT in from all the world without,
We sat the clean-winged hearth about,
Content to let the north wind roar
In baffled rage at pane and door;
While the red logs before us beat
The frost line back with tropic heat.
And ever when a louder blast
Shook door and window as it passed,
The merrier up its roaring draught
The great throat of the chimney laughed."

Those lines of Whittier's are our text, and we now proceed to the body of our homily. Where, we ask, do you now see that glorious amplitude of chimney, that generous breadth of ingle, the poet paints?—and echo alone answers—Where? You read of them in stories descriptive of some charming rural hamlet in the New England hills, such as no one ever saw yet, save the writers of the aforesaid stories. No, those delightful relics of our ancestors have given way to the more civilized but unromantic coal stove,—"that red-hot friend of American civilization," as some one pathetically calls it; an ungainly black monster, rejoicing in some horrible inappropriate name, such as Morning Glory, or Dewdrop, or Star of the West.

Query; Are coal stoves a greater sign of advancing civilization than open fires? For in this age, one is nothing without being æsthetic or scientific, and viewing it from the first point, one can scarcely idealize into a harmony or symphony a "new patent action damper automatic regulator self-feeding parlor base burner," as the grimy stove man describes our latest acquisition, even when its beauty (and its cost) is enhanced by certain aggressive ornaments, resembling nickel coffin plates, and an ostentatious nickel-plated bulwark, supposed by students to be evolved from the primitive fender.

Viewed from the Gradgrind point, the coal stove is merely an iron box, more or less complicated in form, which heats so many cubic feet of air, and gives out so many more cubic feet of poisonous gases. As it communicates directly with the chimney, it affords no means of ventilation to the room, whereas the open fire, by means of the generous draught does really purify the air.

For all time, ever since the cacœthes scribendi came into fashion, the open fire has been a source of inspiration for scribblers. In every wintry idyl the heroine sits before the grate, or the wide hearth, with huge logs lying on the andirons, building bright castles in Spain, dreamy pictures demolished by the falling of a few coals. Or we read of the merry group around the hearth at Halloween burning nuts, and roasting apples, and going through all the incantations suitable to the season. But who ever heard of keeping Halloween around a modern coal stove? Why the very nuts and apples and melted lead would rise up to protest against it. I think open fires have a strong moral effect which is decidedly lacking in stoves. Did you ever hear of a mean griping penurious man, who had a wide, generous hearth? No, if he had one he bricked it up, so it would hold a mere slice of fire, like old Scrooge, in the Christmas Carol, and the first thing Scrooge did when he reformed and morally thawed out was to build a rousing fire on the hearth. Generosity and huge open fires always go together.

We can scarcely return to the fires of the middle ages—a hearth larger than the parlor in a city house, and a chimney wide enough and sloping enough to drive a coach and four up, the fire replenished with a whole tree at a time. Grandgrind tells us that in so many—so very many years our American continent will be entirely denuded of trees, at the present rate of consumption, but in spite of that terrible possibility—somewhat robbed of its terrors by its extreme vagueness, we long for a fire of fragrant cedar or crackling hickory with a mighty buck log, as the New Englander's call it, supporting the whole glowing superstructure of fiery coals.

We have all read of the humble but picturesque cottage, with its wide hearth, and shining andirons, while seated before the glowing fire is a trim and rosy damsel, busily knitting, or oftener, I am afraid, making patchwork quilts of fearful and wonderful design, and gorgeous brilliancy. Now that humble cot contains a stifling coal stove, and I fear the rosy-cheeked damsel is not altogether innocent of kindling the fire with the convenient but uncertain kerosene can. O tempores! O mores!

What was the ideal of comfort is now condemned as inconvenient and awkward, and like its contemporaries, the spinning-wheel and the stage coach, is only found either on the confines of civilization, or in the possession of the rich or curious. The recent revival of all old fashions seems to have brought open fires more into favor, but their palmy days are past, and we shall no more return to the glorious fires of our ancestors, than to a belief in witchcraft or the Philosopher's Stone.

GOLDEN GRAINS.

SUFFERING for the *right* is cleansing; as the waves of a stormy sea wash the bold rocks, so the storms of the soul wash out the stains of self .....

OUR troubles are like sharp edged tools, safe enough, and practically beneficial, but dangerous if handled too closely, and heedlessly. Every trial has in it a lesson of wisdom if we only learn it aright.....

LIFE is too short to nurse one's misery. Hurry across the lowlands, that we may linger longer on the mountain tops.....

HARD speech between those who have loved is hidden in the memory, like the sight of greatness and beauty sunk in vice and rags.

AT a recent dinner party the subject of eternal life and future punishment came up for a long discussion, in which Mark Twain, who was present, took no part. A lady near him turned suddenly toward him and exclaimed, "Why do you not say anything? I want your opinion." Twain replied gravely, "Madam, you must excuse me; I am silent of necessity. I have friends in both places".....

MR. POWDERLY is very conservative. In the circular just issued he is very severe on strikes, boycotts, riots, anarchists, and intemperance.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

HOUSE-KEEPING IN CALIFORNIA.—X.

MARY-WAGER FISHER.

AFTER dinner until half-past seven was the laddie's hour, when Anaximander read aloud for him his daily portion of "solid" reading, as the boy was in the habit of calling it. From November to March this reading embraced Huxley's Physiography, Geikie's Elements of Physical Geography, Lubbock's Ants, Bees and Wasps, and the first volume of Prescott's Conquest of Mexico—with all of which the child was greatly entertained—these books being quite within the mental range of a bright child of eight years of age, whose taste for reading has not been vitiated by Sunday School literature—which is all good enough morally, but vicious, intellectually. A volume from which he read aloud to me every afternoon was Parton's Captains of Industry—reading it twice through—a capital book for boys. While the evening reading was going on, I sat by and did the "darning and mending"—which increased in volume as the new clothes with which we had started from home began to show serious marks of wear. One morning I found a friend ripping apart a gown. "I wonder how it happened," she exclaimed, "that women are forever turning gowns upside down and backside before. Who ever heard of a man turning his trousers?" "I have—at least I have seen trousers legs cut off and turned front side back—but I suppose some woman did it," I replied. "The great drawback to us creatures, is our economy—in small things. We waste our time and our energies in patching and darning, and in trying to make one dollar go as far as ten. I do, I know, and I have to spur myself up to a great moral hight in order to be able to part with an old gown or an old pair of gloves." I was delighted the other day to find that at last there was a demand for old tin cans. A Chinaman came to the house, offering quite liberally for all the empty tin cans. They seem to have discovered that new tops can be put on, and the cans re-used, which will depopulate the back yards and dumping grounds. It forms also a new source of pin-money to women. Henceforth we will not only turn our gowns and darn our stockings, but carefully hoard tin cans! It is almost equal to a new avenue of employment.

"I think," continued, this young lady, "that I am not a normal woman. It seems to me every woman ought to like house-keeping; house work and the careful management required in a family. But *I* don't. I like study, and I begrudge every moment I have to give to such things. How is it with you?" If I am cogitating, or have a matter in my mind which I am turning over for thorough inspection, I enjoy doing housework and love dearly to sew. Having my hands occupied facilitates my mental activity. But when I am through with my thinking, I begrudge every moment I am obliged to give to manual labor, or to doing anything that I did equally well 20 years ago. If I had to earn my living at manual labor, I would prefer housework to a great many other things—to sewing, to serving as clerk, shop girl, or even school teaching. There is nothing degrading in housework—it furnishes variety, and it is an occupation in which one can make advancement. The objections commonly urged against doing housework by American girls are the sheerest nonsense. They simply allow one of the most profitable and agreeable occupations to be taken from them and absorbed by the scum of foreign lands. A thoroughly capable and efficient American girl, who is *well* trained, knows how to cook excellently, how to manage her work and keep tidy; can command from five to six dollars a week, with room, board and washing, in rich families, providing she is entirely responsible and trustworthy. It is very difficult to obtain such service, and a servant of that character never need fear that she will fail to be respected and valued by her employers. But as for *all* women liking housework, because they are women, seems to me absurd. We have the same ancestry as have men, and it is but natural that we inherit the same tendencies. I think more women would contribute to the arts and sciences, if the feeling and traning were not so general,

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

that women should confine themselves to "women's work." I think some men who are very poor bricklayers might have made excellent cooks, and some women who are very poor housekeepers might have made very successful merchants. As things are now, we drop like so many pegs in so many holes; sometimes we harmonize with the environment and sometimes not. But every occupation is largely humdrum that is of much use. At least, men say theirs are monotonous and full of drudgery."

"In the millennium," laughed my friend "I suppose every creature will find his workin harmony with his disposition, and everything will be lovely! A way will have been found by that time to dispense with all disagreeable work, and the race will swim in a sea of happy delusion!"

Anent inventions by women, I noticed in the Report of the Women's Department at the New Orleans Exposition that a Rhode Island woman had a patent for an Improved Ventilating chimney; a New Yorker for a patent Invalid Bed; Pennsylvania women had patents for an Adjustable Window Cleaner, machine for Hooping Barrels, Improved Drawers for Children, Extension Stair-rod, Hot Air Vapor Apparatus, and model of Improved Railroad Car Seat; from Illinois women, came Portable Wire Screens, Combination Cottage and Arbor Folding Bed, Safety Rubbers, Portable Nursery Chair; from Iowa, Fly-screen Door Attachment, Step ladder, Thermometer to facilitate cooking and baking, Ironing Table, Silver-plated Carriage Tip and Wagon Tongue, patents and inventions from California women included Applied Button-hole, Hook and Eye, Reading Stand, Window Attachment and Dust Pan. The dust pan into which you can sweep the dirt without bending down to hold it, is very good. Among other inventions by women I noted Kitchen Maize Cutter, Flexible Halter, Soap Holder, Cistern Spout Trap, Self-Heating Flat Iron and Long Handled Dust Pan. Of those women inventors, who received awards, five belonged in Pennsylvania, three New York, two New Hampshire, seven Massachusetts, seven Illinois, one Iowa, three California, one Michigan, one Kentucky, one Connecticut and three Indiana. The variety and hope of the inventions are certainly creditable.

A JULY DINNER.

Tapioca Cream Soup.
Soles Stewed Jewish Fashion.
Veal Cutlets a La Milanaise. Potato Snow.
Bee Croquettes. Cucumber Toast.
Swiss Pudding.

Make one quart of white stock. This can be done with a ten-cent knuckle of veal, or from the water in which a chicken has been boiled, but no roasted or dark meats must be used, and only white pepper in the seasoning. Soak three even tablespoonfuls of tapioca over-night in cold water; add it to the stock, together with one small onion, two stalks of celery cut in bits, and a tiny piece of mace; stew these very gently for one hour; have in another vessel a pint of boiling milk or cream; strain the tapioca and stock and add it to this; season with salt, pepper and a tablespoonful of butter cut in bits.

Soles stewed Jewish fashion are a very nice fish course for warm weather. Cut up two large onions in slices, lay them flat in a stew-pan with an ounce of butter and just enough water to cover them, first seasoning with salt and pepper; simmer until tender. Cut in comely pieces a pair of flounders weighing about one-and-a-half pound each; lay them on the top of the onions and let them cook gently until the flesh lets loose from the bones; take out the fish and onions and lay them on a dish; strain off the liquor, and when cold stir into it the juice of two lemons beaten up with the yolks of three eggs; return it to the sauce-pan; let the whole get hot again but not boil; sprinkle the fish and onions with finely minced parsley and pour the sauce over the whole.

Veal cutlets are a delicious change from the ordinary methods, when prepared as follows: Trim some cutlets into a neat and uniform shape, and dip them in melted butter, then into bread-crumbs, to which grated Parmesan cheese has been added in the proportion of two tablespoonfuls of the cheese to six of the crumbs; the mixture should be salted and peppered. Dip again in beaten egg and again in the mixture of cheese and crumbs, and fry brown. Boil a small quantity of macaroni, about a quarter of a pound to eight or ten pieces of the cutlets; when done, drain it and pour over two tablespoonfuls of melted butter, two of grated Parmesan cheese, and half a cup of tomato sauce, to which has been added the well-beaten yolk of an egg. Place this macaroni in a pile in the center of a dish, and the cutlets in a circle around it. In the preparation of the maccaroni no mention was made of seasoning, but it must be boiled in salted water and salt and pepper be added with the butter, cheese and tomato sauce.

It is a strange thing that the simplest dishes are generally the most poorly done by the majority (and a big one at that) of cooks. There is not one in a hundred who will properly prepare a dish of mashed potatoes, a fact that I can only explain on the ground of laziness, for it really takes muscle to do it properly. After beating and mashing as fine as possible with a potato masher, have ready a small quantity of hot milk, into which a generous lump of butter has been melted, and the seasoning added. Then with a four-pronged fork, beat the potatoes as you would whip eggs, adding the milk and butter, until the whole mass is light and foamy. You can make it as soft as you like by adding the milk. If a great deal is used, it becomes potato soufflé. For the dish named above, it just requires to be light and feathery so that it can be heaped up on a dish in irregular masses. It is sometimes pressed through a sieve, which looks very pretty, but it is a great deal of trouble, and is very apt to cool too much in the process.

Beef croquettes make an economical little side dish at dinner. Take one cup of lean beef chopped as fine as possible, with half as much cold boiled ham and a little of the fat of the roast beef; season with a teaspoonful of finely chopped onion, salt, pepper, a trifle of sage and grated lemon peel. Put half a cup of stock in a stew-pan, and when it boils stir in a teaspoonful of flour wet with cold water, then the minced meat and a well-beaten egg. Form into croquettes, dip in egg and bread-crumbs and fry in boiling fat.

Peel crisp cucumbers, cut in slices lengthwise, lay for a half hour in salted cold water; drain and dip each slice in flour, and fry quickly to a light brown color in hot beef drippings or butter. Place each slice of cucumber hot from the pan between thin slices of hot buttered toast, seasoning them first with pepper, salt and a little mustard if liked, and serve at once.

Swiss Pudding.—Put a pint of milk over the fire in a double boiler, with the grated rind of a lemon; as soon as it boils, pour it slowly over a teacup of flour, through which four tablespoonfuls of butter have been rubbed; return to the boiler to cook five minutes, stirring for three minutes. Then stir in the beaten yolks of five eggs and three tablespoonfuls of sugar, remove immediately from the fire and set away to cool. When cold, add the whites of five eggs whipped to a froth, put it into a three-quart mould well buttered, steam for 40 minutes, turn out upon a hot dish and serve at once with a sauce made by beating to a cream half a cup each of butter and powdered sugar, then add a little at a time four tablespoonfuls of wine and a gill of cream.

PALMETTO.

HINTS ON HOMELY TOPICS.

SWEEPING AND DUSTING.

"Set thine house in order."

To the wise and experienced housekeeper these are trivial subjects, but since this is the season when "a young man's fancy lightly turns to thoughts of love," it is quite probable that there will be some housekeepers who will be willing to listen to "words of wisdom" from the RURAL. It is a peculiar fact that if a lady who may never have been called upon to handle a broom, should find it necessary to sweep a room, she will do it better than nine-tenths of the professed servants who have been to the manner born. This is because she will use some intelligence in the manner of performing her task. I am forcibly reminded of this fact every time the hotel chambermaid enters my room for cleaning purposes, an especial misnomer in this case. The dust routed from the floor whirls madly from the room, and then this "velvet bloom of time" settles quietly down again upon carpet and vase and easy chair, and truly the last state of my room is worse than the first.

But to proceed with my prosy details, since it is always quite as important to tell how a thing *should* be done as to tell how it should *not* be done: the first step is to dust all moveable pieces of furniture, with a large square of soft, old calico, or something that is not linty, removing them to another room. Rugs should be sent out-of-doors for a thorough beating, curtains and portieres shaken and pinned up, bric-a-brac dusted and placed upon a table or some article of furniture that is too large to be removed; all such pieces, after a good dusting, to be pinned up in old cloths kept for the purpose. Worn sheets or the skirts of old calico dresses, sewed together so as to cover each piece completely, can always be kept ready. I once knew a housekeeper who always had her beds changed on Friday so that she could use the soiled sheets for covering the furniture on sweeping days. I do not, however, recommend this practice. Having made these preparations, if the carpet is a very dusty one, tear some old, soft newspapers in shreds, soak them in water, squeeze them out lightly, and scatter over the floor, then with the broom sweep in long even strokes, letting each stroke end on the floor instead of in the air as is the usual fashion of housemaids. If it is a room that is only swept occasionally, it will pay to give it a second sweeping, omitting the wet paper, then take a large pail of clean warm water in which a handful of salt and a tablespoonful of pearline have been put, and an old flannel cloth, wring the latter out and wipe the whole carpet, a small piece at a time, rinsing out the cloth frequently and changing the water if it becomes too dirty. The carpet, even if an ancient one, will astonish you after this "Turkish bath," by its bright cheerful look. Allow a short time for the dust to settle and then finish the task so well begun, by dusting window frames, cornices and all the woodwork; if the latter is soiled wipe it with a soft cloth dipped in the same preparation that you used for the carpets. The work of dusting the furniture that had been covered will be very light, but it will pay to rub it well with an oily rag, using kerosene oil, but only a very little of it. The efficacy of this application depends not so much upon the oil as upon the amount of elbow grease that is employed, if you will excuse this homely expression.

There is so much more satisfaction in doing anything that has to be done in a thorough and workman like manner, that since "cleanliness is next to godliness," one may be excused if while performing a labor of this kind she should think of George Herbert's beautiful lines:

"Who sweeps a room as to thy laws
Makes that and the action fine."

BESSIE.

KEROSENE IN WASHING.

IN RURAL for May 29, a correspondent asks for information in regard to using kerosene oil for washing.

The rule as given to me is: one five-cent bar of soap shaved up fine, to four pails of water, and two-and-one-half tablespoonfuls of kerosene oil. Add the soap and water, when the soap is fully dissolved and the water boiling, add the oil and then the clothes, watching the clock to be sure they boil just 10 minutes, no more, no less. I was not satisfied with the result and experimented. My boiler was made for my stove and holds over a barrel of water, for 16 pails of water I use one or two cakes of soap, according to size and condition of wash. While the water is cold, I place the sheets on the bottom of boiler, then add the soap shaved finely, scattering it as evenly as possible, then the rest of the clothes, rubbing soap on the neck and wrist-bands of shirts, lastly adding the kerosene oil, four spoonfuls to the 16 pails of water, and let them stand until they have boiled 10 minutes, then take out of the suds, rinse, and hang out.

SUBSCRIBER.

I WAS greatly surprised in reading the short article with the above heading, in the RURAL of May 29th, to learn that our Eastern sisters have not discovered the excellent qualities of kerosene for cleansing purposes. I have used it for washing a long time, and would not wash without it now; my clothes are whiter than when I employed a wash-woman, and it does not hurt me in the least to do my washing, which I cannot do the old way, and by the time they are ironed the unpleasant smell has all evaporated. The night before, put clothes to soak in warm water with enough soap dissolved in it to make a good suds. In the morning wring out, if very dirty, rub lightly in the hands; put in the boiler with cold water, two-thirds of a bar of soap, and two large tablespoonfuls of kerosene, let boil at least 20 minutes after they come to the boil; when taken out, let cool enough to put through the wringer again, then rub through clean water, blue and starch (with a little of the oil in the starch) and your clothes will satisfy the most fastidious.

MRS. S. A. BROZENON.

BREAKFAST PUFFS.

Take in the proportion of one cup of flour, one cup of milk and one egg; beat the egg very light and have the freshest milk obtainable, and be sure to sift the flour. Put in well greased and well-warmed pans—gem pans or the small, narrow pans that savoy biscuit are baked in are the best, but cups or muffin-rings will answer—and have your oven very hot.

COTTAGE CHEESE PUDDING.

Take two cups of cottage cheese and mash it with a spoon; add to it three eggs, one at a time, beating well each one into the cheese, as much sugar to sweeten it to your taste, together with one tablespoonful of flour, a pinch of salt, a grate of nutmeg and sufficient milk to make the mixture a little thicker than custard. Have a pie-plate lined with rather rich paste and strewed with sugar, in which put your pudding, sprinkling the top before baking liberally with finely powdered cinnamon.

AUNT ADDIE.

Miscellaneous Advertising.

Debility

Languor, and Loss of Appetite, are cured by the use of Ayer's Sarsaparilla. It removes that terrible sense of *Constant Weariness*, from which so many suffer, gives tone and vigor to the stomach, and restores health and strength more surely and speedily than any other medicine.

Three years ago I suffered from Debility and Loss of Appetite, the result of Liver Disease. After having tried various remedies, and consulted several physicians, without benefit, I was induced to take Ayer's Sarsaparilla. The first bottle produced a marked change, and the second and third accomplished so much that I felt like a new man. I have, since that time, taken about one bottle every year, and had no recurrence of the trouble.—William E. Way, East Lempster, N. H.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

HIRES' IMPROVED ROOT BEER. Packages, 25 cts. Makes 5 gallons of a delicious, sparkling and wholesome beverage. Sold by all druggists, or sent by mail on receipt of 25 cents. C. E. HIRES, 48 N. Delaware Ave., Philadelphia, Pa.

FARMERS,

Send for Circulars and Price List of The BARNES PAT. IRON FENCE, the cheapest and most durable fence in the world. Address THE BARNES PAT. IRON FENCE CO., EASTON, PA.

Brewster's Patent Rein Holder.

Your lines are where you put them—not under horses' feet. One agent sold 12 doz. in five days; one dealer sold six doz. in 15 days. Samples worth $1.50 FREE. Write for terms.
E. E. BREWSTER, Holly, Mich.

FRUIT DRYERS

PRICES GREATLY REDUCED. Send for Circular.
ZIMMERMAN M'FG CO., BURLINGTON, IOWA.

EVAPORATING FRUIT

A N immense stock of Trees & Plants for sale. Write at once for Catalogue & Terms. Don't pay others Double Prices.
LOCAL TREE AGENTS WANTED. Parties are doing well selling for us. Sell a bill of stock to your neighbors and by so doing get your own free. A. M. Purdy, Palmyra, N. Y.

News of the Week.

HOME NEWS.

SATURDAY, July 3, 1886.

WEDNESDAY last, June 30, was the end of the National fiscal year, as all government accounts run from June 30 to June 30, instead of from Jan. 1, to Jan. 1.....The Treasury statement issued Thursday shows a reduction of the National debt (less cash in the Treasury) of $9,061,818 for the month ending June 30. The receipts and expenditures for the fiscal year, compared with the last preceding one, show an increase of revenue of about $12,500,000, and a decrease in the expenditures of about $14,500,000. Customs receipts are some $11,000,000 better, internal revenue $4,500,000, and miscellaneous some $3,000,000 less. The ordinary expenses are $22,400,000 less than last year, interest is nearly $1,000,000 less, and pensions are $8,600,000 more..... ....The Fitz John Porter Bill which has passed the Senate by 30 to 17, has been signed by the President.....The Illinois Prohibitionists, in their State Convention at Springfield Thursday, adopted a cold-water platform, nominated Henry W. Austin, of Oak Park for State Treasurer, and U. Z. Gilmer of Quincey for State Superintendent of Public Instruction, appointed committees, and adjourned. Prohibitionists extremely active and independent everywhere; belligency, too, is not confined excessively to the "rum interests."..... The first through train on the Canadian Pacific Railroad for fire-swept Vancouver, the Pacific terminus, left Montreal on Monday night, June 28. It is not improbable that the first train eastward will bring with it a large consignment of tea for the Eastern States. About 100 carloads were offered some time ago to leave Yokohama for Vancouver. This fact was recently announced by Mr. Van Horne, the Vice-President of the railroad, who said that the teas were to be carried over his line and distributed not alone in Montreal, Ottawa and Toronto, but in St. Paul, Chicago, New York, and the New England States. This consignment will make a beginning of the trade which the managers of the Canadian Pacific hope to open up with China and Japan. The road will not only bind the extreme east and west of the Dominion—an immense advantage politically—but it will help to open up the intervening country, and afford a passage for British troops on British possessions around the globe. It will also bring much Eastern trade to Canada..... ....The manufacture of rubber has increased enormously of late. It is now very nearly five times as great in the United States as it was 16 years ago. In 1870 our imports were only 5,132,000 pounds, while last year they aggregated 24,871,000. We lead the world in the consumption of rubber goods, taking about 70 per cent. of all that is produced on the face of the globe. There are about 30 rubber factories in the United States..... ....When the Beck Railroad Attorneys' Bill was referred to the Senate Judiciary Committee, Senator Edmunds, Chairman, promised to report it for Senatorial action within eight days. He didn't do so; but so great is the outside pressure that it will probably be reported after the railroad Senators shall have so amended it as to remove all the "reflections" upon them, which they professed to recognize in it, especially if in the process it is emasculated of the best features.....Money to help the elections of Home Rule candidates in the United Kingdom is being generously contributed by all parts of this country and Canada ....Of the 214 church picnickers poisoned at Flemington, N. J., one has already died and several others are still in danger. It is now thought that the ice-cream, not the spring, was maliciously poisoned with arsenic. A man suspected, but no arrests yet..... From present appearances Blaine and Cleveland are likely to be again the candidates of the Republican and Democratic parties at the next election. It is thought, however, that the Democratic ticket should be: "For President, Mrs. Frances Grover Cleveland; for Vice-President, Mr. Grover Cleveland. Platform—In Union there is Strength." No doubt whatever that the union of Frances and Grover has added immensely to the political strength of the latter.....Another California petition, with 50,000 signatures, was presented to Congress Monday for a law prohibiting Chinese immigration absolutely forever. The treaty with China provides that such a law must not be passed, and one side alone cannot abrogate a treaty; it must run until its limit is reached, unless China will agree to the new legislation, and of course that's unlikely.....The will of Col. Folsom, Mrs. Cleveland's grandfather, was probated Monday. Property left among his eight grandchildren, share and share alike. Each, including Mrs. C., will get about $20,000, instead of the $50,000 expected. If the property improves they will get more. Some Western land has to be held till all are "of age."..... In Cuba 25,000 slaves were set free between May 8, 1885, and May 7, 1886.....The Knights of Labor appeal to Speaker Carlisle to urge the passage of the following measures before Congress, intimating that as the Democratic Party has a majority of "some forty" in the Lower House, it should be held responsible if the bills are not passed: 1. House bill repealing Timber Culture, Pre-emption, and Desert Land Acts. 2. House bill for the adjustment of railroad and other land grants. 3. Bills forfeiting all railroad land grants the conditions of which have not been strictly complied with. 4. House bill organizing the Territory of Oklahoma. 5. Senate bill opening a portion of the great Sioux Reservation to settlement. 6. Bills prohibiting aliens from holding land in the United States. 7. Bill making Presidential and Congressional election-days holidays, and punishing bribery. 8. Bill directing disbursement of at least $200,000,000 Treasury surplus, and substituting Treasury notes for bank notes retired..... .. ....Gov. McEnery, of La., appeals for help for the sorely distressed people in portions of the parishes of Rapides, Grant and Catahoula, which have been flooded and terribly afflicted by storms of wind and rain. The crops have been totally destroyed, cattle and hogs drowned, and the soil in many cases has been washed away to such an extent that it will be impossible to raise crops of any kind this year. .....A resolution of the Portland, Oregon, Board of Trade was lately presented to Congress protesting against the forfeiture of the Northern Pacific land grant for the uncompleted Cascade Branch. It turns out that the resolution was unauthorized and illegal, and it is to be expurged from the record..... ....There's a bill before the Senate to increase the annual allowance for arming the militia to $600,000 from $200,000, which was fixed before the year 1810, and is conceded to be inadequate in 1886. The House is likely to cut it down to $400,000, if it gets to it before the end of the session.....The Cardinal's cap was conferred on Cardinal Taschereau at Quebec by the envoy from the Pope last Thursday. Cardinal Gibbons, of Baltimore, has also been officially invested with the insignia of a "Prince of the Church."..... ....Some 12,000 bills have been introduced in Congress this season, three-fourths of which are House bills. Of the 3,000 introduced in the Senate, 448 are set down to Mr. Sawyer and 447 to Mr. Blair. No other Senator is guilty of half so many, though Mr. Sewell comes up with 205 and Mr. Van Wyck with 203. The Kansas Senators, Plum and Ingalls, respectively number 150 and 151. As to the character of these measures, Mr. Blair easily heads the list in the matter of nonsense. Mr. Sawyer's are doubtless mostly private pension bills, as he acquired great distinction some weeks ago in preparing an unprecedented number within a given time for presentation on the part of the Pension Committee. Mr. Kenna, of West Virginia, introduced the lowest number, two, if we except Mr. Jones, of Florida, who has been continuously absent, and who has presented none at all..... ....Mr. Morrison thinks that instead of a reduction of $9,000,000 in the customs revenue estimated by Randall to be brought about by his tariff bill, it would cause an increase, on the basis of last year's imports, of some $5,000,000. On the other hand, the loss of internal revenue he estimates at $36,000,000 in place of $20,000,000 as announced by Mr. Randall, the repeal of the tax on tobacco alone cutting off at least $26,000,000. There's no chance of any tariff legislation this session anyhow; but there's any amount of bitter talk about it, especially among the Democrats, to the immense joy of the Republicans.....Another Yankee fishing boat has been seized by the Canadians for getting ice and bait. Our neighbors say they have received no instructions or advice from the Imperial Government with regard to the fishery trouble, and that they intend to act just as they have been acting.....The President has approved the act to legalize the incorporation of National trades unions; the act granting a franking privilege to Julia Grant, and the bill to pension the widow of A. A. Semmes..... .....Assistant Sec. of the Treasury, W. E. Smith, of New York, has resigned, and Gov. Thompson, of S. C. has resigned the Governorship and accepted the place, which is very important during the illness of Sec. Manning. Smith goes west as chief counsel to the St. Paul and Manitoba R. R.; salary $15,000 a year. Thompson is young (comparatively) and has made an excellent Governor..... ... The "Breadwinners" was written jointly by Capt. Frank H. Mason and wife, now U. S. Consul at Marseilles, formerly journalist at Cleveland, O.—written abroad; brought over by John Hay, to whom the clever work was credited.....A good deal of disgust is reported at Amherst, Mass., over the shelving Prest. Greenough, of the Agricultural College. He didn't resign; nor was he removed; he simply failed to be re-elected..... Extraordinary romancing is telegraphed from Southern Dakota about an extensive military organization bent on setting up an independent State .. ....A part of last week and the whole of this have been consumed in trying to get a satisfactory jury to try the Chicago Anarchists. These have just made the convenient discovery that the rascal who threw the bomb was killed the next day in a struggle with a policeman.....The striking Chicago switchmen, backed up by the stockyard men, have been riotous several times during the week. Several trains on the Lake Shore Road derailed; others forced through under heavy guard of Pinkerton policemen and others. Considerable firing, and storms of stones.....

FOREIGN NEWS.

SATURDAY, June 3, 1886.

THE elections now going on in the United Kingdom are holding a dominant place in the attention of all English-speaking people, and a prominent place in that of all Christendom. The issue is now substantially narrowed down to some sort of Home Rule with land laws favorable to landlords under Salisbury, and a definite form of Home Rule with land laws favorable to tenants under Gladstone. Already, 87 Members of Parliament have been elected; most of whom were unopposed, and the majority of such are Conservatives. Of these, 52 are Conservatives, 10 Liberal-Unionists, 17 Gladstonians and eight Parnellites. The Liberals who do not favor Gladstone, generally do not vote instead of voting for his opponents. At the last election, the Conservatives started ahead in the same way, but were finally defeated. The cries now are, "The masses against the classes," on the Gladstone side, and "The safety of the Empire," on the other. The anti-Gladstonites have hitherto won two seats, but the Home Rulers expect to get 20 majority. The contest is extremely close, and both sides are fighting hard and well. It is still "anybody's battle," but the results of today's elections will indicate which side is likely to win. The first battle of the "masses," the poor, undisciplined, semi-ignorant masses, against the wealthy, trained, cultured "classes" is an up-hill fight, and with a divided Liberal party, it will be a glorious victory if Gladstone wins, and no shame whatever if he fails.

In France the expulsion of the Princes still continues to cause a great sensation. The Orleanists, Legitimists and Bonapartists are combining against the Republic. The Count of Paris's manifesto, in which he boldly asserts his rights to the throne, is held to prove the justice and expediency of the expulsion. The Republicans threaten to confiscate the property of the exiles, if they prove troublesome. Most of it is, however, invested in foreign securities, or so disposed of that it would be extremely difficult, if not impossible, to touch it legally.....The organization and movements of the French army are very active of late, as if some new step were contemplated. All the equipments, etc., are overhauled and put in prime order, all officers furloughed or detailed on special service have just been ordered to join their commands. General Boulanger, Minister of War, is very lively and energetic. Is it all through fear of a monarchical uprising, or on account of the late growls of Germany at French intrigue and hostility; or through some secret arrangement with Russia, which of all the European Powers would be most likely to side with France or seek French aid in a conflict with Germany and Austria, which are pretty certain to act together in the next war.

AGRICULTURAL NEWS.

SATURDAY, July 3, 1886.

OWING to heavy elevator charges on grain in Chicago, there was such danger of much of the grain trade going elsewhere that a change was made which went into effect on July 1, which cheapens the cost of handling grain for direct shipment fully 50 per cent. This aggregate of saving includes a remission of the charge hitherto made for switching the cars of Eastern lines to the elevators for loading, and the smaller fee for distributing the grain evenly in the car..... An immense swarm of June bugs settled down on Pekin, Ill., Monday evening. Millions of them flew against an electric light on a street corner and were burned to death. Five wagon loads were gathered up afterwards from the ground beneath the lights, and thrown into the Illinois River .... .. Gen. Boulanger, French Minister of War, having purchased foreign oats for the use of the army, was called to task in the Chamber of Deputies Thursday. He said the supply of French oats was insufficient, and that foreign oats were cheaper and more suitable. The Chamber declared, by 273 to 263 votes votes, that it was convinced the Government should henceforth give contracts to French farmers whenever it is possible to do so.....Some time ago the Penn. State authorities thought they had stamped out contagious pleuro-pneumonia among cattle in Lancaster Co.; but it has again broken out virulently among the herd of Henry Bend, of Turkey Hill, near Lancaster—affected animals killed.....The Collector of the Customs at Corpus Christi, Texas, reports that a total of 32,884 sheep were imported from Mexico into Texas from January 1 to March 31, of which 30,144 were admitted free "for breeding purposes," and every one of them had a heavy fleece. None will be admitted hereafter unless careful investigation proves that they are imported specially for breeding, in which case they ought to be choice animals.....The appeal of the Penn. Agricultural Society to the Legislature for State aid to get rid of its $25,000 debt, having been received unfavorably, it now asks subscriptions from 500 "prominent Philadelphians"..... ....The Senate Committee on Agriculture has reported favorably, with substantially no alterations, the House Oleomargarine Bill. Action will be urged upon it as soon as the pressure of appropriation bills is over. Some say it will be talked to death by the Senate on motion to refer it to the Judiciary Committee. Others say it will be amended so as to reduce the five-cent tax to three cents, and then passed; but even then the President's action is considered doubtful.....

Where Florida Failed.

ONE of the favorably known merchants of New York—one who has been planted and rooted for a long time in the same place—is Mr. J. H. Johnston, jeweler, of No. 150 Bowery, New York, where he has been established over thirty years.

Mr. Johnston has one of the cosiest suburban homes in the vicinity of New York, situated at Mott Haven, just across the Harlem River, in the northern part of the city. His wife is a most estimable lady, and is known as a writer of marked ability. Those who see her now, in the enjoyment of excellent health, would hardly suppose that four years ago she was an invalid wavering between the love of life and a constant prospect of death. To one of our correspondents who visited her Mrs. Johnston said:

"When I went to Washington to attend the inauguration of President Garfield I was exposed in stormy weather and caught a severe cold. It settled on my lungs, producing serious results, among which were an obstinate cough and sharp pains in my lungs. Mr. Johnston became alarmed and took me to Florida the following winter. I was by this time unable to sit up for a moment, and was with great difficulty conveyed to the steamer; overhearing the remark from a bystander, as I was being transferred from the carriage to my birth, '*there goes another to be brought back in a box.*" The sunny days partially restored my health, but on the approach of winter again my cough increased and strength vanished. My appetite was entirely gone. I swallowed food in daily decreasing quantities, and from a sense of duty only. Still, I fought the idea that I had entered on the decline that ends in death.

"I had heard of Compound Oxygen and I determined to investigate it. My husband and I went to Philadelphia to learn its merits at headquarters. Dr. Starkey examined me, told me what I already realized, namely, that my case was a serious one and that unless the hemorrhages were checked I would not live over three months. I was deeply impressed with his earnestness. I tried the Compound Oxygen at once and found a prompt benefit. This increased daily and the cure eventually proved permanent. I was inspired with an enthusiasm for life to which I had long been a stranger. The weary, nervous depressions to which I had yielded gave way to sunshine and hope. The pain in my lungs gradually faded away and the severe aches in my side no longer afflicted me. My sleep, before restless, became even and quiet. Shortness of breath was succeeded by a facility for using the full breathing power of my lungs. My capricious appetite became a natural one, and I began once more to enjoy life. Though I believe myself cured, I exercise care in avoiding exposure to colds. I always keep the Compound Oxygen in the house and take it on the slightest provocation. It always acts beneficially.

"I ascribe my cure to Compound Oxygen alone, as I took no other medicine, and the weather prevented any out-of-door exercise. However I never used it according to directions, but in sudden attacks of congestion or threatened pneumonia have taken it as it could be inhaled, every few minutes until relieved from the pain and suffocation, and when able to live in the sunshine took the Compound only before retiring. I really believe it is *the remedy* for all lung diseases, and you are at liberty to use my name in recommending it."—*Adv*

Crops & Markets.

SATURDAY, July 3, 1886.

Dispatches from Otsego County, N. Y., report that the hop vines generally throughout that section are literally covered with lice from the bottom of the strings to the top of the poles. Honeydew is also found wherever the lice are, and this is fully as bad as the vermin. So there are, in fact, two pests working the destruction of the crop. The dew is a companion of the lice, though there is an occasional vine on which only the dew appears. Either is ruinous. The extensive appearance of lice in June leaves no hope for the crop, and unless some sudden and unforseen change shall occur there will be no hops to harvest. The leaves attacked by lice curl up and dry, and mold follows in the hops before they mature. The lice usually appear in August. Then the growth of the hops is so far advanced that the vermin can do little damage. Reports from Southern Oneida and Madison Counties are also to the effect that lice are so numerous as to threaten the total destruction of the hop crop.

The interest in wool has gone westward from the Central Western States (Ohio and Michigan) to Montana, Wyoming and Utah, where prices are held comparatively higher than those in the Eastern markets. The clip east of the Mississippi has been mostly cleared up out of growers' hands, more largely by local speculators than by Eastern dealers and manufacturers, prices having risen from one to three cents per pound within 10 days, so that growers who heeded the information and suggestions here given have gained considerably. Favorable advices of the colonial wool sales at London help to stiffen figures. Manufacturers at Boston now readily pay two cents a pound more than was asked a fortnight ago. The general opinion is that although there may be slight reactions during the rest of the year, prices are not likely to drop much, if any, below current quotations. Mill owners are, therefore, stocking up freely.

Prices for leading descriptions of wool at Boston are as follows:

Ohio and Pennsylvania X	32@33c.
Ohio and Pennsylvania XX	33@34c.
Ohio and Pennsylvania XX and above	35c.
Michigan X	32c.
Fine Ohio delaine	33c.
No. 1 combing	36c.
Texas spring, 12 mos	21@24c.
Super A	31@37c.

The market at Philadelphia is very strong and for some grades one-half to one cent higher, with a general upward tendency in sympathy with the West. Demand is active but business is crippled by the light stocks. Supplies of old wool are about exhausted and receipts of new are very light and are quickly marketed.

MARKETS BY TELEGRAPH.

SATURDAY, July 3, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 2c. higher; No. 2 Spring, 1¾c. higher. Corn, ¾c. lower. Oats, ⅝c. higher. Rye and barley steady. Pork, 90c. higher. Lard, 42½c. higher. Cattle, lower on all grades. Hogs, from 15c. to 25c. higher. Sheep, from 15c. to 30c. lower.

WHEAT, active; Sales ranged: July, 73@74¼c; August, 75@76¼c; Sept., 75¾@77¾c; No. 2 Spring, 72¾@74¼c; No. 3 Spring, 69@69½c. CORN brisk; sales: Cash, 33⅜@33¾c; July, 33⅝@33⅞c; August, 30@30¼c; September, 37⅝@37¾c. OATS.—Active. Sales ranged: Cash, 27⅞@27½c; July, 27¼@27⅜c; August, 26⅛@26⅜c; September, 26@26¼c. RYE.—No. 2 at 56c. BARLEY.—No 2, at 53c. MESS PORK.—Cash, at $9 75@10 15; July, at $9 90@10 15; August, at $10 02½@10 42½; September, at $10 20@10 45. LARD.—Cash, $6 45@6 60; July, at $6 50@6 60c; August at $6 70; September, quoted at $6 70@6 83½. BULKMEATS.—Shoulders quoted at $5 50@5 45; short rib sides, at $6 95@6 10; Short Clear sides, at $6 40@6 45. CATTLE—Market brisk and steady. Shipping steers, at $3 60@5 50; stockers and feeders, $2 50@4 35; cows, bulls and mixed at $1 75@3 90; bulk, $2 50@3 00; through Texas cattle, $3 80@3 85. HOGS.—Market active. Rough and mixed, $4 24@4 40; packing and shipping at $4 50@4 57; light, $4 25@4 75; skips, $2 75@4 00. SHEEP.—Market quiet and weak; Natives, $2 20@3 40; Texans, at $2 25@3 25; Lambs, per head, $1 25@3 75.

ST. LOUIS.—Compared with cash prices a week ago, No. 2 red wheat is 6c. lower, while July wheat is ⅛c. higher, and August, 1¼c. higher. Corn, ½c. higher. Oats, ⅜c. higher. Butter, Creamery and Dairy, 4c. higher. Eggs, steady. Flaxseed, 4c. lower. Pork, $1 higher.

WHEAT.—No. 2 Red, Cash, 71@71½c; July, 71c; August, at 74½@75c; September, at 77½c. CORN.—No. 2 mixed Cash, quoted at 30@30¾c; July, at 30⅝c.; August, at 35c. OATS.—Quiet; No. 2 mixed, Cash, at 27@28¼c.; July, at 24c; August, 24½c. RYE steady at 55c. BUTTER.—Quiet; Creamery, 15@16c; dairy, 12@14c. EGGS.—Quiet at 8½c. FLAXSEED at $1 00@1 01. HAY.—Timothy, $10 00; Prairie, $4 50. BRAN, 45c. at the mill. PORK, $10 50. BULKMEATS.—Long clear, at $6 10; short ribs, $6 20; short clear, $6 25. LARD.—Steady at $6 30@5 35.

BOSTON.—CORN.—Corn steady, but only fairly active; Steamer yellow, at 46@47½c, and steamer mixed at 46@46½c. OATS.—Firmer, with an improved demand and higher prices; No. 2 white, at 39½c; shorts and provisions steady and unchanged. HAY AND STRAW.—Choice prime hay at $18@19; fair to good, at $15 00@17 00; East, fine, at $14 00@17 00; poor to ordinary, $11 00@14 00; East swale, $10 00@11 00. Straw.—Rye straw, choice, $20 00; Oat straw, at $10@11 per ton. Truck.—Cabbage, per bbl, $1 25; Bermuda onions, per crt, $1 85; rhubarb, $1 per cwt; radishes, per 100 bunches, $2 50; lettuce, per box, 75c; native cucumbers, 4c; bunch beets, 4@5c; bunch turnips, 6@7c; native peas, $1 50 per bushel. Poultry and Game.—Western turkeys, frozen, No. 1, 14c; No. 2, 10@12c; spring chickens, 25@30c; fresh killed, near-by fowls, 12@14c; live fowls, 10c; Western frozen chickens, 10@12c; Western fresh killed fowls, 10@11c; green geese, 18@20c; green ducks, 18@20c. PRODUCE.—BUTTER.—Western extra fresh-made creamery, 17¼@18c; do. extra firsts, 17c; do. firsts, 16@16½c; imitation creamery extra, 14@15c; do. extra firsts, 12@13c; do. fresh factory, choice, 12c; fair to good, 10@11c; do. common lots, 8@9c; Eastern creamery, good to choice, 17@18c; Northern creamery, extra, 19c; extra firsts, 17½@17c; Vermont dairy, extra, 17c, do. firsts, 15@15½c; do. fair to good, 13@14c; New York dairy, extra, 16½@17c; do. extra firsts, at 15@16c; do. firsts, 14c; do. fair to good, 12@13c; low grades of butter as to quality; the above quotations are receivers' prices for strictly wholesale lots. Jobbing prices 1@2c. higher. CHEESE.—Choice Northern, 8c; do. sage, 8¼c; Western, 7¾c; lower grades according to quality; jobbing price, ¼c. higher. EGGS.—Near-by, 15@15½c.; East extra 14½@15c; New Hampshire and Vermont extras, at 14½c; New York extra, 14@14½c; Western choice, at 13½c; Michigan extra, 14c; Nova Scotia, 14c; Northern, 14c; Island, 13c; jobbing price, 1c. higher. BEANS.—Choice small New York, hand-picked pea, at $1 55@1 60 per bushel; choice New York large hand-picked $1 50@1 55; small Vermont hand-picked pea, $1 70@1 80; choice screened pea, $1 35@1 40; hand picked medium $1 45@1 50; choice screened, $1 15@1 20; common do, $1@1 10; choice improved Yellow Eyes, $1 45@1 50; old-fashioned yellow eyes, $1 40@1 45; Red Kidneys, $1 70@1 75; can peas, 85@90c, for roasting, and 95c@$1 for choice; green peas, $1 30@1 25 per bushel for choice West; 90c@$1 for North. Jobbing price, 10c. higher. POTATOES, old, 75@80c, per bushel; new, Norfolk, $3 00 per bushel; medium do, $2@2 25.

PRODUCE AND PROVISIONS.

I WILL INSURE YOUR HOGS!

DR. JOS. HAAS'

HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]

Is the only Practical Preventive of the so-called Swine Plague.

It has never been surpassed as an increaser of pork and general system tonic. Aiding digestion, stimulating the biliary organs, preventing torpor and engorgement of the liver, and regulating the bowels, it removes and prevents the formation of disease germs, and preserves to the well bred hog his natural constitution. Where it has been fed to such animals in the prescribed quantities, and other directions faithfully observed, it has proved a thorough preventive against swine disease.

AS AN EVIDENCE OF FAITH

In my remedy I make the following offer:

1. I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my remedy under my direction and prove upon examination prior to contract that they are in a healthy condition, and are neither in-bred, close-bred nor the progeny of such.

1. I will forfeit $100.00 to any breeder whose offer to examine for insurance I decline, provided he forwards remittance to cover my expenses to and from location of hogs, or I fail to prove to the satisfaction of any disinterested party, that failure to respond to invitation is caused by prior engagement or by matters of at least equal importance.

2. I will forfeit $500.00 if I decline upon examination to insure such herds, if my judgment as to their condition of health is overborne by the result of an examination made by at least two properly qualified and graduated veterinary surgeons.

Facts are Better than Assertions.

Please read the following testimony:

GIBSONTON P. O., PA., Feb. 2, 1885.

Dr. Jos. Haas—Dear Sir: About a year ago our herd here numbered about 2,700 head. Disease broke out, and no remedy we had would arrest the trouble. Our losses were heavy and we had to give up feeding entirely for about two months. We then heard of your remedy and bought a trial lot, and began feeding again. We have used it constantly ever since. We have since April last received about 5,000 head of hogs into our herd and have not had a single death from swine disease. This is our experience. Our opinion is that the remedy has prevented disease, and we would not think of being without it. As an aid in fattening pork, we believe it to be good. On this point, however, we have not made an actual test, *as we would not risk feeding a pen of hogs without the Remedy.*

Yours very truly, WHITE & CO.

[N. B.—White & Co., since writing the above letter, have purchased $450 worth of the remedy.]

The remedy can be procured of all Druggists, or from my laboratory. Prices, $2.50, $1.25 and 50 cts. per package. 25 lb. cans, $12.50.

For the Young.

THE OLD SCRUB.

She stands there alone with her back like a rail,
Not a beautiful line from her head to her tail,
With one horn turning in, and the other a stub,
This bony old creature—the scrubby old scrub.

She hasn't an ounce of "blue blood" in her veins,
She don't know enough to go in when it rains;
Her hide bears the marking of stone and of club,
And yet she is patient—the scrubby old scrub.

Yes, these are her children, they haven't a trace
Of her scrubbiness left—see the scorn on their face
As they look at the patient old scrub by the gate,
And wonder and wonder what iron-willed fate

Has thrown such a bundle of bones in their track.
Could they turn the great curtain of weary years back
And see how the patient old scrub worked alone,
Without petting or praise, they would surely atone

For their conduct—they hook her and drive her about,
She is ugly you know—they would soon drive her out,
When a face shows the deeply cut markings of care
We are apt to forget it was once young and fair.

And yet, she's the best of the whole herd to me,
As I think of her long years of service, you see,
There's a soft spot on memory where she can rub;
She shall live her life out—this poor scrubby old scrub.

We are having pleasant weather again. How the plants enjoy the sunshine! You can almost see them grow. The corn seems almost alive and the melons are fairly racing with each other. Now is the time to pick out a strong melon vine and make it earn one of the prizes. I hope the weeds are all cut down. It seems a shame to let them grow up and enjoy this beautiful weather. Now is the time to make the hoe do double work. Work counts as it never will again during the season.

How did you spend the Fourth of July? I hope you all had a good time. I hope the cannon did not explode; that the fire crackers did not burn anybody and that the rain did not spoil the picnic. Somehow everybody seems to want to make a great noise on the Fourth of July. Why should they? I know a boy who used to think the world would all go wrong if he did not get a big tin horn to blow on the morning of the Fourth. He used to sit up all night before the great event and tire himself out, so that he was sure to go to sleep just when he wanted to be awake. One year he slept out in a barn and never waked up until it was broad daylight. Then it seemed as if the whole country was lost to him, but it never made any difference after all. I would gladly have all the tin horns thrown out of the celebration. We used to have great fun at the Fourth of July picnic. There was always a greased pig to chase and a tub race. Sometimes the pig would refuse to run and the tubs would all tip over, but that made all the more fun.

The bootblacks in the city always look at your feet. When they see a person with muddy shoes coming along, they are after him at once. Whenever they ask me if I want a "shine" I always begin to think that my shoes are not looking very well. Some of the bootblacks make considerable money. If they can save enough to buy a comfortable chair with a thick umbrella over it, so that their customers can sit at ease out of the sun, they think they have a good business. As in every other kind of business, it is the saving of the pennies and the little things that give them a start. Fortunes are not built up out of what we earn as they are saved out of what we refuse to spend. Bootblacks tell me that it pays well to keep their own shoes well blacked. I notice that they generally do this. Their faces and hands may be dirty, but their boots are always shining. A good polish acts as a fine advertisement. It shows that they understand their business. In any kind of business we always feel like trusting our work to those who give evidence that they know what to do. Bootblacking is pretty poor business, but I guess we would all do it before we would starve.

THE STORY OF A DISTRICT SCHOOL.

(*Continued.*)

It was to be my first season as a teacher. I knew nothing at all about the average district school. My own school-days had been passed at the East in a graded school where the pupils were held down to very strict rules. I had applied for the position in Bear Creek at the beginning of the Fall term, mainly because most of the other boys were making applications. The stories of putting the teacher out and of "boarding 'round," that the boys were fond of relating, had rather driven me away from the project. I had about decided to take a position on a stock farm, when the letter from the Bear Creek Director captured me.

Somehow the long, formal sentences and the legal rhetoric gave me an exalted idea of the position. I knew nothing about Bear Creek. A friend some 50 miles away had told me about the school, and I had sent my application without serious thought. To my eyes, viewed from the frame-work of this letter, the place seemed like an ideal community. No pupil capable of putting the teacher out could live in a district containing a man who could write such a letter as I had received. The boys had shown me letters from their school officers filled with dreadful writing and mis-spelled words. This pompous letter appeared to indicate a high state of education. I had yet to learn a valuable lesson that Bear Creek did much to crowd into my mind.

My acceptance of the position brought out another eloquent letter from Mr. Forest. He informed me that the school would open on Monday following the closing of our Fall term. Examinations would be finished Friday night, and by taking the night train I could reach Bear Creek on Saturday morning. This would give me time to "qualify myself as required by law" before taking up the reins of authority in Bear Creek. It was necessary for teachers in those days to pass an examination in the various townships in the State. The office of School Inspector being a political one, was frequently held by men totally unfit for the position. Some old schoolmaster, with ideas of 50 years before, which had grown rusty in his inactive brain, was the ideal candidate in many instances. The great delight of such an examiner was to have some smart young college boy appear before him for an examination. All the old questions that had puzzled the brains of teachers for years were brought out to hurl at the head of the hapless college boy.

It was the crowning event of a life with one of these old fellows to "tie up" a college boy with questions that no living person could answer satisfactorily and thus prove the great superiority of the old style system of education over the newer college training. These defenders of the old times were painted in their blackest colors and used as bugbears to frighten freshmen into hard study. Many a poor fellow worked far into the night for weeks in order to prepare himself for the great examination. I was a little frightened myself at the thought of running against an antiquated education in Bear Creek, in spite of the great letter I had received.

It was standing information at the college that we would surely be expected to prove that the earth is round. I have never been able to do that satisfactorily to a person who had fully decided that the earth is flat. I have found many such. We had hard studying at the end of the term. I found a whole room full of freshmen one night hopelessly tangled over the meaning of the words "concrete" and "abstract."

Frank and I talked matters over considerably. I was glad to get his views, for he had had considerable experience. His district, I thought, was sure to fall behind mine in intelligence, for his director spelled school "skool," and the letters ran up and down all over the page, yet in my superiority, I was glad to listen to his experience.

"The teacher's side of district school teaching," said Frank, "is about like this. His first business is to get his money. That is what he does his work for. He has no idea of following the work up for a living, and he simply does it because he can make ready money at it. He would like well enough to have his pupils make good men and women, but he knows that whatever good he may do them in four months may be entirely overcome in the following term. His great object is to make things pleasant for all hands and keep his place.

Suppose, for example, I have some great brute of a boy come to school—very likely the son of one of the school officers. I'm a small man and I would have no chance with him in a fight if he wanted to be unruly. If he whips me and puts me out of school I lose my money and all chance of coming back here next year. What am I to do—fight him and ruin my chances or humor him and thus get through the term? In my present condition, I'll make sure of the money first, and then start out to reform the world."

"But a teacher ought to have higher aspirations" I suggested secure in the thought of my literary friend the director and his probable influence in Bear Creek. "Of course he had, but he won't find it in most of our district schools, as you will soon find out. If you don't come back here in the Spring with your "high aspirations" toned down, I'll give you my pie for a month.

About the only species of gambling our finances would permit us to indulge in, consisting in wagering the dessert which was served in the college dining hall. Each day we were served with a piece of pie, a dish of sauce and a slice of cake. Those were wagered on every base ball game or other exciting event. I remember once, how, after an exciting game of base ball, the entire junior class went without pie for a month.

Examinations were over at last, and after an hour spent at singing college songs we shook hands and scattered for our winter's work.

(*To be continued.*)

LETTERS FROM THE COUSINS.

Dear Uncle Mark: I did wish to try and get the plow; but I was afraid that some one of the Cousins could spell out more words than I could and I would fail, so I did not try. I do not think that I shall ever try to escort one of the Cousins home from spelling school, for fear she'd refuse, and that I could not endure. I hope the Cousins will all write to Uncle Mark, and write the best letters they can, and help to clear our page of those long advertisements. It seems too bad that we cannot have one page for so large a club of young farmers who are doing so much to help carry on a great many farms and to make the Rural interesting every week. Let us write about how Father manages his farm, and tell us what you think about his way. I wish to know more about the Cousins—what they do and how they do it. I have a bed of onions, carrots, beets, Swiss chard and a lot of peas, and I sell them for 50 cents a peck in the pod. Besides, I have several kinds of potatoes that must grow very large, as they must show themselves at the County Fair next Autumn. I have some early sweet corn, the earliest grown. You must all get some seed and raise a good lot next year; it is the Cory Corn, and the very best. Now, write to Uncle Mark such good letters that he will keep that page clean for us. Your nephew on the farm.

Osage, Iowa. LEWIS SMITH.

[That's right. I want to drive all the advertisements off the page. Write again, Lewis.—U. M.]

Dear Uncle Mark: I thought it about time to write another letter to the Rural. We think the Alaska Peas are all that is claimed for them. The Garden Treasures did not do well. The corn is looking well. We have a good Sulky Plow, so I thought I would not run opposition to the rest of the Cousins. My Sister Olive thinks Uncle Mark answered her question (is there any Aunt Mark?) when he wished there was an Aunt Mark to help count. A golden robin saved an apple tree for us from caterpillars. It killed them all.

Your nephew, MONT. VAN FLEET.

[That bird is worth its weight in gold, surely.—U. M.]

Dear Uncle Mark: Once upon a time, (that's the way to begin, isn't it?) many years ago, I belonged to the Y. H. C., but it has been so long ago I am afraid I am forgotten. We have a large fruit farm here, principally of pears, though we have nearly every kind of fruit. Now, I know Uncle Mark is not partial to the LeConte pear, but we think them the great pear for the South. This place is only 14 miles from Galveston and on a railroad, which makes it a desirable Summer retreat. Our home is beautifully laid off with walks, trees, flowers, fountains and fish-ponds. During the Summer girls and boys from Galveston come up to enjoy a breath of fresh air and roll down the hay-stacks. One young lady who was visiting us, tumbled down and nearly broke her neck. I don't think she will try it soon again. Right behind our place is a beautiful bayou, with the trees hanging over the water and covered with long waving moss. The banks of this tropical stream are covered with palmetto fan palms, ferns, etc. Everyone has boats and bath houses: I have a beautiful yacht and skiff. So, Uncle Mark, I think I am justified in inviting you and all the cousins to come and have a picnic.

Your Nephew,
"TEXAS BOY."

Hitchcock Station, Texas.

[Wouldn't we like to come? We would not roll off the hay stack either.—U. M.]

Dear Uncle Mark: The Cousins' letters are very interesting. I thought I would write. I live in central New York. It is very pleasant, only a mile from Skeneateles Lake. There is a water cure and new hotel at the head, and a village at the foot. It is very pleasant to go around the lake on the large steamer. I put the melon seeds in cake boxes; they were about three inches high, the middle of May. We have a peach orchard containing 200 trees. I have some peach trees; they had some peaches last year that were very good. I raised them from the Stump the World pit. I have one grape vine, I drove in some posts and nailed on some boards and tied it up.

Mandana, New York. EVA BOWKER.

Dear Uncle Mark: As you made me a member of the Y. H. C., I will try my best to make the club as bright as possible. Thanks for the sweet peas you sent me. I gave them to my sister Fern to try her luck with them. She may write this Summer to tell how they are coming along. She wants to be a member of the Y. H. C. The freeze of January 7th, when the thermometer showed from four to six degrees below zero, killed the tender roses and fruit buds, but the later freeze, with mercury at 25 degrees above zero, killed most of the fruit buds that were remaining. When I entered school this Winter, for the first time, I entered the third grade, and I am now in the sixth grade. I will write again this Fall and send a report of my vegetable garden. I wonder how many of the cousins can write phonography or short-hand. I can write some—I am learning. Your nephew,

WILLIE B. MUNSON.

Dennison, Texas.

[You made pretty good work in school. I wish more of the cousins could write short-hand. It is a valuable art, and will be very useful to our coming farmers.]—U. M.

Dear Uncle Mark: I have not written for a long time, but I have been so busy going to school and helping in the house, and making my flower bed, that I have hardly had time to write before. I received the sweet peas, and thank you for them, but I did not get them planted very early: so they are only one or two inches high. My sister is 14 years old and I am 11, and we intend to keep house ourselves this Summer, for our house keeper is going home, and our Mamma died a year ago last March. My little brother Frank has not missed one day nor been tardy this Summer, his first term of school. Your Niece,

Rockland, Pa. KATIE JACK.

[I think you will make very nice little housekeepers. We all want to know how you succeed.—U. M.]

Dear Uncle Mark: I would like to join the Y. H. C., if you will let me. I live in the Judith Basin, M. T., about 170 miles from the Capital. Papa received the seed you so kindly sent him. The Alaska peas are in bloom and look very nicely. I see by the Rural, May 29, it will soon be time to fight potato bugs. I think I can tell you a better way to kill them than knocking them into pans. Run a furrow with a shovel plow by the side of the potatoes. Take a bunch of weeds and knock the bugs into it. As the bugs try to crawl out (the earth, which will be damp) will roll from under them and the hot sun will soon kill them. There will be a few to get back, but this must be done two or three times on hot sun-shiny days. We have 35 head of cattle, two horses, six pigs, and three pet lambs. We planted part of the Garden Treasures, but they never came up to do any good. We have two plants about five inches high, dark-green leaves, and are very thorny; can anyone tell me what they are? I have a new kind of peas; they are a cross between the marrowfat field pea and a garden pea I do not know the name of; they look like the Prince of Wales—only they are about a week earlier, but the new kind has a vine like the Prince of Wales, a flat light-green pod, and large flat smooth peas. If Uncle Mark would like to try some of them, I will send them this Fall when they get ripe, if the frost or bugs or something else do not take them. They are growing nicely now. We have about 30 seedling gooseberries, and one seedling strawberry.

Your Niece FLORA MONTGOMERY.

Philbrook, Montana.

[I will gladly plant the peas. I think it will be handier to poison the bugs.—U. M.]

Dear Uncle Mark: I'm a little girl nine years old, and I would like to be one of the Cousins. I live on a farm and Pa keeps a dairy. We keep 22 cows. We raise a great many chickens. We have three colts and two old horses. We have three little kittens just big enough to play. The woods are right in front of our house, and I can go in them any time I want to, and I can have lots of fun. I like to read the letters very much. We have a big dog named Jack. My sister would like to know whether you are a young or an old man. She would like to have you come out here so she could look at you.

FLORENCE CAMPBELL.

Dansville, New York.

[What do you think about it—am I old or young? A great many people don't like to tell their age. I guess I am both old and young. I have an idea that people would be disappointed somewhat in looking at me, so I had better keep out of sight.—U. M.]

Miscellaneous Advertising.

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

PERSONALS.

SECRETARY BAYARD, one of the best horsemen at the capital, rides frequently on one of the finest Kentucky Thoroughbreds

THE wife of Senator Cockrill, of Missouri, is credited with "having brought her husband out." She was a Miss Young, of Ohio, and is a relative of the Sherman family.

EX-CONFEDERATE GENERAL BUCKNER has a farm a 1,500 acres, 600 cultivated, in a quiet part of Kentucky. He lives there most of the time, on the spot that was his birthplace.

TAYLOR will probably be the name of the next Governor of Tennessee. The Republicans have nominated Alfred Taylor and the Democrats will put up his brother, Robert Taylor, if the latter consents to run.

A BLUE GRASS statesman—a widower, by the way—said bluffly: "What do I think of Mrs. Cleveland? Well, now, maybe you remember what somebody says to somebody else in the 'Colleen Bawn:' 'When you die leave your money to the poor, but leave your widow to me.' So say I to Grover."

EX-PRESIDENT ARTHUR is improving at his summer residence, where he does a little strolling about, a little fishing and a great deal of resting. He is terribly emaciated and without physical strength, and his prolonged illness has made him, who was always noted for his good nature and urbanity, a good deal irritable and brusk.

JUSTICE GRAY, of the U. S. Supreme Court, is said to be fitting up his fine new house at Washington for the reception of Mrs. Gray, now Miss Annie Van Vechten, who is at present in Europe. Justice Gray is 58 and Miss Van Vechten about 35 and very beautiful and accomplished. His particular attentions to her during her last visit to the White House were the subject of much comment at the time.

CLAUS SPRECKELS, sugar monopolist of the Pacific Coast and real King of the Sandwich Islands, denies the report that the nomiual King wants to sell the islands to that European syndicate for $10,000,000. Doubtless the real King, owning the best part of the land, thinks he can make more out of the place than by selling it for a paltry $10,000,000.

THE late David Davis, though his wealth was rated in the millions, continued to observe the frugal manners of his early days, even after being appointed a Justice of the Supreme Court and elected Senator. Punctually at one o'clock every day, when in Washington, he made his way to the stand kept for many years by a woman called "Dyspepsia Mary," and there ate his lunch, which consisted of two apples, a ginger cookie and a glass of milk, costing him 15 cents in all.

IT was Senator Van Wyck, of Nebraska, who secured the adoption of an amendment to the Northern Pacific Land-Grant Forfeiture Bill, which will make the land upon which stand the road, its stations, elevators, tanks, machine shops, etc., taxable the same as other real estate. The land-grant Senators had cunningly framed the bill so that these would escape taxation in the Territories; but "Old Van" was too smart for them. Doubtless the roads will try, for revenge, to defeat his re-election; but they'll find it a harder job to undo some of the legislation he has got through during his present term.

THE Grand Old Man is thus described as he looked the other night in the House of Commons; remember he is 78: "His mouth is drawn down and in, until the lips seem a thin, irregular, uncertain line; the face is broad, noble, all but majestic in its firm lines of vigorous old age; the scanty fringe of scattered gray around chin and cheeks meets the sparse silver locks upon his bald, great head. It is a great head physically, massive, square, broad, angled sharply at the cheek bones and ears—a head which would be chosen by a painter for a statesman's model, but not for that of an actor, artisan or merchant."

"ONE of the sensations of the Washington season has been the adoption of armorial bearings by Secretary Manning and Gen. Logan," says a Boston paper. The adoption of a "coat of arms" to which the adopter hasn't an ancestral right is forbidden in aristocratic Europe; but in this free democratic Republic, any man, woman or child can appropriate the heraldic device of Emperor, King, Prince, Duke, Marquiss, Earl, Viscount, Baron, or "Commoner," or make one to suit his or her own fancy, and paint it all over the house, print it on note paper, embroider it on handkerchiefs, engrave it on rings and watches, or even tattoo it all over the body. Shoddy plutocrats Bobbs and Snooks are assuming "armorial bearings" every week without creating much sensation, why shouldn't Manning and Logan follow so high-toned an example?

Entered at the Post-office at New York City, N. Y. as second-class mail matter.

Humorous.

"Has my client any right?" asked a counsellor, out of patience, of a brother-wrangler at the bar. "I know not," was the response; "but one thing is certain—when you get through with him he'll have nothing left."

"Yes," said a husband sadly, "my wife is a devotee of the red flag. The very sight of one arouses her to the highest pitch of excitement." "Surely she cannot have any sympathy in common with such cut-throats?" "Yes she has." "What, Anarchists and Socialists?" "No, auctioneers."—*New York Sun.*

"No, sir," remarked the irate customer, banging the bottle down on the drug store show case; "I don't want any more of Pott's Liver Cure." "It's a very good remedy, sir," suggested the clerk, timidly. "Yes; maybe it is for Pott's Liver. Probably it is. But it wasn't worth a cent for mine."—*N. H. Patriot.*

"Oh, did I tell you about little Henry, Grandma? He's got a bicycle!" "Land alive! Well, don't get excited about it. Jest you put a big poultice of soap and sugar on it, and change it every morning, an' it'll be gone in three days. Your Grandfather used to have 'em, every hayin' time, reg'lar as June. They ain't nothin'; they'll do him good."

At a large and a would-be fashionable wedding recently held in a town in this State the solemnity was rudely disturbed by a rather unexpected answer. The bride had entered on her uncle's arm and was met by the groom at the chancel. The uncle then returned and took a seat in the body of the house. All went well until the clergyman asked the question: "Who giveth this woman to be wedded to this man?" He paused for an answer, and the uncle rose, and placing his hands on the pew in front of him, said, in accents louder than are common at weddings, "Me."

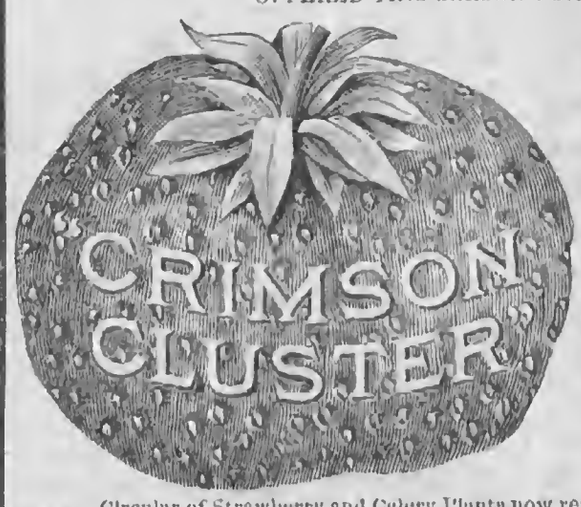
NEW SEEDLING STRAWBERRY, **"Crimson Cluster."**

OFFERED THIS SEASON FOR THE FIRST TIME.



On the 10th of June of this year, we examined this Strawberry on the grounds of Mr. E. W. Durand, and found 3,000 plants that had been planted on the 15th of August, 1885, which in less than 10 months from the date of planting, were producing a crop that would average fully a quart to each plant; 3,000 quarts from the 3,000 plants, or at the rate of over 20,000 quarts per acre. The crop was so immense and the size of the berries so large, that the pickers, who were paid 2 cts. per qt., averaged 25 qts. per hour, or $5.00 per day—a fact beyond question, and which a dozen affidavits could be had to attest. When to this extraordinary production we add the further facts that this strawberry is of the richest crimson color, borne in immense clusters, and that it is one of the LATEST as well as the EARLIEST, as its great vigor prolongs its season of fruiting, added to its excellent quality, there is every reason to think that it is bound to be the most valuable strawberry ever raised by Mr. Durand.

Prices, in pot-grown plants, (ready July 15th), 12 for $2.50; 50 for $7.00; 100 for $12.00. By mail at dozen rates.

Circular of Strawberry and Celery Plants now ready and mailed free on application

NEW STRAWBERRIES.

THE HILTON. Plants of this were received from H. H. Alley, Hilton, N. J., in August of last year. (Shown at Fig. 280.) We have in this a remarkable berry — remarkable as to size of berry, and vigor and health of the plants. The flower is pistillate or nearly so. The plants here are fully as vigorous as Sharpless, the leaves quite as large. The habit of the plant is, in fact, like that of Sharpless. Mr. Alley raised it five years ago from, as he says, Great American, Sharpless and Champion; but we doubt not Sharpless is the father. He claims that it is very prolific, that the quality is good, and that it "can be grown with less fertilizing than any other large berry." As to the last statement, we have nothing to say. Our plants grow in an ordinary garden soil, where nearly all strawberries thrive fairly well. It is certainly more prolific than the Sharpless; the berries average as large and of better shape. From one of the plants the largest berry of the season was picked, being 6¼ inches in circumference. Some are ovate in shape, the largest often fan-shaped, sometimes covering the larger part of a semicircle. The peduncles are very large and strong, holding up six or seven berries of large size. Upon one peduncle, June 16, there were 20 berries, all green, six of which were large, one the largest of the season, as above stated, the rest as shown in our engraving, which is quite true to nature.

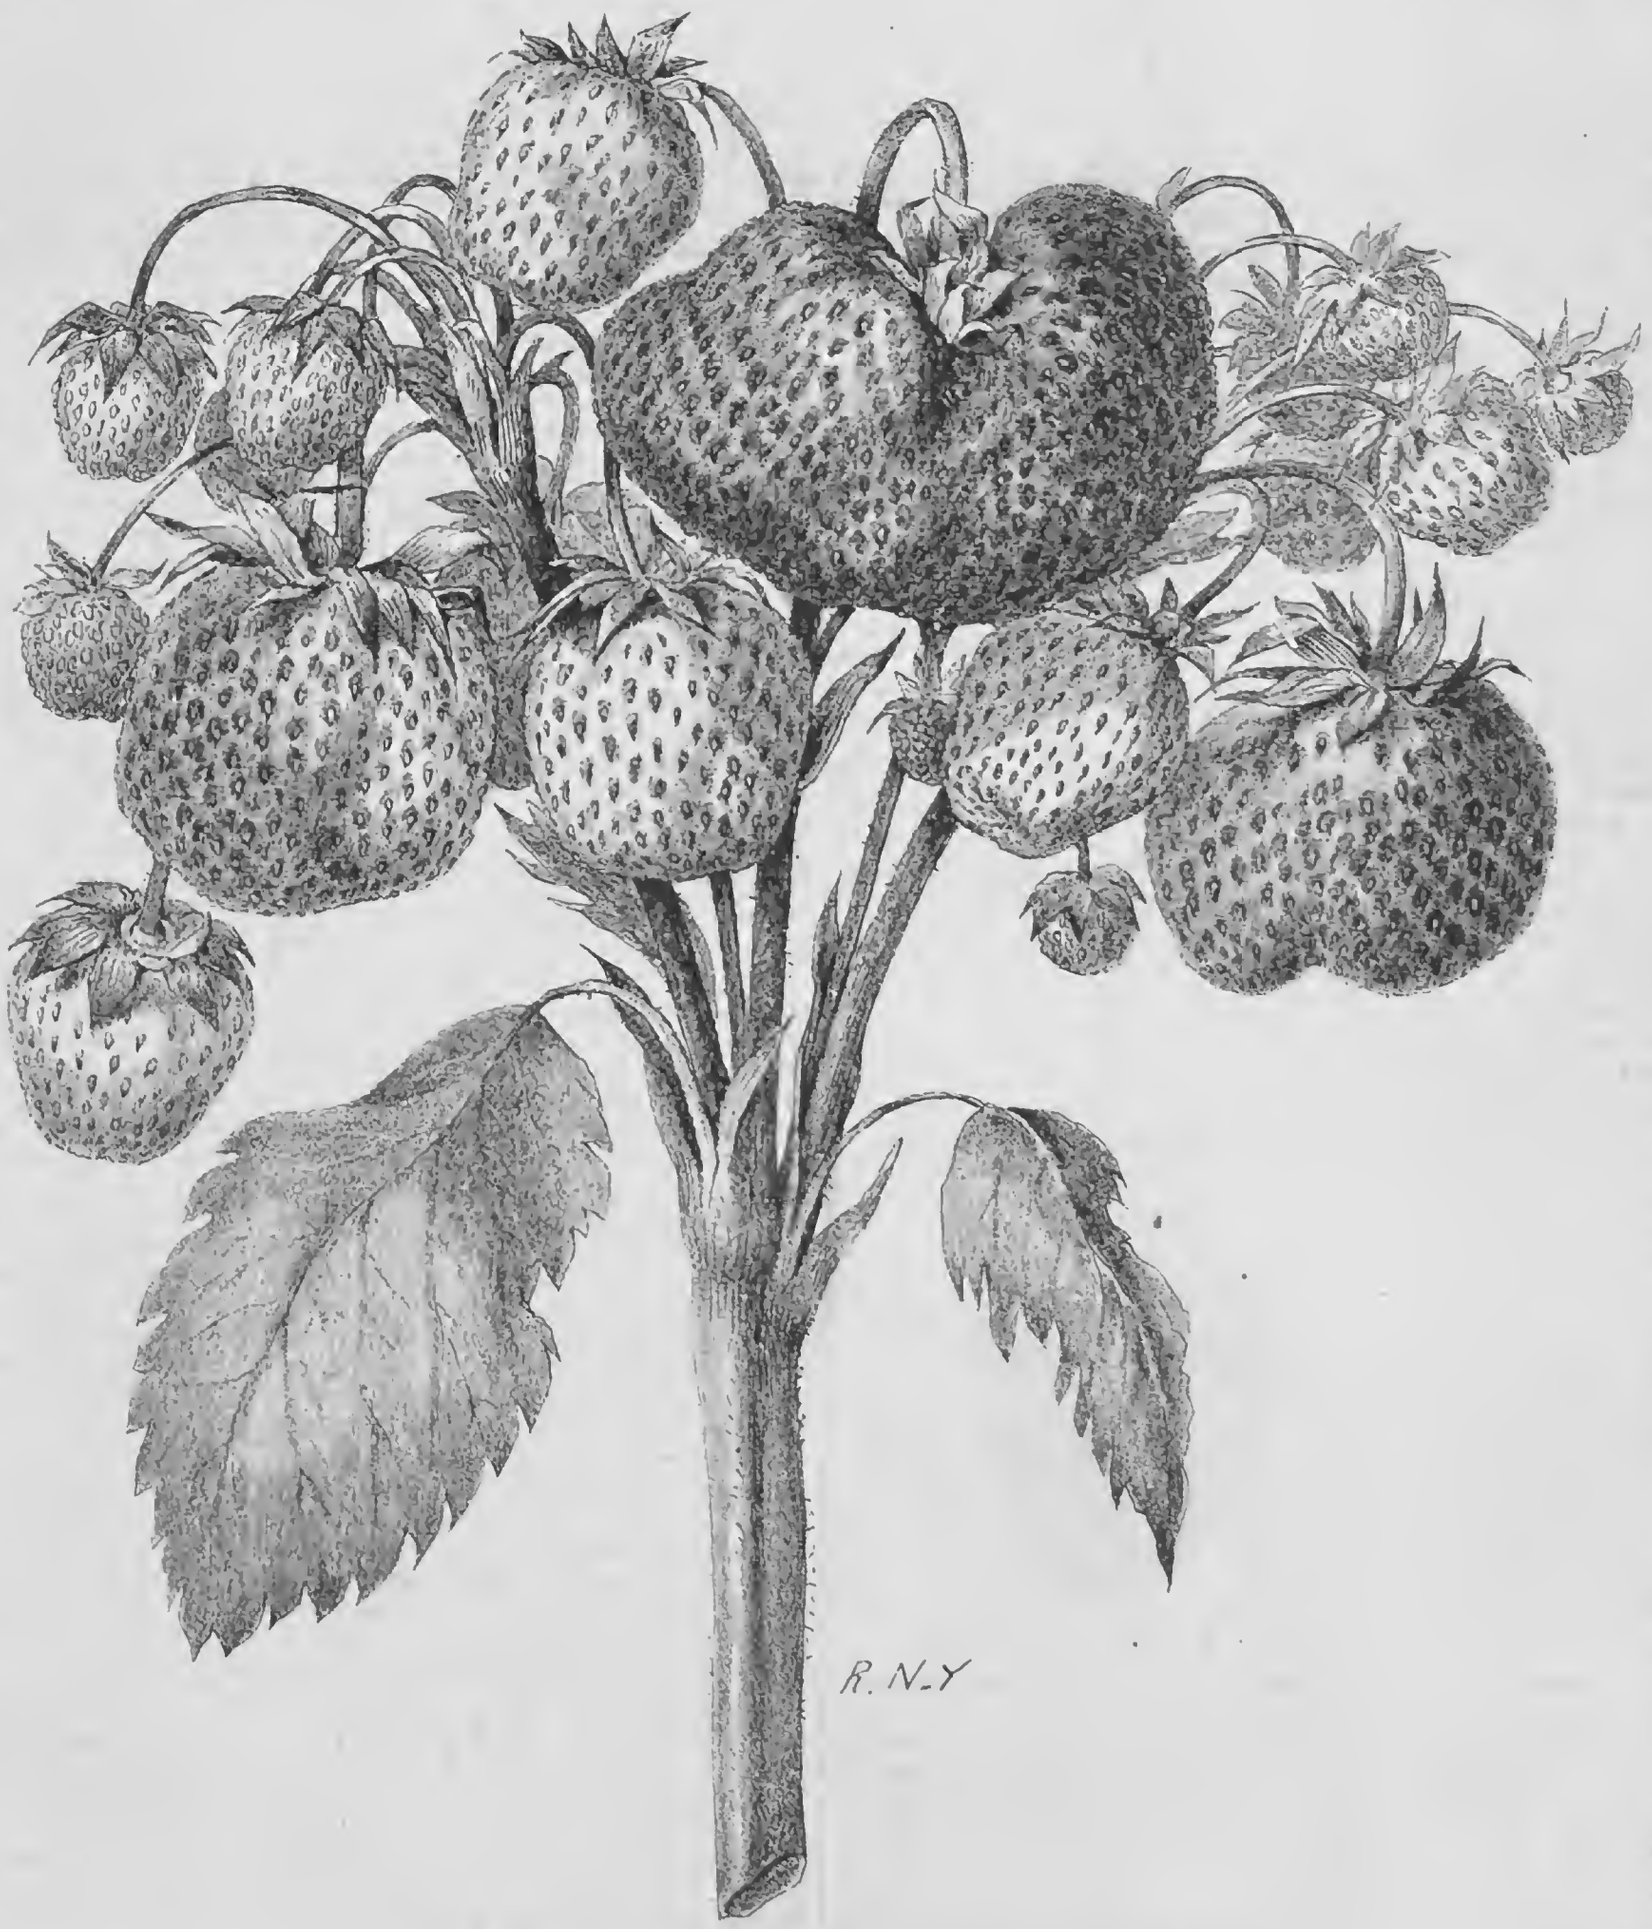
This berry begins to ripen when Sharpless is at its best, this year about June 16. The color is much like that of Sharpless, though not quite so bright. It is fully as firm. The flesh is red throughout; the quality, we regret to say, is not of the best. It is not quite so good as Sharpless. For a market berry of the largest size to follow Sharpless it may prove very valuable.

In these times, when scores of new berries are being offered every year, there seems to be little excuse for introducing those of inferior quality, unless they supply some need which is not supplied by any other variety. Judging by this season's fruitage, the Hilton is by far the largest berry of its season of ripening we have ever tested. The vines, as has been said, are remarkably strong, healthy and productive, and our friends must judge whether these characteristics, possessed all together in a degree rarely seen, will compensate for its one notable deficiency.

LIDA, BOMBA, AND PARKER EARLE.

PARKER EARLE.—Plants of this were sent to us by J. T. Lovett, in April of last year. The first berries were picked June 7. The shape, as shown in our illustration from nature (Fig. 281, page 462), is ovate-conical, and about as nearly perfect as may be. The berries average large, and of good quality. The color is a brilliant glossy crimson, seeds dark, not deeply imbedded. It is firm enough for a near market. Perfect flower. The foliage is variegated with light yellow, though quite strong and healthy. The fruit lasts until Sharpless ripens. We can not see that the Parker Earle, all things considered, is any more desirable than many other new varieties which we are testing this year.

LIDA (pistillate) was received from W. Parry, Parry P. O., N. J., March 20 of this year. It is a seedling of King Cluster (now changed to Early Cluster, and to be introduced this Fall by Mr. Henderson). Judging from these spring-set plants, Lida is a vigorous grower and very productive. The berries are of goodly size, as shown in the illustration from nature (Fig. 282, page 462), and firm enough for a near market. As to quality, some of the earlier ripening berries were rich and good—the later ones were watery and rather soft. The shape is ovate-conical, sometimes ovate; the color, when ripe, dark crimson; the flesh colored through; seeds dark, slightly imbedded.



THE HILTON STRAWBERRY. From Nature. Fig. 280.

BOMBA, also from Mr. Parry, is also a seedling of King Cluster. It is a strong grower apparently. The fruit averages large, dark in color; flesh red and fair in quality. First ripe berry May 31. The shape is generally regular and quite firm; seeds yellowish. It is sometimes Boyden 30-shape and green at tip; sometimes Crescent-shape. As to productiveness and quality, Lida is preferred. (Shown at Fig. 283, page 462.)

Readers will kindly note that we give the above as mere impressions formed from the behaviour of Spring-set plants of the present year.

RASPBERRY NOTES.

At this time, McComber's White Seedling of Antwerp is our best berry. They are so large and juicy that one scarcely knows whether they have seeds or not. Contrary to our expectations, it passed the winter sustaining no more injury than most other kinds. The Marlboro disappoints us greatly. The bushes show a decided lack of vigor, the berries are no larger than those of Turner or even Hansell. We are glad to know that in other places it is highly prized.

We now have the Crimson Beauty from three different parties. They all seem to be the same, and are without any particular merit of any kind except it may be earliness. The berries are of medium size, good quality, often imperfect. Beebe's Golden is a sweet yellow-cap berry, small and seedy.

SPRINGFIELD is a black-cap received from H. S. Anderson, of Union Springs, N. Y., Dec. 1st, 1884. It ripens with Doolittle, or a little before. The berries are black, without bloom, of good quality, but not quite so firm as those of Doolittle. The canes are thornless and hardy.

BELLE is a blackcap, received from L. C. Carlow, of Batavia, Ill., in May of 1885. It is one of the most hardy, vigorous, and productive caps we have ever raised. It is also among the earliest to ripen. The berries, which are borne in clusters of from eight to ten, turn first red on one side, yellow on the other, and then black with some bloom. They average as large as those of Gregg, and are firm, but as grown here are as nearly tasteless as a berry well can be. Mr. Carlow says that the quality is better than Gregg. It may be so with him, and may prove so with others. We must speak of the fruit of plants sent us as we find it, though it is often with great reluctance that, with many good qualities, we are obliged to point out a failing which renders a new variety unworthy of introduction.

Horticultural.

GARDEN NOTES FROM BOSTON.

We look upon Boston as the center of refined gardening, and expect to find there what is new among trees and shrubs, hardy and tender plants, and arrangement in gardening. With this object in view a few of us make an annual pilgrimage to the Old Bay State.

The Railroad Stations.—Entering Boston by way of the B. & A. R. R., we find that the grounds about the several stations for 10 miles out from the city, are laid out, planted and kept up in excellent garden style. There are broad patches of smoothly mown grass, shrubbery clumps, masses of roses, specimen trees and the like; but I did not observe at any of the stations so much as one coleus, one geranium or one verbena; nor did I see any of the abominations so common in gardens, namely, whitewashed stones or imitation flower beds made of various-colored kinds of gravel.

Spring Flowers.—The flower beds in the Public Garden had been planted with pansies, polyanthuses, daisies and forget-me-nots. All of these were pretty enough in their season, but in June they present a too poverty-stricken appearance to warrant their being retained so long.

Shrubbery Masses.—The Public Garden contains a goodly variety of trees and shrubs, some discreetly and others most stupidly arranged. A mass of lilacs is beautiful, so is a mass of rhododendrons, but I never could see beauty in a conglomeration of lilacs, honeysuckles, spiræas, viburnums, tamarix and other shrubs, with some stray phloxes or other perennials scattered along the outer edge. No one plant among them can display itself to its fullest advantage. And this is less excusable when we find the same incongruous grouping repeated again and again in the same garden.

The Crescent Strawberry.—At Mr. Hunnewell's, at Wellesley, the Crescent is the favorite and main crop strawberry. I was surprised at this, as I find the Crescent one of the most acidulous of berries, and without either quality or size to recommend it. But it goes to show that the variety that is first-class at one place is poor enough at another, and *vice versa*. [The Crescent was tried at the R. G. when first introduced. We have never cared to raise it since, on account of its acidity. But it seems to be gaining friends both East and West.—Eds.]

Red Top Grass for Lawns.—At Mr. Hunnewell's many acres of lawns have recently been turned under, graded, leveled and resown to grass. Red Top alone is the grass used. Mr. Harris, the gardener, considers it the best of all lawn grasses, and prefers it clean, without any mixture of other grasses or clover.

Kœmpfer's Irises.—I found at Mr. Hunnewell's and Mrs. Gardiner's large masses of these showy perennials growing in sunken beds that are frequently flooded two or three inches deep. In this way, by treating these irises as aquatics, vigorous growth and exceptionally fine flowers are obtained.

Premium Limas.—Mr. B. G. Smith (Treasurer of the American Pomological Society) is very successful with Lima beans, and for the past ten years has taken first premiums for them at the Massachusetts Hort. Soc. Exhibition. About the middle of April he sows his seed in 6x7 inch square, bottomless boxes, filled with rich earth and set on the floor of a cold grapery. About the end of May he lifts them on a spade and sets them out in his garden; having the holes previously prepared for them, he slips them through the boxes without damaging a root. They never wilt. They come in about a month ahead of those sown in the open garden. He selects the best and earliest beans for seed for the next season.

Schizophragma Hydrangeoides.—At the Botanic Garden, Cambridge, Mass., in 1878, I set out a plant of this in the rockery. It spread about over the stones a good deal, and the other day I found it in bloom. The inflorescence consists of large flat cymes, with a few white sterile flowers towards the margin. It is not showy, but in quantity would be attractive. WILLIAM FALCONER.

IS STRAWBERRY CULTURE FOR MARKET OVERDONE?

Strawberry shipments are over with us for this year, and I think there are few who have been shipping to our large cities, that will deny that the business is over-done. When the best berries that are grown sell for four to six cents per quart, there is nothing in them for the grower, and that is the price many have sold for the past week, while poorer stock went at one to three cents per quart—not sufficient to pay the expenses of shipping in most cases. The prospects are good for a large crop of raspberries and blackberries, and also of the larger fruits (with perhaps the exception of apples) and there is no reason for expecting much better prices on them. In the face of these facts, it is certainly not wise to attempt to induce people to engage in fruit culture. There are those who are interested in the sale of fruit plants, who will tell a long and exciting story about how Mr. "So-and-so" made $500 an acre on fruit, and they publish

Parker Earle. Fig. 281. (See first page.)

these statements year after year. The story no doubt may be true; but it is also true that some men have made a fortune in a little office on Wall Street. The fact that some have done these things, does not prove that everyone can.

Mr. Williams, Secretary of the N. J. Horticultural Society, made some very forcible re-

Lida. Fig. 282. (See first page.)

marks at the meeting of that society last Winter. He said: "If fruit-growing were such a profitable business as some parties pretend it is, would it not seem policy and good judgment on their part to stick to it, instead of urging all creation to enter into competition with them and divide the profits? Does it not look a little as though they looked for

Bomba. Fig. 283. (See first page.)

their profits from other sources than their own fruit-growing?"

I am glad the Rural does not urge the indiscriminate planting of large quantities of fruit for market, but it does urge people in town and country to plant for home use and to supply their home market. Small towns and villages will often take a quantity of fruit and at such prices as will make the supplying of the demand a remunerative business to some near-by grower, while if the fruit is shipped to them from the cities, it often arrives in bad order; and while the consumers pay a good price for it, the grower gets very little, the difference going to pay freight, commission, etc. But many already in the business are so situated that the bulk of their products must find sale in the large markets. What will be the effect of the present low prices of strawberries on these growers? There will be many old fields plowed up—perhaps some more than would have been had the prices been better—but this is always the case, and will only offset what were planted last Spring. The crop next year is likely to be large, if the season should prove favorable. There are many people engaged in the business who are easily discouraged. They say "strawberry-growing does not pay," and they will not plant next Spring. This is about the way matters have run according to my observations; and while there may be some improvement in prices next year, I shall look for still better prices two years hence, and they will then continue good for a number of years.

I only offer this as a word of encouragement to those who are already in the business, and depend upon it largely for a means of existence. And I should advise people who have other business not to change and rush into strawberry-growing with the idea that there are immense profits in it, as they are sure to be disappointed. F. S. N.

AIR FOR PLANTS.

Many soil cultivators are scarcely aware how necessary a circulation of air is about the roots of growing plants. A coating of ice, or an impervious crust proves fatal to growth by shutting off the access of fresh air. Stagnant water has the same effect. Yet we can grow many sorts of plants, even grain, in water without any soil, but the water must be replaced with a fresh supply well filled with fresh air, at least once a week. Plants will grow and extend their roots in the open air itself, provided that it be saturated with moisture and sheltered from parching winds and burning sun. Nurserymen prepare their cuttings of hard-wooded, slow-growing plants by putting them in the damp, still, even-tempera-tured air of a cellar, enveloped in moss or some similar open-textured covering preservative of moderate moisture, yet not liable to mold, and there they gradually callus, and the forming callus is not washed or dissolved by any watering. Cuttings of roses and other things that take more time to move in growth than merely herbaceous plants do, will root readily in Summer set in sandy mold in a flower pot, which is set in another in the manner of a glue-pot, the outer larger pot standing in a vessel of water which rises nearly or quite to the bottom of the inner one. The joint around the top of the pots is luted with a smear of clay, and a pane of glass may be laid on. In a place in full light, but sheltered from wind and direct sunshine, no further attention is requisite, unless to keep water in the pan. In two or three weeks the plants will be rooted and fit to set out. Wood that is getting hard, as just after flowering, is best for such cuttings. No watering being necessary, the young growth cannot be harmed by it. W.

THE DEWEY STRAWBERRY.

The Rural, in its issue of June 26, says the Dewey is the most productive of any of the 66 varieties planted on the Rural Experiment Grounds, and promises to have more to say about it. I do not know what the Rural will say in addition to this, yet I think it has supplied the only link missing to make the Dewey much sought after by those wishing a first-class strawberry. The Dewey is the best in quality of any of Mr. P. M. Augur's numerous seedlings. It more nearly approaches the Prince of Berries as to quality than any other berry I know off. We have too few really first-class strawberries to sacrifice any. I think the foliage of the Dewey on my grounds is too vigorous and thick to allow of the variety doing its best as to fruit. I shall keep the soil more loose, thereby retarding the growth of foliage, and see if next year I cannot have the same story to report as the Rural did this. J. T. ROGERS.

[We said it was the most productive *of that date*. Further notes with an illustration will appear in a short time. Its *shape* is a trifle against it.—Eds.]

Farm Topics.

CORRESPONDENTS' VIEWS.

Potato plants can be successfully transplanted. This Spring, at hoeing time, I found that the crows had sadly thinned my potato field. By taking one or two plants from hills that had enough and to spare, I secured an even stand. This pays better than replanting. E. C. B.

Windham Co., Vt.

"General purpose cow!" The expression is a nonsensical one. Every "Jack-of-all trades" is more of a nuisance than a convenience. Milk and beef qualities are as far apart as trotting and draft qualities are in the horse. Old Patchen did his trotting about as a dray horse pulls a load, by main strength, but I never knew of another like him. I never knew a typical Short-horn to make a good milker, and I never saw a milking Short-horn that would lay on flesh. The farmer does not want one of these "general purpose" cows at all. To care for either a milk dairy or a herd of fat cattle is all one man wants to do. I am a dairy farmer. Now and then I have to sell an old cow or a cripple for beef, but I never calculate upon it. I claim that my milch cows do so well that when their milking days are over I can afford to give them a decent burial and still be ahead. This keeping a cow for eight or 10 years and then being obliged to sell her for beef, in order to come out whole, looks to me like very poor business. We don't need any "general purpose" cows; aim at the bull's eye, and not at the whole target. Decide upon what you want—beef, milk or butter—and then breed for that special purpose. Have a definite purpose and a steady aim. D. P. H.

Auburn, N. Y.

My beginning in the stock business was humble enough. I got a few Plymouth Rock chickens and sold eggs enough to buy two little pigs. Then I got a sow. We saved everything. All the dish water was poured into the swill barrel and grain or mill feed mixed with it. We gave the pigs plenty of green food and crowded them right up to the market. They helped us to buy a young cow and calf. The skim milk went to the pigs and the surplus butter helped out our little treasury. In due time a pair of weaning mare colts could be bought, At two years old they did considerable work, and at three years they were a good, trusty team. It was easy enough to multiply and improve this stock after it was once paid for. It was like a young man's fortune; the first $100 comes the hardest. It has been my motto in breeding stock, if I could not afford to pay for the services of a thoroughbred male, to wait till I could, rather than send to scrub and run in debt. This policy has paid me well. Hundreds of good farmers never get a good start. They don't turn the waste into gain, and they won't look after little things. E. B.

Andrew Co. Mo.

You state that the practice of washing sheep is becoming less popular. No one will be better pleased than the wool-grower when the practice is abandoned, but certain grades of wool cannot be profitably sold unwashed. I sent some unwashed fleeces, that fairly represented my wool, to a Chicago commission dealer. The rest of the clip was washed. The unwashed sold at 22 cents and netted me about 82½ cents per head. The washed sold at home for 30 cents or $1.36 per head, nearly 65 per cent. more than the unwashed. J. D. S.

Whitewater, Wis.

You can't beat the Percheron grade as a farm horse. He is patient, and that is just what is wanted on the farm. Farm work is dull business, and it takes patience to stand it. The Percheron is of good size, has fine muscles, and can stand a good deal of hardship. He is easily reared, cheaply kept, no trouble to break, good at any kind of work and always marketable at the best price. He is the driver's favorite because he never balks, always takes a load with him when he goes, and with half a chance keeps in good condition. As a stallion he is gentle as a dog, a sure foal getter, while his size and color always make him popular. I can raise a good colt almost as cheaply as I can raise a Short-horn steer, and sell the colt for twice as much as the steer will bring. J. L.

Franklin Co., Mo.

Why try to catch a mole in a trap? You can get rid of him in an easier way. Moles are very fond of sweet corn. I found that out to my sorrow. I planted a furrow about 500 feet long to sweet corn, and as soon as the stalks were well out of the ground the moles went at it. They destroyed it all, working from one hill to another in curved runs. Like black-birds, they seemed to be after the sugar that forms in the germinating grain. I caught a mole and put him in a half-bushel measure and found by feeding him that he would eat sweet corn. I prepared a grain of corn with a small quantity of strychnine and put it near him. In 15 minutes from the first nibble he was deader than a dozen door nails. Now I am not troubled long with moles. I take a few grains of sweet corn and soak them for about 24 hours in warm water until they

are about in the condition most desired by the moles. Then with a knife I open the grain at the germ and put in as much strychnine as will lie on the point of the blade. Then close the opening with a slight pinch of thumb and finger. It is better to keep this operation a secret and put the grain away in a tight box where none else can find it. Find the ridge over the mole's road, and, making an opening with your finger or a stick, drop two or three of these "doctored" grains into the road. Press the soil gently together, and repeat the operation at intervals of 12 to 20 feet. There are seldom more than three moles that run the same road, and often there is but one. There will be none after this treatment. When the greedy little rascals eat this prepared feast, they will quickly be changed into fertilizer and left where they will do the most good.

Kingston, N. J. J. P.

FARMERS could help the sheep business by eating more mutton. If they would eat less pork and raise more mutton sheep, they would make more headway than they do trying to get help from Congress. Out here for years sheep were raised for wool alone. Sheep were allowed to die of old age, while the herders ate salt pork brought over the plains from Chicago. Not much economy in that. Wool mutton never can beat pork in the markets, and yet good mutton brings a higher price than any other meat. The sheep industry of this country can be helped by the more general introduction of mutton rams. The farmer may not get so much for his wool, but he will get more for his sheep, and his meat bill will be lessened. S. H. R.

El Paso, Colorado.

GOOD butter is still made on the farm, in spite of all the creamery folks may say. Our butter has won fame for us. People always begin a butter article by saying that everything should be "scrupulously clean." That is too suggestive of soap and no end of scrubbing. I want to keep soap out of butter-making as far as possible. We make butter in a cellar. The floor is just as the diggers left it. The walls are of stone. They get a coating of whitewash at intervals. Hot water is freely used in cleaning, but never soap or sand. It is better to clean frequently with very hot water than to wait till soap is needed. The tin pans are scalded out every day after the skim-milk has been poured out, and then put out in the sun. The wooden pails and tubs are scoured once a week with salt. Our butter is packed in tubs. These tubs are prepared by being filled for 24 hours with sour milk. This removes the taste of the wood. Then they are washed and scalded. This system of cleanliness is simple, but it has been sufficient with us. It is carefully carried out. Neglect of any of the details for a day or two would ruin the business. Our pasture is a field of June Grass with a stream running through it. We have carefully cut and dug the weeds out until there are none in sight. Weeds spoil good butter. The best butter "color" is found in a field of June Grass. Rye sown in early September makes a fine feed, and the butter made from it is excellent. It comes on early in Spring before the grass, and that helps the dairyman. A. E. S.

Clay Co., Kansas.

THE fence problem is a great one. What fence shall we use? The old rail worm fence had much to recommend it, but as timber becomes scarce, heavy fences must go. What makes the best substitute? Board fences get out of repair too easily. Many people who think a good fence adds something to the appearance of a place, do not like wire. Many farmers about here are making slat fences. These give good satisfaction wherever they are tried. They seldom get out of repair, the top rail is never knocked off, and there is poor chance for the snow to drift. Short timber that could not be used in any other way can be utilized in making the fence. Posts are driven into the ground in Spring just as the frost comes out, 10 feet apart. The slats are 2½ inches wide, of any convenient thickness, and four feet four inches long. They are fastened by weaving them into No. 10 wire. The two upper wires are placed some 15 inches from the top of the fence, and the lower wires the same distance from the bottom. The fence is fastened by nailing the slat that comes opposite each post. Experts can put up this fence with astonishing rapidity, and it will be hard to beat. K. A.

Ingham Co., Mich.

I HAD two fields of potatoes, as nearly alike in cultivation as I could get them. The soil was sandy—had been in oats the year before. It was plowed and harrowed. No manure was applied. From my irrigating ditch I let into one patch just enough water to keep the plants in a healthy condition. On the other patch water enough was run to drown the plants if they wanted to die that way. Water was turned off long enough to cultivate about every three weeks. The potatoes that had a light supply of water were just about eaten up with scab, while the others were as smooth, mealy, and fair as one could wish A. L. R.

Boise Co., Idaho.

FOR some years past I have been raising the "Shanghai" or big "English" clover, and I like it well. I pasture till about June 20, after that the clover will grow to a good size for hay and be ready to cut after wheat is harvested and the weather is generally favorable for hay-making. If the entire crop is not used for hay, it will be worth as much as common clover for seed. Plowed under green, it is worth more than common clover. That is my estimate of it. W. M.

Howard Co., Ind.

PICK the Kieffer pear eight or 10 days before ripening and put in a tight box or barrel, and keep in a dark room until ripe. Kept in this way they are quite good. Try this, and change your mind concerning the quality of this pear. My Japan chestnuts, grafted on native stock (pieces of roots,) are out-growing the trees I set at the same time. We get mostly "oleo" for butter here. If something is not done pretty soon, there will be neither "oleo" nor butter used, for one does not need to eat the bogus article many times to make him "swear off" from trying to eat butter in any shape. I don't think one-half the butter is used here now that there was before the era of "oleo," unless one is near enough to get it direct from dairymen. J. M. M.

Clay Co., Fla.

---

not half as badly off as you might be. Poor crops, wet weather and the rest of it are bad enough; but they might be worse. We located here four years ago. Just as we got our vineyards and orchards into good shape the Apaches came down on us, killed a man and turned our beautiful place into a wilderness. We got things growing and down they came worse than before. The Government won't pay for the work of these human wolves. If a mad dog got away from its keeper and caused damage, the keeper would have to pay for it. The Government is supposed to keep these red dogs in check. It ought to pay for their damage.

Maricopa Co., Arizona. S. L.

THE books tell us that the onion is a shallow-rooted plant. I believed them until I investigated the matter for myself. Examining a freshly dug onion, I noticed that the roots went straight down. To satisfy myself I dug around a fine large onion and found that in spite of the books the plant sent its roots down. I dug to the depth of a foot and the roots were still going down, though too fine to follow. G. S. H.

Charleston, S. C.

WHAT strawberry shall we raise? Growers are all at sea as to which variety to pin their faith to. Sharpless is the great favorite here, but it is the worst failure of all on our sandy soil. The small fruit craze is getting serious. Where will it end? Little money in the business, yet many are rushing into it. Somebody will be badly left. Wait till these new plants sell for as much per thousand as they now bring per dozen. This advice is taken from a diploma I have secured from the dear school of experience. E. E.

Beaver Co., Pa.

How about the fruit man who sends fruit to market in a package which he knows is under size? I know men who have had the fact proved to them that their quart boxes hold only a pint and a half. Still they continue to use them. Does it make things right to say that others do the same thing? Do we reform the world by imitating vice, or by standing up for morality? J. L.

BLACK HAMBURGH HEN. Re-engraved from the London Fanciers' Gazette.
Fig. 289. (See p. 464.)

I CAN add a little to the advice recently given about throwing the refuse of our hay mows into the manure pile. By all means, don't do it, but before you burn or bury the refuse, clean the clover and Timothy seed out of it. In this way a farmer can get a good part of his seed free. I use a Bonanza fanning mill that does good work. There is a small size that a boy can turn with ease. G. B.

Ulster Co., N. Y.

MISS TREAT, in her book on "Injurious Insects," advises us to use Paris-green in attempting to destroy the Striped Cucumber Beetle. I thought that was good authority. I applied Paris-green, mixed one part with 10 parts of plaster, sifted over both young squash and melon vines. Result, total destruction of both crops, when too late to replant this season. Miss Treat advises the use of Paris-green one part to five parts of flour, yet my mixture only one-half as strong, destroyed my plants. Very poor advice this, to my mind. People who give such advise should keep it out of print. A. F.

Mastic, L. I.

AT our Grange we are trying to find out why farm laborers are so scarce in California. We pay $25 per month, the year round, which we think is far more than Eastern farmers have to pay. You say they are so many working people in the country that are practically starving. Let them come here and take the place of the Chinese at good wages. We don't want the Chinese here, and we have good reasons for wishing them to go, but we would like white laborers in their places.

Sonoma Co, Cal, C. N.

YOU people talk about hard times. You are

Dairy Husbandry.

HOME-MADE CREAMER.

AMONG the farmers in some parts of the country the old milk-trough and low, wide gallon crocks are being displaced by the more compact, convenient and infinitely superior apparatus shown at Figs. 285, 286. They have not yet adopted the patent creamer, chiefly because of its cost, but this contrivance is a long step toward it. It saves a large portion of the labor now expended over the clumsy crock and milk-trough system, is much cheaper, and requires less than one-half the amount of room. It is simply a barrel cut in two and having a faucet near the bottom to draw off the water, see Fig. 285. It should have a close-fitting, light cover to exclude dirt, vermin, etc. The cans can be made by any tinner. They are seven inches in diameter and sixteen inches long. At the bottom of each are three flanges three-fourths to one inch wide and about one-and-a-half inch long. See Fig. 286. To the bottom of the barrel are fastened seven blocks of wood shaped as shown at A. When the cans are set in the tank they are turned until the flanges slide under these blocks, which hold them securely in position, and down to the bottom, whether they be full of milk or contain only a small quantity. When they are

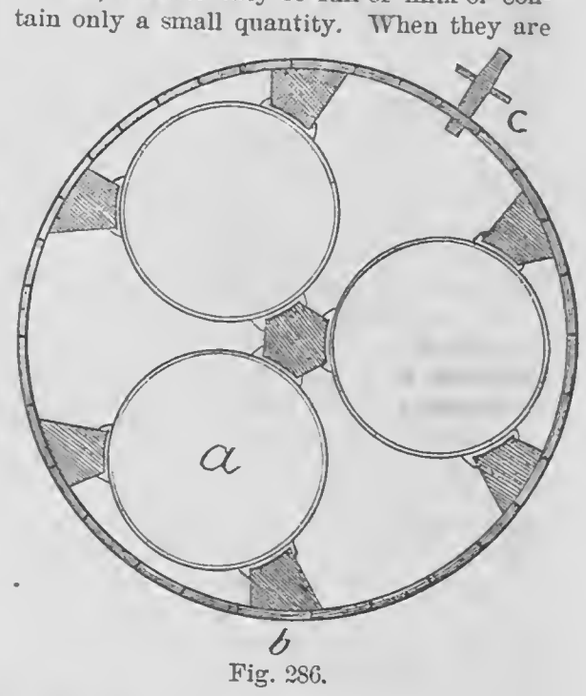

Fig. 286.

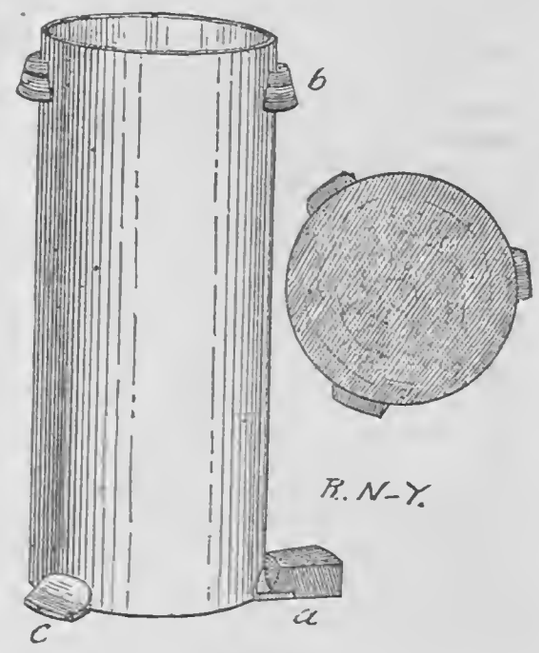

Fig. 285.

to be taken out a slight turn loosens them. Each can should have two strong handles near the top, and may have a cover or not, as desired.

The tank is filled with cold water up to within two inches of the top of the cans, and changed two or three times a day. Some farmers run all the water pumped into the horse-trough through the tank by means of inlet and outlet pumps, or simple spouts. It is a convenient and economical method of changing the water, and should be adopted where possible. This simple apparatus will be found a great convenience to those who cannot afford a patent creamer, and it answers a very good purpose in its stead. The tank should be set inside of some building and kept clean and sweet. FRED. GRUNDY.

Christian Co., Ill.

THE CHANGES OF MILK IN CHURNING.

HENRY STEWART.

THE alimentary value of milk, cream, butter, butter milk, and skimmed-milk is a question of much interest to dairymen and farmers, who should know precisely what benefit is gained from the use of the refuse of the dairy. Milk is a complete food; that is, it contains every necessary alimentary element in the right proportion to sustain life; the protein; the sugar and the fat which make up the carbohydrates; and the mineral matters which are needed to supply the growth of bone and tissue and to sustain the force and heat of the vital functions. It will supply all the necessaries of a young and growing animal, and consequently will maintain a mature one in full health and strength. Moreover, as all its solid substance is contained in solution, it is easily digestible. It is therefore a perfectly nutritious and healthful food. An average sample of good milk consists of 87½ per cent. of water, 3¾ per cent. of fat or butter; 3½ per cent. of caseine or cheesy matter; 4½ per cent. of sugar and one per cent. of mineral matter.

This valuable product seems to have been designed for the use of mankind as well as for a food for calves, for the fat which it contains is in excess of what is needed for the sustenance of a calf, for a calf may be quickly fattened upon new milk, and fat is not at all necessary for a young and growing animal, which requires muscle and bone rather than fat. So that the cream may be taken from the milk and made into butter, and the skimmed milk left may be used for rearing calves quite as well as the new milk, under certain circumstances. Cream consists of from 25 to

40 per cent. of butter or pure fat; 1½ to 2½ per cent. of mineral matter; 40 to 65 per cent. of water, and five to seven per cent. of caseine and sugar. It varies very much in accordance with the manner in which it is separated from the milk and with the quantity of milk which is held among the globules of which it is formed by what is known as molecular attraction. Butter consists usually of 85 per cent. of fat, one-half per cent. of caseine; three-fourths per cent. of sugar, 13 per cent. of water and a small quantity of mineral matter. When pure, cream and butter are both entirely digestible and are exceedingly rich and nutritious food; in fact there is no more nutritious food existing and no other that is perfectly digestible and assimilable.

Necessarily when the cream is taken from milk, the skimmed milk remaining is less nutritious than the whole milk, as it has been deprived of a large portion of its carbohydrates; but it is still an exceedingly valuable food, especially for young animals which are not taking much exercise, and which do not need so large a supply of carbon as animals which expend much heat in the process of respiration which is greatly accelerated by exercise. Skimmed milk contains 90½ per cent. of water, 3½ per cent. of caseine; 4½ per cent. of sugar, and about one per cent. of mineral matter and about one-half per cent. of fat. It is seen to be deficient only in fat, and still contains all the sugar of the milk, which supplies the carbon needed by the young animal to a large extent. When milk is sour a change has taken place. A part of the sugar has been changed to lactic acid, and the acid has precipitated the caseine before held in solution and made it solid. The acid of milk aids digestion somewhat, so that while sour milk is not so digestible as sweet milk, yet digestion of the solid caseine is helped by the acid of the milk. The nutritive value of the sour milk has been lessened somewhat by the change of a part of the sugar into acid, and also by the change of the soluble caseine into solid matter, which is more difficult of digestion.

Buttermilk is considered a better food than skimmed-milk, and probably because it contains 1½ per cent. of fat and the caseine is so thoroughly beaten up that while it is really precipitated and solid, yet the particles are broken up very finely and so much mixed up with the fluid portion, that it is more digestible than the ordinary sour skimmed-milk. The larger portion of lactic acid contained in it also improves its digestibility. Hence fresh buttermilk is often recommended by physicians as a healthful and nutritious food for persons of weak digestion, and if this is true of it, it must also be a good food for calves and pigs. It might also be mentioned that cream is also recommended for the use of persons suffering from lung disorders and weak assimilation, on account of the perfect digestibility of the fat contained in it, but it is for the fat only that it is valued.

The Poultry Yard.

BLACK HAMBURG HEN.

THE picture of a Black Hamburg (Fig. 289, p. 463), is taken from Prof. James Loug's book on poultry. The Blacks are considered the most profitable of all the Hamburgs. The Spangled and Penciled breeds are more beautiful, and are perhaps more highly prized by fanciers, but for practical results the Blacks are undoubtedly most valuable. It seems probable that this breed was produced by crossing with the Spanish. The breed is perfectly well established as a distinct variety, however, and good strains will breed true to color and other points. The plumage is black and glossy. The hens are square and "blocky," with short legs and sprightly carriage. We have tried the Black Hamburgs, as well as most of the other important breeds of fowls. They gave us as many eggs as any we have ever tried. The hens are small, and do not like confinement. Most of the books state that they can be readily confined, but it is evident that they will not do well in small yards. They are essentially non-sitters, and not so valuable for the table as most other breeds. The cocks are proud, fearless, beautiful birds, and devoted to the hens.

Farm Economy.

HOME-MADE RAKE.

MR A. F. MORSE, of Audriau Co., Mo., uses the rake shown at Fig. 287, and calls it the best in use. He says it takes the hay from the swath to the stack or puts it in shock rows much faster and with less horse power, and leaves the windrow cleaner and works no dust into the hay. The teeth are so limber that by means of the heavy point on them on uneven ground they hug the surface and take the hay clean. The rake, he also claims, is the most

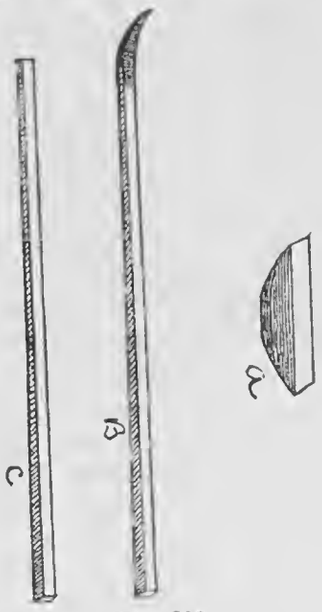

Fig. 288.

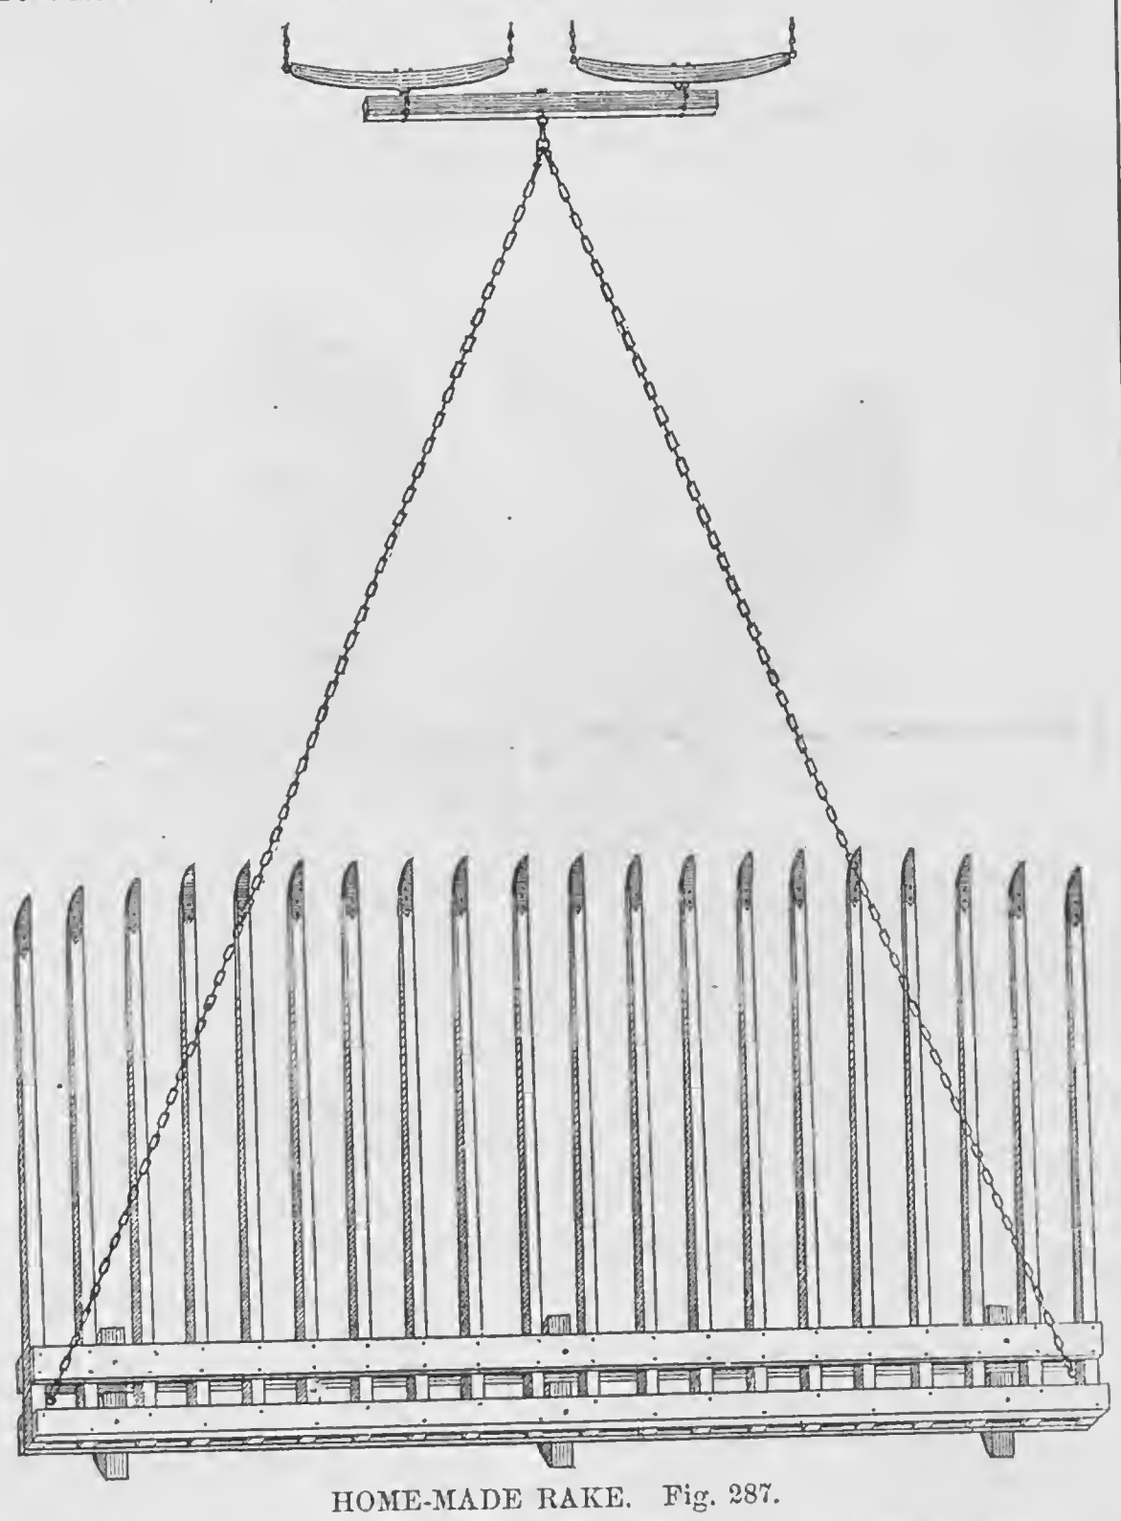
economical in cost and in using. Any farmer with good tools can make one in less than two days. Materials cost from $9 to $11. A boy 14 or 15 years of age can handle one with ease. The rake teeth are eight feet long, made of ash two inches wide, two inches thick at the



HOME-MADE RAKE. Fig. 287.

rear and tapering to one-half inch in thickness at the point. The points, shown at Fig. 288, *b* and *c*, are eight inches long made of band iron and riveted on. The shoes, Fig. 288, *a*, are two feet long and four inches wide, made of hard wood. The rake is 16 feet wide, the top pieces, 1x6 inches, are made of hard wood. The end teeth are 7½ feet long. The chains to which the horses are attached are 20 feet long. In using the rake in pulling hay to a stack in the field, start with horses in rear of rake, and drive to end of the piece to be raked. Swing horses around to the front. As they pass the end of rake, the driver lifts the slack chain so that it passes over the teeth, then drives ahead to the stack. Drive past until one end of rake is against the end of stack, then swing horses away from the stack and drive them around to rear of rake, lifting the chain as before. Then pull rake out from under the hay, and it is left all ready to be pitched on to the stack. In this way an immense amount of hay can be pulled together in the course of a day.

Field Crops.

EXPERIMENTS WITH POTATOES.

I HAVE been following the RURAL experiments with considerable interest—especially those on potatoes, and I propose to give you the results of my experiments on a small scale. I am much disappointed, in examining your rating of potato fertilizers, to find that your list does not include one that has given me very good results, viz. the refuse of glue factories known as hair manure. On the 3rd of April I planted a half bushel each of the Vanguard and Pearl of Savoy and two bushels of the Mayflower, adopting the flat surface culture and mulch system recommended by the RURAL About half of the patch was fertilized in the trenches with hair manure, and the other half with wood ashes, the ground having received last Fall a good dressing of stable manure which was plowed under in the Spring as soon as the frost left the soil. It occurred to me that the hair manure might be used to serve both purposes of fertilizer and mulch, and one trench was therefore treated in this manner, the potatoes being covered in without any fertilizer and a coat of hair manure spread over the top. In using hair manure as a mulch in this way, the application should not be made until the shoots have fairly broken the ground, as if it once receives a wetting it cements into a mat which it is almost impossible for the plants to penetrate. Not being as familiar with the nature of the material as I should have been, I did not observe this caution in my practice, and was somewhat chargrined when I saw the plants all shoot out on one side of this cover—the westerly side. Why they should have all struck for this side I cannot say, but such is the fact. [I should think this hair manure would make an excellent material for mulching strawberries and I propose to try it in this way next Winter.] I dug my first potatoes—the Pearl of Savoy, on—June 11th, and the result, as far as this variety is concerned exceeds in size and product my experience last season with the Beauty of Hebron. The potatoes averaged at that time in size as large as hens' eggs, and from a dozen to 15 to each vine. They were remarkably uniform in size and very few small ones among them. The Vanguard is about as early as the Pearl of Savoy, but not nearly as productive. The result as to yield I will give you later. I would say now, however, that there is a marked contrast in the vigor and color of the plants; those on which the hair manure was used being much more robust and of a healthier green in color.

Mercer Co., N. J. WM. HEWITT.

AGAINST ORCHARD GRASS.

I BELIEVE that nine-tenths of those who grow Orchard Grass grow it at a loss, if they could grow Timothy on the same soil. It is a gross feeder and needs a full meal every year. It makes neither a close sod nor first-class hay. Neither horses nor cattle are fond of it. It must be cut before the spring rains are over, and almost always gets caught in one of them. The second crop is always light. If grown with Red Clover it ripens before the clover is fit to cut. The seed is expensive and a good stand requires thick seeding. At the age of two years tussocks begin to form, with bare spots between on which no other grass can grow. It seems pleased to let weeds of all kinds grow with it and share the manure you have given it. It has some good points, I admit. As a farm lawn grass it is early to start in Spring, and a few days after being cut presents a green surface. After the second crop is cut it will keep green until very hard freezing weather. Sow Orchard Grass for looks rather than for profit. Horses and cattle will eat wheat straw on the same terms they eat Orchard Grass, viz.: if you give them nothing else. Tables of analysis give it a high rank, but it is about like the ammonia that chemists find in "leather scraps." They must have keener instincts than plants, for the latter never find it. Animals search hard and long for the nutriment in Orchard Grass but they seldom find it. I would advise farmers to try Orchard Grass in a very gentle manner. Put in an acre and keep account of its value, and at the end of four years see what it comes to. Dear experience prompts me to say this. I have had 30 acres of the grass. I have now got it all plowed under but one acre. That is now cut and mostly cured and the rain has been falling on it all day. This leads me to speak of another good quality possessed by this grass. It will induce a rainfall every time. If you want rain cut your Orchard Grass and get it nearly cured. You will then have all the rain you want. I never knew it to fail but once.

Catonsville, Md. A. L. C.

What Others Say.

FODDER MATERIALS.—Prof. Goessman, in a late bulletin, says that the peculiar character of our home-raised fodder articles is apt to conceal their special deficiency for the various purposes they are used for in general farm management. They all contain the three essential food constituents, yet in widely varying proportions, and they ought, therefore, be supplemented in different directions to secure their full economical value. To resort to more or less of the same fodder article to meet the special wants, may meet the case as far as an *efficient* support of the animal is concerned, yet it can only in exceptional cases be considered good economy. To satisfy the craving of the stomach and to feed a nutritious food, are both requirements of a healthy animal diet, which, each in its own way, may be complied with. The commercial fodder substances, as oil cakes, meal refuse, brans, and our steadily increasing supply of refuse material from breweries, starch works, glucose factories, etc., are admirably fitted to supplement our farm resources for stock-feeding; they can serve in regard to animal growth, and support in a similar way as the commercial fertilizer in the growth of farm crops, by supplementing our home manurial resources. To feed an excess of fodder materials, as roots, potatoes, etc., which contain a large proportion of *non-nitrogenous* substances, as starch, sugar, digestible cellular substance, etc., means direct waste, for they are ejected by the animal and do not even materially benefit the manure heap. In case of an excessive consumption of *nitrogenous* constituents, a part of the expense is saved in an increased value of the manure, yet scarcely enough to recommend that practice beyond merely exceptional cases. The aim, therefore, of an economical stock-feeding must be to compound our various fodder materials in such a manner that the largest quantity of each of the three groups of fodder substances which the animal is capable of assimilating, should be contained in its daily diet to meet the purpose for which it is kept. To compound the fodder rations of our farm stock with reference to the special wants of each class of them, is an essential requirement for a satisfactory performance of their functions; to supply these wants in an economical way controls the financial success of the industry. From these and similar considerations it will be apparent that the development of a more rational, and thus more economical, system of feeding farm live stock, requires the following kind of information:—1st. How much of each of the essential groups of food-constituents is contained in the fodder we feed? 2nd. How much of each of the essential food-constituents is digestible under existing circumstances, and thus directly available to the particular animal on trial? 3rd. How much of each of the three essential

food-constituents does each kind of animal require to secure the best results?

POULTRY MANURE.—Henry Stewart says, in the N. Y. Times, that every farmer values the manure from the poultry house for its use on corn, cabbages, and other field and garden crops. He knows how it is immediately taken up by these crops, changing the pale color to a deep green, and starting a luxuriant growth. It is one of the problems of the art of fertilizing that certain manures exert an effect quite disproportionate to their supposed fertilizing value. Thus, in 100 pounds of poultry manure there are two pounds of phosphoric acid, one pound of potash, and 2¼ pounds of nitrogen; in 100 pounds of fresh wood ashes there are six pounds of potash and three pounds of phosphoric acid; in 100 pounds of plaster there are 75 to 90 pounds of sulphate of lime in all, five pounds of phosphoric acid, 2¼ pounds of nitrogen, seven pounds of potash, 40 pounds of sulphuric acid, and 45 pounds of lime. Quite a poor and cheap fertilizer would be as rich as this, but the effect of this home-made mixture is often superior to that of a high-grade, costly fertilizer. The reason is not hard to find. It is that these substances are soluble and in an active condition, and furnish the crops with plant food suitable to their needs and readily available. This is a most important point that should be well understood, for it lies at the very bottom of the art and practice of manuring.

WELL-DESERVING OF THEIR FELLOW-MEN.—Peter M. Gideon describes, in an interesting letter to the Western Rural, his efforts during 30 years in Minnesota—after a previous 30 years of nursery and orchard experience—in the work of developing fruits of satisfactory quality, capable of enduring the blizzards and the cold of that arctic climate. Only two trees remain of all his first large planting. These were grown from Siberian Crab seed, and proved a godsend. Now there are many sorts with enough of the Siberian Crab in their composition to render them iron-clads as to hardiness, yet in quality of fruit "a match for the world, whether to eat from the hand or to make into sauce," and the State is likely to become famous for its yield of good apples. Long keepers are as yet scarce. The known long keepers from further south continue their growth too late there and perish. To enable them to produce blossoms there, to be fertilized with pollen from iron-clad sorts, Mr. G. sets grafts on the tops of trees which stop their sap-flow early, and in that way fruit and crossed seed have been produced, and entire success is in full prospect. These labors merit a monument. The orchards of the State will form one better than of marble.

Another of these faithful, silent workers in the horticultural field whose labors benefit all, is Dr. J. Stayman, of Leavenworth, Kansas. He has collected the vast number of more than 3,000 varieties of fruits, and has made, from the fruit in his own hands, cuts and minute descriptions of 2,146 different sorts. Few can appreciate the immensity of such a work, or the cost in time and money of making such a collection, or its value for horticultural reference when faithfully made. Besides these indoor labors, Dr. S. has originated new sorts of value by crossing and otherwise, and is still largely engaged in cultivating seedlings of crosses on up to the development of their fruit. Mr. Gideon's estimate as to the yield of such seedlings is that it takes from 300 to 500 in his line of effort to produce one first-class apple. Often the proportion is much larger.

THE USE OF SALT IN FOOD.—Dr. T. H. Hoskins, in referring to several of what he calls "cranky notions," in a late issue of the Vermont Watchman, says: "Still another piece of crankery is the prohibition of salt, which some ill-informed person, on the authority of an unnamed individual whom he (or she) calls 'a justly celebrated medical writer,' advocates in the RURAL NEW-YORKER. The editor replies to the correspondent with great good sense, saying: 'Whatever may be the conviction of an individual physician, however eminent, it is the nearly unanimous opinion of the medical profession that salt is a necessary stimulus in health.' This is entirely correct, but it is not one-half the truth. The 'justly celebrated medical writer,' quoted by the RURAL'S correspondent, exhibits his utter ignorance of physiological science in saying that 'salt never in any measure promotes digestion, nor any of the assimilating functions of the system;' and that it 'goes the rounds of the general circulation as an unassimilated mineral substance.' The simple facts, as agreed upon by the best authorities, are that salt is essential to digestion and assimilation, and that these processes must stop when salt, and the products of its digestion (muriatic acid and the organic salts of soda) are absent. Salt is composed of muriatic acid (hydrochloric or chlorhydric acid, according to more modern systems of naming) and soda (sodium oxide), and its chemical name is 'sodium chloride.' It is unquestionably 'digested' or decomposed in the body the muriatic acid going to the stomach to form the principal acid of the gastric juice, without which digestion could not take place, and the soda, in organic combination, being found in the bile, where it is supposed to aid in the absorption of fat by the lacteals.

FEED FOR WORKING HORSE.—Dr. Stewart says, in the Weekly Press, that the fast working horse exerts the lungs more freely than the slow worker; hence the food should be more concentrated but yet digestible: it should also contain a sufficient quantity of fiber mixed with the finer matter to give masticated food a porous consistence and prevent it from forming a too solid mass in the stomach. Oats are precisely the kind of food required to meet such a case. The husk of oats forms a large portion of the substance of the grain, while the kernel is rich in nitrogenous matter and has sufficient carbonaceous matter to supply all the needs of the lungs, which are stimulated by the muscular action to greatly increased exertion. The oats contain precisely the requisite proportions of fine and coarse matter for the horse's aliment in a sufficiently concentrated condition to avoid overloading the stomach, and are thus the best food for the fast-working horse, which needs no hay. But to get the best results from this grain it should be crushed, and should be fed four times a day, so that the system is never exhausted for want of food. The slow-working horse, on the contrary, the farm horse, for instance, does not require a concentrated food nor such frequent feeding, because its work is slower and the consumption of force is not so great.

TOO MUCH BUTCHERING.—The present bloodthirsty call for the butcher, according to Henry Stewart, is altogether too absurd. If a cow kicks because she has been ill-trained or not trained at all, or if she has her lungs diseased by vicious management, or has been in a stable with a cow which has been known to cough at some time or another, or if the swine are sickened by the filth which they have been forced to swallow with their food, or by injudicious feeding, the butcher is called upon to slaughter indiscriminately. Even the horses which are diseased through breathing foul air of filthy stables are to be butchered, and every other animal which is supposed to have been infected by any one which may have a nasal discharge which indicates some appearance of something similar to glanders. There is nothing said about a reform in the treatment of these animals; of good, careful, kind training, of humane keeping, of clean lodging, of nutritious and wholesome feeding, of any sanitary precautions against disease. Nothing of this kind at all, but only slaughter when our live stock have been made useless by our gross mistakes. And agriculture languishes and farming does not pay, or at least so it is declared. Perhaps there is some connection between these, as cause and result, to some extent.

CUTTING FEED.—A. W. Cheever says, in the N. E. Farmer, that some years ago there were many strong advocates of the practice of cutting hay, and, after wetting it, of mixing in the meal and feed, both for cattle and for horses. Hay and straw cutters were among the most advertised of farm implements, and one or more might be found in almost every stable where even a single animal was kept. But after a while it was found that it was no small task to cut all the hay for a large stock of cattle, even with a horse power cutter, and many who had never fed much grain till the cutter came in fashion thought that whole hay and the same amount of grain given separately might prove quite as beneficial, and set their cutters aside, until there are probably nine cutters stored away unused, in barn lofts or sheds, where there is one in daily use. Many who now advocate the cutting of hay or straw and the mixing with it of meal, argue that if fine meal is fed alone, it does not go to the first stomach, but passes on to the fourth stomach and is washed into the intestines, often only partially utilized. Experiments have been made which do not confirm this view. Cattle have been fed fine meal just before being killed and the stomachs carefully examined. The meal was found in the first stomach, thoroughly mixed with the coarser foods.

SAMPLES.

THERE is no word of three letters in the English language, or any other language, that is so voluminously suggestive as the word rum, says the Western Rural. As you value your happiness and honor and usefulness to yourselves and to the world, touch not, taste not, handle not the accursed stuff.....

BULLETIN No. 20 of the Massachusetts Ex. Station gives several analyses of articles of feed with reference to their fertilizing constituents. Wheat feed was shown to be worth $10.65 per ton; wheat meal, $6.65; corn cobs, $2.52; Vilmorin's sugar beet, $1.25; damaged cotton seed meal, $14.97.....

PROF. GOESSMANN says that herbivorous animals receive these substances directly from the plants; carnivorous animals indirectly, by feeding on herbivorous animals. We feed, at present, our farm stock too frequently without a due consideration of the general natural law of nutrition; to deal out our fodder crops only with mere reference to name instead of making ourselves more familiar with their composition and their particular quality, deprives us even of the chance of drawing an intelligent conclusion from our present system of feeding.....

WE are glad to see that J. J. Thomas, one of our best pomological authorities, condemns scraping the bark of trees for the purpose of benefiting them by killing the insects which harbor under the bark. This is advocated by many rural journals. But Mr. Thomas suspects that the tree is rendered more susceptible to the cold of Winter while few, if any, harmful insects are killed. The R. N.-Y. has always opposed scraping the bark from trees as well as slitting the bark in order to promote the growth of the trunk. Pray, don't waste your time and strength in this way. If you give your trees good food to eat and plenty of it, and cut out while young all the branches that interfere with each other, you have done all that *you* can do to promote their welfare. Leave the rest to nature.....

IT is now about six years or more since the R. N-Y. sent out seeds of the Argenteuil and Red Dutch Asparagus to all of its subscribers who applied. At that time we urgently pointed out to our readers that the best way to raise asparagus was from seeds sown in enriched plots where the seed was to remain, afterwards thinning out the plants as required. In this way we raised asparagus from seeds of all the so-called different varieties that we could hear of. Mr. Peter Henderson now advocates the same thing in a book soon to be published....

THE Farm Journal advises that we sow rye, three pecks per acre, with the buckwheat in June. It will not make much growth, but will live, until the buckwheat is taken off, when it will soon make good fall pasture. Feed it off so that it does not make any attempt to head out, or it will winter-kill. By judicious treatment a fair crop may be harvested next season. Seed with clover in the spring. Don't you see! you will have three crops with one preparation .....

A RAILROAD corporation, it says, has no right to discriminate between its customers than has a grist mill * * * If milk were used more, and beer and rum less, in this country, times would not be so hard, and millions in doctors bills and medicine would be saved.....

DON'T use salicylic acid to preserve fruits or anything whatever, that is to be eaten.....

THE N. Y. Tribune has reduced its Agricultural Department to four columns and the N. Y. Sun has given up an Agricultural Department altogether.

GOODALL'S Sun says: "Lettuce have peas."

S. K. EVERETT, of Cherryville, N. J., says the N. Y. World, one year ago sowed clover in his 12-year-old orchard, where he had muriate of potash and bone for four years. This season he plowed under the clover sod and applied lime. This orchard has put on a fine new growth of wood and promises well for another season.....

DR. HOSKINS says, in the Vt. Watchman, that we want protection that protects—not unconstitutional unworkable statutes, but a plain law that shall compel every ounce of bogus butter to be sold as such, so that every person who buys it shall know just what he is getting.....

Sow corn for fodder now .....

PREPARE for sowing Rutabagas. Large crops are secured by sowing in drills 18 inches apart and thinning out. One pound of seed to the acre.....

NIP off the ends of grape-vines; thin out the pears and apples; remove early peas and prepare the land at once and sow turnips, fodder corn or something else. Cut back the tall shoots of blackberries and raspberries, and pinch off the laterals.....

PROVIDE fresh water for the stock. If ever fresh, pure water is needed, it is needed now. Tie up the growing shoots of grape-vines. Pinch out all but the best shoot of young vines planted last Spring. Pinch out all starting shoots between the leaf and main shoot. Cultivate the late potatoes and see that the leaves are not injured by the beetle. Cultivate the corn field. Keep three inches in depth mellow and free from weeds. To go deeper is to sever the roots, all of which the plant needs.

As soon as the strawberry patch has yielded its fruit, cultivate between the rows or hills. Now is the time to do it. If in matted rows and the patch is to be preserved another year, cultivate between the rows, cutting off the runners. Keep free of weeds, and in the Fall fill the cultivated space with manure, and later the vines should be mulched. Give the young celery plants good attention. Do not allow the soil to become caked or the plants to suffer for water. Beans may still be planted. Sow beet seeds for late greens. The little young beets are among the sweetest and most tender of vegetables.....

NOW, for this latitude, make the last planting of sweet corn. Select a second-early variety, like the Concord. Taking the risks, it may be planted as late as July 15.....

MOVE the sweet potato vines. This is important, as to allow them to root will surely decrease the yield of potatoes.....

CAULIFLOWER plants may be set as late as late July.....

FOR winter cabbage, set the plants now. There are few better kinds than the Large Late Drumhead.....

FOR the late crop, July is early enough to plant celery. Plants intended for November's use may be set now. Remember they must have rich, mellow soil and plenty of water....

WE would repeat our advice to farmers not to sleep in the same undergarments worn during the day. It is more than worth the trouble to take off the undershirt as soon as day's labor is finished, rub the body thoroughly with a harsh towel, and put on underclothes which are perfectly dry.....

YOUNG HOUSEKEEPER (timidly to the butcher): "I will take some lamb to-day."

OBSEQUIOUS BUTCHER: "Will you have a forequarter, madam?"

Y. H. (with more confidence): "I think that is too much for our family: I will take a threequarter."—Life.....

ONE kind of egg plant: A chicken farm....

ORCHARD AND GARDEN is of the opinion that the Erie is the coming blackberry, because it has the iron-clad cane of the Snyder, and the large fruit of the Lawton. The form of the berry is roundish and its quality said to be good. Plants at the Rural Grounds were set last Fall, but they were enfeebled plants and have made but little growth yet.....

THE Farm, Field and Stockman says that if hens are fed but once a day, that one meal should be given at night. * * * The same journal says that there are six different breeds called Spanish, viz., Black Spanish, Andalusian, and four kinds of Leghorn—White, Brown, Dominique and Black. The Leghorns are really of Italian origin. Many prefer the American Dominique to the Dominique Leghorn.....

A GREAT deal of complaint is made by some writers and speakers at farmers' meetings because there are more lawyers in the Legislatures than farmers. Recently Col. Mannard read a paper before the State Board of Agriculture of Indiana in which, among other statements, he complained that only 12 farmers were sent to the Forty-eighth Congress against 273 lawyers. The New York Times sees no reason to complain of this. It is part of the business of lawyers to make laws, for laws are their stock in trade: farmers, on the other hand, are growing food and clothing for the lawyers. If the circumstances were reversed, and 273 lawyers were put to growing wheat and making butter for 12 farmers who were busy making laws for the lawyers, the farmers would be starved and the lawyers would become insane. Let the cobbler stick to his last, said wise old Æsop, and let farmers cultivate their farms while lawyers make and unmake laws. A good farmer growing large crops is a far more necessary individual than a member of Congress, and should feel more pride in the successful management of his business than if he were a poor legislator.....

THE Orchard and Garden has an article from A. S. Fuller about the Peen-to Peach. A reference to the R. N.-Y., page 432 of 1884, would have shown him illustrations from life with a full description from P. J. Berckmans, who sent us the specimen engraved, and Charles Downing. Last summer these peaches were sent to the N. Y. market. The quality is excellent.....

Everywhere.

TRANSCONTINENTAL LETTERS.—LVI.

MARY WAGER-FISHER.

Yreka; the Shasta Valley; mixing the babies; Mount Shasta; Butteville; a night ride; end of staging.

We reached Yreka on time—a town of 1,500 to 2,000 inhabitants, nestled in the mountains

with no outlook, not even a glimpse of Shasta. Here lives the superintendent of the stage company, and here we changed our stage for a large passenger coach, capable of accommodating sixteen, when full inside and out, and nearly every seat was taken. The change was speedily made, and we set out with a fresh and social driver. Yreka is a mining town, with some fairly good buildings—for it has age, such as California towns can boast of, that came into existence after '49. All about it lies the Shasta Valley, a great stretch of level agricultural land, of course requiring irrigation; and there is a water-ditch 96 miles long leading into Yreka, and furnishing water for a large section of country. As we were riding out of the town, I was reminded of an amusing story in connection with it, and upon retailing it, a young man who sat upon the seat with Anaximander, in rear of me, said that it was true; he lived in Yreka and he had often heard it. It was this: In the early mining days, the people, in order to furnish amusement for themselves, had amateur theatricals, and in the hall where they had their plays, they had a bedroom for the accommodation of mothers who could not leave the babies at home. Upon one occasion, a wag, during the play, changed the clothing of the infants, who, in the haste of leaving when the play was over, were recognized by their clothing and carried off. Of course, the parents found upon reaching their homes that each mother had the wrong baby, and it was several days before the children were properly redistributed.

We passed some fine farms, with large, two-story frame houses elegantly framed in trees, and the driver pointed out two as belonging to two of the richest men in Northern California—they were early settlers who had taken up land, and he added that all the men who took up land and farmed were rich, and nearly all who went into the mines were now poor. It is quite characteristic on this coast for farm houses to have a piazza for the upstairs rooms as well as for the ground floor—the upper veranda being generally without a roof. For quite a little distance after leaving Yreka, there were small pine trees scattered about much as in the country about Spokane Falls, in Eastern Washington. Peaches about Yreka have this season been killed by a late frost. The great fields—farms of thousands of acres—were nibbled bare of grass. Here there were fences along the road, and the driver said that the fences were called corrals. At length the sun went down on Mt. Shasta, which rose continually in front of us. The igneous rocks, the conical foot-hills, the near and far-away ranges, the many tints of varied hues were transfigured into a multitude of shades of such colors as yellow, red, and blue. It was a grand and novel sight, and quite unlike anything we had hitherto seen. So individual in its character, and so majestic, we had learned the lineaments of Shasta by heart, and were all ready to declare that we could draw it from memory, so long and intimately had we gazed upon it. Its ascent is not difficult, but tedious, and its summit has probably been visited oftener than that of any other lofty snow peak on this coast. Many tourists visit in Summer one of the valleys near its base—Strawberry—where there are excellent hunting and fishing.

When we left Ashland we intended to stop at Strawberry, a little beyond Butteville, and remain for a few days, but when we reflected that we would be obliged to make the remainder of the stage ride by night, that now the moon was full, the roads good, and ourselves in possession of the most desirable seats, we thought it the better part of wisdom to go directly through—a decision we had no cause to regret. In the summer season the stage company arranges its schedule so that passengers can make the trip by using only the day part of two days; but this arrangement came to an end at the close of what is called the tourist season. It was dark when we reached Butteville, the station for supper, and it was growing quite cold. We had an excellent supper, and a cheerful fire in a tidy, roomy house. There was in waiting a family of six, the father and mother invalids, going from Eastern Washington to California for their health. They had come thus far several days before, stopping for rest, and for a night when they would have more room in the coach—but they had finally to be packed in like sardines, one of the children coughing terribly from whooping cough. One of the drivers told me that a man who lives in San Francisco, and has "liver complaint" annually makes this stage journey to have his liver stirred up, and he refuses to make use of any other remedy. On the top of the stage the jolting was so light that I quite forgot about the miseries of those inside the coach.

After supper we prepared for the night ride, putting on all the wraps we could muster, for we had been warned that it would be cold riding over the mountains, and the Senator who was unable to procure a blanket for his legs suffered very considerably. At Butteville we were furnished with a night driver, a large, pleasant-faced man, who smiled good-naturedly when he saw the small passenger who was to sit at his left. The laddie had fallen into a doze before we had reached the supper station, but from that time on he was thoroughly alert the entire night through until nearly morning, when he fell asleep. Mt. Shasta stands at the separation of the two ranges—where the Coast Range diverges from the Sierra, and this spur of connecting mountains we had to cross, and our entire night seemed to be spent among the mountains—all wooded with magnificent pines—climbing up a mountain laboriously, and then flying down it with our six horses "lickity-split," as the laddie said, and the way in which the driver would turn his six-in-hand around the oft-recurring corners was so admirable that I would not have lost one for much. He knew where was every rough or wet place, and all the tricks played by the shadows, for scores of times it seemed to my eyes that we were driving straight into a river, or against a high wall or embankment, or over fallen trees, when, to the driver's eye, the road lay clear and unobstructed, as it so proved. At length our road lay along a deep gorge, in which rushed the head-waters of the Sacramento River. It was just to the left of the narrow road cut along the ledge, the mountains towering at the right. Many a time in fancy we saw bandits step out from the trees, the shadows of their forms thrown across the road, and at last, about one o'clock, there was no mistake, a live man was in the road ahead of us, in high-topped boots and with a pack on his back. "Your money or your life," cried the driver, laughingly. "Oh, it's only an Indian," assuringly observed the Senator, but when we passed him he proved to be a tramping Irishman. After midnight we passed a camp of railroad surveyors and Chinese, the latter working on the railroad construction, which is being pushed from the California terminus.

Magnificent as was the ride, we all began to feel greatly fatigued toward morning, and the last 25 miles seemed longer than the entire hundred we had traversed. But the end came at last, and we reached Delta in time for the train. We had had 10 relays of horses for the drive. I felt uncertain whether I should be able to stand up on my feet when Delta was reached, but I got down from my high perch safely, although painfully conscious of a reeling tendency. A glance about the dusty, windy, crude town showed evidently enough that it was no place for one to rest in, and covered with dirt as we were, our faces sunburnt almost to soreness, hungry and so weary that I, at least, from nervous exhaustion, was unable to look at the passing landscape, we at once got into the cars and rode on to Red Bluff, where the family of John Brown the martyr once lived for several years, and which an old woman in Ashland had assured me was the prettiest place in the world—could I but see it, I would want to make it my home! We reached it in a few hours, and going to the best hotel called for a quiet room, and after refusing three or four rooms because of the uncleanness of the beds—the one piece of furniture that I looked at with a critic's eye in a hotel—we finally secured an apartment where we could begin the work of ablution and the renewing of our souls and bodies. We slept all of that afternoon and all of the succeeding night, and the next morning were in fairly good trim for further journeying. After breakfast we had an hour or two for beholding the beauties of Red Bluff—so named from the red soil of the Sacramento River beds on which the town is built. There were oleander trees, high as the houses and in masses of bloom, both red and white, great fig and orange trees, superb roses, trimmed evergreens, eucalyptus trees overgrown with ivy—but so hot everywhere and so dry, the mercury in Summer rising in the shade to 116 degrees. Shriveled mountain apples sold for $1.50 the box. Fifteen years ago they sold for $33.00

RURAL SPECIAL REPORTS.

Arkansas.

POTEAU, Scott Co., June 29.—The past Spring was a little late, but a very favorable one for all crops grown here, except oats and potatoes. May was so dry that many failed in getting in a good stand of cotton. But June has been unusually wet throughout, therefore all crops that have been properly cultivated are looking well. Compared with last year, crops are about as follows: Wheat acreage less; yield about the same; oats acreage greater, yield less—about half a crop; corn and cotton acreage the same, prospects better; fruit of all kinds not so good as last year, except it be wild blackberries, which are fine. H. C. B.

California.

DUARTE, Los Angeles Co. June 20.—Corn and wheat good; oats not many grown here, and much rusted; barley the best crop for years; potatoes good; garden truck in abundance; apples and pears half crops; peaches almost a total failure; apricots a quarter crop; grapes promise a very large yield; hay, as well as blackberries, raspberries and strawberries, very heavy; oranges and lemons, our chief products, promise one of the heaviest crops ever gathered in Southern California; walnuts will be a very poor crop next year. Our fig trees are full of fruit—will be ripe in about one month from now. J. S.

Kansas.

STRONG CITY, Chase Co., June 20.—The RURAL'S Marlboro Raspberries all grew nicely last Summer, but all winter-killed to the ground. They are sending up an abundance of suckers which I shall try another winter. Our Greggs were somewhat injured, but are bearing pretty well. Some apple, peach and early Richmond Cherry trees were killed last Winter and others injured. Early in Spring I got $1.00 worth of Japan Chestnut trees—two about eight inches high. The tops of both seemed to have been dead for months; at this date they show no signs of growth. We thank the RURAL very much for its outspoken treatment of monopolies. If every paper would tell the whole truth there would soon be a commotion. Land-grabbers have done and are still doing untold injury to this country. If we want to go to a point three miles west of here, we must travel nine miles to get there, and about the same if we want to go east, or else we must trespass on large inclosed areas, and some places are much worse off than this.

Kentucky.

GREEN CO.—I find your Alaska Pea a very early variety. Planted the same time as American Wonder, it is now (June 19) several days ahead. It came up quicker and blossomed nearly a week earlier. Vines grow of good size and hang full. E. P.

BEDFORD, Thimble Co.—The weather for growing crops has been good through the whole season, but as harvest is now here, farmers are predicting serious trouble in saving their crops. Wheat is generally good, but considerably fallen down and but little has been harvested. It has been raining here most of the time for two weeks, and still raining, with but little indication of better weather. Clover is good; but very little has been cut, owing to the unsettled condition of the weather. Corn was made late and irregular by the cut-worm, and at present has been neglected and is in a very bad condition. Prospects for a good oat crop equal to last year's. Meadows generally good. Stock dull at almost any price, with the exception of good horses and mules, which are in demand. Hogs generally scarce throughout the country. F. M.

Massachusetts.

SOUTHFIELD, Berkshire Co., July 1.—Corn is not looking as well as last year. Oats, fair; potatoes look well. It was predicted that hay would be a light crop, as it was expected to be as forward as the season; I now think we will have a fair crop. Tobacco is doing well—some trouble with cut-worms. Last year was our apple year; prospect of a fair supply this year. E. B. G.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

ANALYSIS OF SOIL.

C. L. N., Tullahoma, Tenn.—1. When chemical fertilizers are used, does any of the fertility remain in the soil for the following year, or does the present crop get all the good of them? 2. Has Tennessee any State Chemist, and how can I get soil analyzed so as to discover what fertilizer it needs? 3. Will bearing grape vines set out in Spring produce fruit the following season? Will they if set out in the Fall?

ANS.—1. Yes. Most of the phosphoric acid and potash remains in the soil if not taken up by the plants. Our friend should know that the three food constituents which chemical fertilizers furnish are the two above mentioned and nitrogen. Most of the nitrogen, if supplied in a soluble form, as in sulphate of ammonia, or nitrate of soda, is either used by the plants or leaches through the soil the first season. If supplied by farm manure, bones horn, hair, wool, etc., the nitrogen becomes soluble slowly and may therefore remain in the soil in a gradually available condition for years. 2. We do not think Tennessee employs a State Chemist. At least four "determinations" or separate analyses would be required to analyze any soil, and the "mean" of those would be the given analysis. They would cost at least $5 each. A serviceable analysis would cost in all about $30, and that would determine only the ingredients of the specimen analyzed. It would not determine the degree of solubility of the various plant foods in the soil, and it is well known that most soils contain a large supply of plant food—enough for many successive crops—but locked up in an unavailable form. You cannot, therefore find out what your soil needs by analysis. Chemists may tell you what it is made of, but they cannot tell you whether it is in such a form that plants can take it up. 3. No, not as a rule. Indeed it would not be well to allow them to bear before the second year. Generally they will not bear before the third season. If, however, grape-vines be taken up with great care, so as to preserve the root fibers, with soil about them, they might be induced to bear the first season. But, as we have said, it would be better to destroy any clusters that formed.

AILING TEATS IN A COW.

F. S., Blair, Neb.—My five-year-old Jersey is to come in in September, having dropped her second calf on June 21, 1885. While milking her three weeks ago, the flow from one teat suddenly stopped. Greater pressure forced out a lump of stringy matter, and the milk flowed freely again—no swelling, heat or soreness apparent about either teat or udder. In a few days it occurred again, and shortly afterwards the same thing occurred in another teat, the first affected appearing all right at that time. Since then it has occurred several times, first in one teat, then in another, and for several milkings all the teats appeared all right. She has not been hurt, so far as I can see; she is driven with a lot of others only a quarter of a mile to and from a good pasture; what is the trouble? How is it likely to affect her milking qualities hereafter? Is it safe to use the milk, especially as a drink for children? What is a remedy? Hitherto the milk from the affected teats has been kept separate, as soon as noticed, but several times a part has entered the pail before we noticed the teat was affected.

ANSWERED BY F. L. KILBORNE.

Judging from the symptoms and the fact that the Jersey is very liable to tuberculosis, we suspect tuberculosis of the udder. It may, however, be simple inflammation due to some unknown cause. If due to tuberculosis both milk and cow should be condemned. The milk is especially dangerous from such animals, being very liable to transmit the disease to any other animal or to persons drinking it. If the difficulty is due to simple inflammation, the cow should soon recover, after which the milk will be good. Try injecting into the teats, after each milking, a solution of five grains each of carbonate of soda and permanganate of potash, in one ounce of water. If the cow does not soon recover, tuberculosis may be suspected, and a competent veterinarian should be called to condemn her if such is the case.

RAISING HUCKLEBERRIES.

L. H. S. (no address).—How are huckleberries propagated—by seeds, layers, cuttings or offshoots? How should they be cultivated?

ANSWERED BY PROF. L. H. BAILEY, JR.

There is undoubtedly a bright future before our huckleberries. It is well-nigh useless to attempt to give any directions for their culture, however, as the sum of experience in the matter is very small. There are no less than 16 wild species of huckleberries in the United States east of the Mississippi. These are known under a most perplexing variety of names. Many of them produce fruit in every way superior to the wild originals of some of our garden fruits. It now remains for the horticulturist to succeed in cultivating them. The difficulties in the way of cultivating are not yet well understood, because almost no cultivation has been attempted. We have set aside an acre upon which to experiment with huckleberries. We shall try all methods of culture of which we can hear, and shall endeavor to grow all the species. We solicit suggestions, and also specimens of the best fruits of any of the species. This Spring I bought from a nursery a few plants of each of the several varieties, but they were evidently wild roots of common species. They amounted to nothing. So far as I know, there is not yet any reliable nursery-grown stock. We shall propagate from wild plants.

Ag. Coll., Lansing, Mich.

CHRONIC CATARRH OF WOMB OF A MARE.

G. H. B., Hearne, Texas.—I tried the remedy for catarrh of the vagina and womb

of my mare, given in the RURAL of May 8, and she improved under the treatment; but as it was getting late for breeding, I put her to a young stallion and over a gallon of malodorous stuff was discharged. I am still applying the remedy, giving little or no corn, but all the grass she wants, together with a little wet bran and nitrate of potash and sulphate of iron. Her stomach seems large; but she keeps up a continuous roaring there; what more should be done?

ANSWERED BY F. L. KILBORNE.

The difficulty is evidently in the womb, and you appear to have failed to reach the seat of the disease. When you introduce the catheter or tube, introduce the right arm with the tube into the vagina until you reach the neck of the womb; then, still guiding the tube with the hand, pass it through the neck of the womb into that organ itself. Now draw off any contained liquid, and make the injection as directed May 8. If you do not succeed any physician can help you. It would be better not to attempt to breed the mare this season.

FERTILIZERS.

J. B. F., Smyrna, Del.—1. We buy screenings from a bone mill for $10, $15, and $20 per ton, and use them on potatoes with excellent results (mostly the $15 kind, which we consider the cheapest of the three for the price). Would it be advisable to mix this kind with kainit and hen manure, and what proportion would be best? 2. What should be mixed with bone screenings and wood ashes to obtain such a proportion of nitrogen as would be needed in a well-balanced complete fertilizer? 3. Would it be advisable to make the mixtures some time before they are wanted? 4. Would they be as valuable as ordinary superphosphate?

ANS.—1. We should not mix the hen manure with the others, but spread it separately. The kainit or bone may be mixed for potatoes in the proportion of 200 pounds of each. But we do not know what the "bone screenings" may consist of—that is, how much bones or how fine or coarse they may be. We do not know whether your land needs more or less of potash. 2. Use 60 pounds of blood or nitrate of soda to 200 pounds of bone and eight to 12 bushels of ashes, or ground fish may be used for nitrogen, in which case one-third less of bone may be used, as the fish also furnishes phosphoric acid. Do not mix until ready to use, otherwise there will be an escape of nitrogen. 3. No, nothing would be gained by it. 4. We can not say. Superphosphate, as the word is used, unfortunately may mean a dozen things besides a fertilizer furnishing only phosphoric acid in a soluble form. Strictly speaking, a superphosphate should be burnt bone dissolved in sulphuric acid, which would furnish phosphoric acid alone.

AILING CHICKS.

J. W. H., Elizabeth, N. J.—What are the symptoms of sickness brought on chicks by eating musty grain? I lost a number from some disease which I can attribute to nothing else.

ANSWERED BY F. L. KILBORNE.

Musty grain is not particularly injurious to fowls, unless fed to young chickens or in large quantities, especially to fowls confined in small quarters. With the young chickens the only prominent symptoms will be the rapid drooping and dying. With the older fowls there may be ruffled and dull feathers, coldness of the skin, weakness or paralysis of the legs, constipation, general dullness or torpor, or perhaps nervous paroxysms. In many cases there will be merely the drooping and death without any marked symptoms. If your chickens are but a few days or weeks old they are probably dying from exposure or unsuitable food. If older, and the fowls of all ages are attacked, it is more like the cholera. By again referring to the late article in the RURAL on fowl cholera, you will find it there stated that any or nearly all of the common symptoms may be absent. While the symptoms of disease in poultry are generally *very unsatisfactory*, this is especially the case with the cholera, and also diseases arising from improper or unsuitable feeding.

SCRATCHES IN A MARE.

W. H. W., Edgerton, Wis.—What is a remedy for scratches in a six-year-old mare?

ANSWERED BY F. L. KILBORNE.

Soak the crusts or scabs with oil for a few hours and remove as much as possible by washing with tepid water and Castile soap. Then apply benzoated oxide of zinc ointment, and cover with a bandage. Repeat if necessary. When you have a clean, healthy-looking surface remove the bandage, and apply daily a spermaceti and almond oil or tar ointment. If the oxide of zinc does not succeed, replace it by a solution of sugar of lead and sulphate of zinc. Internally give five drams of Barbadoes aloes to open the bowels, and follow twice daily with five grains of arsenic in solution and one-half ounce each of powdered gentian and carbonate of soda, and one dram iodide of potassium. Confine the mare where her heels will be kept *clean* and *dry*. Feed moderately, and do not give corn or other heating agents.

GETTING RID OF SORREL.

E. Y., Turnsburg, Ohio.—How can I get rid of sorrel? It hasn't the slightest objection to a rich soil, so that "extra manuring" will do no good.

ANS.—It blooms in your climate in May and later, fruiting in Summer. It is plain that any treatment that will prevent seeding will reduce the crop. It is a perennial, however, and spreads by the roots also. Summer fallowing—the thorough cultivation of hoed crops will subdue it. Until of late lime has been recommended, but careful experiments show that it flourishes under lime dressing as well as in poor soil. Enriching land tends to subdue it simply because it gives other plants a chance to crowd it out.

SWEENY.

J. H., Big Mound, Ia.—My mare got lame in one leg five months ago. Her shoulder has shrunk away just below the top of the shoulder blade, on a space four inches wide and seven long. She is very lame, and in working she doesn't allow the foot to pass back of the center. When she eats grass she rests the foot on the toe. No fever, or swelling, or any signs of injury on frog or foot.

ANSWERED BY F. L. KILBORNE.

Evidently it is a severe case of sweeny, a sprain of the muscle filling the posterior cavity on the outside of the shoulder blade. See late numbers of the RURAL for treatment of mild cases of sweeny. In the present case a current of electricity from a galvanic battery, sent through the muscle for 15 to 25 minutes daily, would probably be the best remedy. In the absence of a battery, buy Spanish-fly blister, or, better still, place the mare in the hands of a competent veterinary surgeon for treatment.

Miscellaneous.

E. A. B., Talladega, Ala.—1. My horse was kicked on the hind leg at the fetlock joint. The place is swollen considerably; what should be done? 2. The fore-quarters of the udder of one of my cows that is about to calve, fill out; but the teats do not; what should be done if she fails to give milk through any of the teats?

ANS.—1. If no heat or tenderness remains, apply tincture of iodine twice a week for a month, or longer. You may, or may not be able to entirely remove the swelling, according to the extent of the injury. 2. The cow will not fail to give milk through these teats if there is milk in the corresponding quarters, unless there is some stricture or obstruction in the duct. In this case an incision will have to be made to open the duct or to remove the obstruction.

A Subscriber, Byron, N. Y.—An acid phosphate of South Carolina rock cut with sulphuric acid, and analyzing about 12 to 14 per cent. of phosphoric acid, with no potash or ammonia, is offered us at New York for $26 per ton. The agent says only $1 per ton is made on it. Isn't the price too high?

ANS.—If it contains 14 per cent. of soluble phosphoric acid, the price is not excessive.

P. S. B., Jonesville, N. Y.—No; there is no duty on imported eggs from poultry. Millions come in from Canada and Europe duty-free every year. Why shouldn't the American Hen be "protected?" Her products run high among millions of dollars every year—without a particle of protection. Foreign fish-eggs have to pay a duty of 10 per cent.

J. W. J., Allen, Md.—This year the May King Strawberry is not earlier than the Crescent. It is not quite so productive, but is better in quality.

J. A. W., Cecil Co., Md.—Spraying with tobacco tea is about the only remedy we know of for the "black beetles or lice" that infest cherry and plum trees.

DISCUSSION.

THE USE OF SALT ON FOOD.

L. C., PHILADELPHIA, PA.—A late RURAL says:

"The National Live Stock Journal, noticing a recent communication in the RURAL regarding the feeding of salt to stock, makes the point that water is wholly innutritious, adding nothing of substance to any structure of the body. It is utterly indigestible, is taken as water, goes the rounds of circulation as water, and is finally eliminated from the system as water. All that can be said of salt in this line can be said of water. But does it prove that water is injurious, or useless? Does it perform no important office in the body, although not digested or assimilated? Water is absolutely indespensable. Without it, neither vegetable nor animal organisms can exist. It is a medium for dissolving all foods, and assisting in their circulation and deposit at the points where needed. Remove the water and everything would be but crumbling dust, to be blown about by the winds. What, then, is the force of argument of the "justly celebrated medical writer and practitioner" against salt? He could not live without a certain per cent. of it in his blood, in which it is a constant element. It attracts water and keeps the blood fluid. In this respect, it undergoes more change than water does. Its crystals are dissolved, while water remains water still, from first to last. Yet one may injure himself by an excessive use of water, as he may by an excessive use of salt; and if he gets into water it will drown the life out of his body. Possibly he might smother himself in salt. But salt is nothing like as dangerous an element to deal with as water."

The National Live Stock Journal is, of course, all wrong. There is no sense in the above argument. I do not deny but that salt is needed in the system, but I do believe that there is enough saline matter in the food we eat to fulfill our wants in that direction. Such is not the case when we eat only the starch of the wheat, as in white bread, or when we pare the potato, boil it and throw the water away. Water is needed in the system, of course, and our food consists largely of water; and if we eat fruit largely, we must not drink if we do not use salt. I neither eat salt nor drink water, and am never thirsty. The use of salt and sugar causes a demand for drink, as I have found by experience. Animals would drink very little water if allowed to graze and were not given salt. You seem to think because the "scientific and practical world" approves of the use of this mineral as food, therefore it is right to use it. But that proves nothing. There are much false teaching and practice in the world, and will continue to be for some time. After a while the world will outgrow this error as it has others. Forty years ago, the use of calomel was considered indispensable to the cure of many diseases; now it is scarcely ever given by physicians. Other drugs have gone out of use, one after another, from time immemorial, because found to be pernicious. Salt will surely take its turn. I propose to think for myself, and not be tied to the opinions of old-fogyism, as the RURAL seems to be. You seem not to value the opinion and experience of "one person" in the matter, and yet are not the opinion and experience of one person who has tried doing both with and without salt, worth the "guesswork" of a thousand who have always used salt? I should say so. There are hundreds, and perhaps thousands, of persons who have stopped the use of salt, and their uniform testimony is that they have been the gainers thereby, and I never heard of one injured by the abstinence. The testimony of a hundred such persons, it seems to me, is worth that of a million bigots who use the drug and think it right because it is the custom approved of by a lot of ninnies of the "scientific" class who never have given a moment's attention to the subject, but simply have taken for granted what they saw in their college text-books. There is not a particle of doubt in my mind that salt, as it is placed upon our tables, is a poisonous mineral, unfit to be used as food, destroying the relish for food and damaging the human system that is brought in contact with it, and ought to be abstained from; but that the body and all its parts may be supplied with its requirements in this direction, our food should be so selected and cooked that its saline constituents be retained and not thrown away. The salts of the grains, fruits and vegetables are in their proper conditions for use, and are essential to health the same as are the magnesia, soda, starch, potash, etc. These last named constituents, taken as we take salt from the salt-cellar, are not wholesome, but as in our food, they play an essential part in our internal economy.

K. S. W., RAVENNA, OHIO.—As the RURAL calls for the experience of others in the use of salt for stock I will give mine. I lived about two years on a mountain dairy ranch in California. It is unusual to see any one there salting his stock, the opinion being that there is enough salt in the dew (being close to the ocean) to supply all that is necessary. The manner of milking there was rather different from ours. The cows were corraled, and in an adjoining yard were the calves. The milker would let one calf into the corral at a time, and as soon as the calf started the cow to give down her milk, the calf was taken away and tied to the fence with a short rope used in bailing hay. Unless we took good care of our ropes, the calves would eat them up. This called forth much argument between the owner and the writer. I, being recently from the East, maintained that the unnatural habit of rope-eating was due to the want of salt, and proved it to my entire satisfaction by feeding the calves salt, after which it was perfectly safe to lay the ropes down, and they would let them alone. Again, horses pastured in a field of Alfalfa would eat the top board of the fence, and I always claimed it was for the want of salt, but I never had a chance to prove it. We pastured about 80 horses in the Fall and Winter on Alfalfa and other rank grasses outside of the ranch. The first season I was there, the horses did not put on flesh as they ought, and their hair did not lie smoothly. I, of course, said it was for the want of salt, and got laughed at for saying so; but to convince me that I was wrong, and that the horses would not eat salt if they could get it, the owner sent over a barrel of salt, and by my instructions, a bag of bran. For two feeds I mixed two parts bran and one of salt. Owing to their greediness for it, I discontinued the bran and gave them a 16 quart pail of salt twice a week. Placed out at night, it would be all gone in the morning, and in a very short time it was apparent that salt was beneficial to them, and we always salted our horses after that. Of course, where cattle were close to the ocean, or where they could get the native salt grass, they did not need salt; but on rank-growing grass, such as Alfalfa, or the native grass in the rainy season, they needed salt. Again, I have never seen a horse or stock of any kind but what likes more or less salt, and I give them credit for knowing too much to eat so much of anything that is not good for them.

W. G. TYRONE, PA.—In May, every year, we see, in closely grazed pastures, luxuriant little mounds of tall green grass, while all around is pale and sere, showing only weak beginnings of growth. On examination we find that each of these verdant spots surrounds a little deposit dropped there last season by some cow or horse, and we are quick to infer that the vast improvement in growth is due to the deposit acting as manure. We feel that manure is everything, and that our meadow is worn out for want of it. Where or how shall we get enough of it to make the whole surface so productive?

In this we are on a wrong train of reasoning, and giving ourselves worry without reason. Manure has very little to do with producing this great and desirable spring of growth. The pile of droppings has yet become soluble but to a very small extent, and could not yet yield manurial nutriment. The growth is due to the cattle having avoided those spots while grazing so that the plants there had a chance to become strong in top and root, the latter having also the advantage of a partial mulch. Where any piece of soil is protected from cattle and from steel for a time it will soon show its gratitude in a bountiful and generous growth. This applies to lawns and door yards. No amount of manure will make up for the injury done to the plant, including its roots, by continual cropping, trampling or shading, without any chance of making a full growth of blades during any portion of the season.

R. N.-Y—Our correspondent's reasoning is partly correct no doubt, but we think not wholly so. The watery portion of the deposits contains more or less plant food in a perfectly soluble condition, and this is carried into the soil by every rain to enrich the land underneath and somewhat beyond the deposit.

E. D. C., THORNVILLE, MICH.—What is the matter with the Alaska Pea? It is a matter of wonder to me where the RURAL could have got the seed to supply all its subscribers with a paper. It is the puniest little object you ever saw. I should think it would take 500 acres of it to go around in the Free Seed Distribution. I inclose a specimen which was raised in good garden soil and well cared for. My market Garden Peas, which came in the Distribution, are the admiration of everybody who sees them. The row is five rods long, planted with the hand corn-planter—four abreast, five seeds dropped in a place, and well hushed. They are covered with flowers and pods, and the foliage is very fragrant.

R. N-Y.—Our Alaska Peas grew to the hight of four feet. All the seed sent out to subscribers was the same, so far as we know. If any other variety was sent, it was the mistake of the origiuator.

E. F. C. ELLSWORTH, WIS.—A poultry specialist in the RURAL recommends lard and sulphur to kill lice on chicks. My wife anointed a brood of a dozen chicks last year with such a mixture, and thereby certainly killed every chick—and perhaps some lice also.

R. N.-Y.—Too much was used, and too much of anything is bad in all cases and fatal in some. Lard stops the pores of chickens and lice alike, and thereby kills the lice, which breathe only through the spiracles or pore-like vents in their bodies. The chick is injured also by a liberal application over much of the body, and where the body is "anointed" with the stuff, fatal results are likely to follow. The usual way is to rub it under the wings and on the back of the chick; the lice congregate chiefly there, or in moving about soon get there, and are killed.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING July 10, 1886.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, JULY 17, 1886.

You can not have fine celery and yet let the plants suffer from drought.

The Rural's "Correspondents' Views," beginning on page 446, seem to us very interesting and full of valuable suggestions. We are always glad to receive such short, terse, meaty notes from our friends.

Mr. Lawson Valentine's Houghton Farm has always had the good of agriculture at heart. Its loss of Major Alvord is the gain of the Massachusetts Agricultural College. We hardly know whether to congratulate the college or sympathize with Houghton Farm.

Here is a half acre of Early Rose Potatoes manured with 10 loads of city stable manure at a cost of $27. An adjoining half acre of the same potato received three bags of potato fertilizer (1,200 pounds to the acre) at a cost of $13.50 for the half acre. Judging by the tops, the latter will yield one-third more potatoes. It is intended to sow rye on the acre this Fall. Which half will yield the better crop? We should guess the half acre which received the stable manure. Let us see.

We are glad to receive the following from Pres. Wilder, showing, as it does, that the Marlboro Raspberry is all that could be desired as to vigor in his grounds: "It is strange that the Marlboro Raspberry should be in your grounds no stronger than the Hansell. With me the Marlboro is the strongest grower of any raspberry, even stronger than the Schaffer. It is a remarkable plant for vigor and hardiness, early (productive if the suckers are kept down), handsome, but not quite up in quality."

A friend in Augusta, Ga., whose letter we have unfortunately lost, has sown carefully selected grains from the Diehl-Mediterranean Wheat and reaped heads both bearded and beardless. He asks us if we think it will continue to sport in this way. Were it not that our friend is positive that he sowed seeds of bearded heads only, we should reply that the seed was mixed. Our own five-acre field of last year was similarly mixed, and we accounted for it in that way. A new variety of wheat should never be distributed until it is fixed, since it is liable to give rise to differently named wheats that are essentially the same.

Judge Barrett, of this city, is gaining an enviable reputation as a "learned judge." Not long since he sent an Alderman to the State's Prison with a sentence ringing in his ears which, for strong and scorching English, has rarely been equaled. Last week he sent a half dozen boycotters to the same place. In sentencing them, he gave them about as much truth as could be poured into a ten-minute speech. This week he has sentenced another lot, and given them, and all law-breakers like them, a ringing warning. This work is well begun. The rich rascals hoped to place bank notes over the eyes of Justice. They are more likely to enter prison on the boots of the people. Foreigners must understand that this is a free country only for those who have sense enough to respect its laws. We have fooled with Anarchists and their kin long enough. Such fellows do not read the long editorials that are written at them, but when the leaders are thrown into prison, the followers are able to appreciate the situation.

This is an "off" year in politics. You can afford to think for yourself. In a presidential election, none but enthusiasts care to break away from party lines. There is no reason this year why you should not do a little training. The oleomargarine bill is the most important, in its bearings upon agriculture, of all that have been introduced of late into Congress. Make it an issue this year. If your Congressman voted against the bill, do your utmost to keep him at home. Vote against him, talk against him, and use all honorable means to bring about his defeat. Don't let him lead you away from the point by bringing up other issues. Pin him down to the subject. Take one thing at a time. Teach these bogus butter Congressmen a lesson, and do it this year. The question is simple. You desire an honest protection for an honest business. The present bill offers that protection more fully than anything that has yet been brought before Congress. If your Congressman opposed it, he is your enemy, and it is your business to try and replace him with a friend.

Farmers who have so much to say against our Agricultural Colleges, often have it in their power to right the very wrongs which they so loudly denounce. They never send their own sons to such schools. The boys go to some literary school and learn that their father uses poor grammer and is behind the times generally, and that their mother is not in style. Fill these despised colleges up with students and there is not one of them that would not rise to the occasion and "amount to something." Too many farmers are absolutely foolish about the education of their sons. There are in every State a dozen or more little institutions whose graduates are a strange mixture of pride, incompetence and conceit. Many a good boy is so thoroughly spoiled by such a course as these institutions have to offer, that he loses many of the best years of his life. Empty the cream of these schools into the Agricultural Colleges and the effect upon the State will be marked. Send your own boys to the Agricultural College. Make them earn a part of their education. Support these institutions if you want them to succeed.

In reading the reports sent out from our experiment stations, one is apt to ask himself, who are these reports intended for. Will they actually help farmers, or will they simply provide an opportunity for scientists to "split hairs" over some unimportant question? The authorities complain that hundreds of these reports are never called for at all. Small wonder, say we, after reading half-a-dozen of them. There is too much jumping at conclusions from a single experiment. The language is too fluent. One is given the idea that the report was to be paid for by the page. Long lists of fertilizers and observations are printed that not one person in 100 will ever read. There is a tendency to copy rather than to originate experiments, and to devote more space to telling how they were performed than to stating what may be learned from them. If such stations are to become popular, that is, if they are ever to gain the confidence of the farmers who really need their aid, they will have to learn the art of "boiling down" the records of their experiments and of expressing them in simpler language. The Directors of such institutions must be men who can "speak as the common people, think as the wise."

BLACKBERRY AND RASPBERRY HYBRIDS.

The anthers of the flowers of both blackberries and raspberries were removed before maturity, and pollen of each was applied to the stigmas of the other. The flowers so treated were covered with tissue paper until the berries set, when mosquito netting was substituted. The cross seems an easy one to effect. One day last week, the hybrid raspberry seeds (100 or more) were planted in a box. The hybrid blackberry seeds will be planted as soon as the berries ripen. We do not know where the idea of hybridizing these two species of the bramble originated. It was first suggested to the writer by Prof. Saunders, of Canada, who has effected the cross, though in what respects the seedling plants differ from the species we are not as yet advised.

A HEARTY GOOD WORD.

We desire to speak a hearty good word for a new blackberry, the Early Harvest. We have or have had nearly every kind of blackberry under test, and this is, without a question, the earliest. It is now, July 10th, ripening a good part of its fruit and the canes are laden. In the same row are Wilson Jr., Early Cluster and the Lucretia Dewberry. The latter has a few ripe berries, the others are merely beginning to change color. The quality of the Early Harvest is the best of any blackberry the writer has ever eaten. The berries are really sweet and the seeds so small that one crushes them between the teeth like those of a strawberry. Again, the form of this berry is perfect. The drupes are small and of the same size as if made in the same mold. They are a jet lustrous black, and though smaller than the Kittatinny, would we doubt not, outsell that variety if placed beside it in the market. The plants are evidently not as hardy as those of Snyder or Taylor, perhaps not as hardy as the Kittatinny. They were set at the Rural Grounds in the Spring of 1883. The canes this Spring seemed much injured by the past Winter, but are, nevertheless, bearing as has been said, an abundant crop.

A NEW WAY TO MULCH POTATOES.

Never until this season has the R, N-Y. raised potatoes under a mulch merely; that is, planted the seed pieces on the surface soil and covered them with (in this case) old strawy leached manure. It seems quite a success, though the wet season has probably made it so. One day last week the writer with a friend had the curiosity to remove the mulch about a hill or so to see what was going on underneath. It was presumed that the roots and tubers were mingled with the decayed straw and that the latter could not be removed without injuring the plant. It was not so, however; the mulch was raised as if it were the cover of a box, and there, crowded together like eggs in a nest, were the tubers and among them and beneath them the roots and the stems which bore the tubers. The sight was a most interesting and, indeed, instructive one. It seemed as if we had taken nature by surprise, and had, without notice, stolen her secrets. It is now evident enough that of the 35 plots or trenches planted to the same potato with different kinds of fertilizers, the one that will yield the most potatoes is one that is mulched in a peculiar way. We call it "valley" mulching. The soil is prepared and leveled. The pieces are placed on the surface one foot apart in the row—the rows three feet apart. The soil between the rows is then hoed or plowed (as preferred) over the pieces so as to cover them three inches. The valleys thus formed between the rows are then filled nearly to the hight of the soil over the seed-pieces with a "mulch" of some kind. In this case it was strawy manure that was spread on the surface last Fall, left there during the Winter and raked in a heap in the Spring. Thus about a foot of soil in width on top of the pieces is without any covering, and receives the sun's rays and the rain; while the mulch in the valleys is supposed to assist in retaining the moisture so received for the benefit of the roots. An objection to mulching potatoes on top is that the ground underneath is kept cold, the seed sprouts slowly and unevenly and the shoots find some difficulty in making their way through it. This particular trench has made the largest growth of vine and, judging from the way in which the soil is cracked above the tubers, will give the largest yield. By this method, the soil is not cultivated from the time the seed is put in, until harvest. All weeds must be pulled by hand. But if the mulch used is old, few weeds will grow.

THE TEMPERANCE AGITATION.

At no former time has the temperance agitation been so prominent, influential and widespread throughout the country. Straight Prohibitionists already control Maine, Rhode Island, Kansas and Iowa, and are running, or, according to present indications, are about to run at the next State elections straight tickets in New York, New Jersey, Delaware, Pennsylvania, Maryland, West Virginia, Kentucky, Tennessee, Missouri, Alabama, Minnesota, Oregon, and probably several other States, while a vigorous social and political movement in favor of "high-license," "local-option" and "anti-saloon" legislation shows the vitality and energy of the "temperance" party in most of the other States also. There is no State in the Union in which the advocates of greater restraints on the sale and manufacture of intoxicants, or even of the total prohibition thereof, have not been making great gains. Everywhere the Prohibitionists—the extremists of the party, who represent the legitimate conclusions of the "temperance" creed—are either forming or keeping up and strengthening their organizations, and preparing for a hot fight when next an opportunity presents itself at the polls. Theirs is a battle chiefly for morality, though it must also involve grave political consequences. In the North, the Prohibitionists at present draw more heavily from the Republicans than from the Democrats; in the South, where Prohibition and "high-license" are making marvelous headway, the case is reversed. Northern Prohibitionist Republicans, however, believe earnestly that their doctrine will be best supported outside old-party lines, and are prepared to run straight Prohibition tickets not only at State but also at Presidential elections. Southern Prohibitionist Democrats, on the other hand, generally think they can attain their ends without leaving their party, and comparatively few of them would vote a Prohibition ticket at a National or even State election.

Through fear of secessions from their respective parties, the stalwart newspaper represenatives of the Republicans in the North, and of the Democrats in the South have, since the last Presidential election, been unsparing in their ridicule, denunciation and vituperation of the Prohibitionist principles, leaders and party. Both the old parties, however, are now willing to concede nearly all the demands of the "temperance" men they can without alienating the "liquor" vote; but the temperance men and women (God bless them!) have "the courage of their principles," and refuse, so far as the Prohibitionists are concerned, to have any political relations with the supporters and propagators of the greatest evil of the age. Both parties have lately been bidding for the support or forbearance of the Prohibitionists. The Republicans of New Jersey are likely to indorse the Prohibition State ticket at the Fall elections, instead of nominating one of their own. The Democrats of Iowa have already indorsed the Prohibition platform in that State, with slight modifications in a few minor points. Both parties appear willing to embody "high-license" and "anti-saloon" planks in their platforms in States where a few years ago neither would listen to such a proposal. Where, as in this State, political parties are pretty evenly balanced, the Prohibition vote can easily throw a State or even National election to one side or the other. The probability is that ere long the out-and-out temperance men will hold the "balance of the power" in a majority of States in the Union, and consequently in the Nation. A party founded on temperance and morality and supported by the votes of the best men and the blessings of the best women in the country, cannot long hold a merely subordinate place in this Republic.

BREVITIES.

We have never known wheat to rust as it has rusted this season, owing, no doubt, to the wet weather. We do not hear of rust in the West.

Wherein does Fay's (Prolific) differ from the Red Cherry Currant? Simply in this: the berries average larger, the racemes longer. The quality is about the same.

At the N. Y. Strawberry Show, a berry of the Hilton, illustrated this week on the first page, measured nearly nine inches in circumference and weighed over two ounces.

July 4th, 5th, 6th, 7th, 8th. From 90° to 93° in the shade at the Rural Grounds, and we are in the middle of the rye and hay harvest. A blaze of heat and sunshine. Is this one phase of the "dark side of farming?"

According to the size of the plant (five feet high), our dwarf Shadbush has borne more fruit than any other plant, large or small. It has been literally loaded with its huckleberry-like fruit, and, unlike our experience in other seasons, the birds have not gathered the fruit for us.

The largest berries of the Nemaha cap raspberry measure (July 5) seven-eighths of an inch in diameter. They are borne in clusters like the Gregg. The berries have a lilac bloom where the drupes join together, above which the drupes are a glossy black. It is as late as the Gregg.

Early Harvest Blackberry gives the first ripe fruit July 3d. It is the earliest blackberry we have ever tested. Though the canes were much harmed by the Winter, the plants are, nevertheless, bearing lots of fruit. The drupes are small, but perfect and of the same size, so that the jet black little berries resemble rubber thimbles.

In speaking of new strawberries we do not feel at all inclined to spare their deficiencies. The introduction of new kinds is so overdone, that praise should be witheld unless the new claimant promises to fill a vacant place. A new kind with the vigor of a Sharpless, bearing more fruit of equal size and better shape and quality, or a Jewell of better quality, or a Parry with stronger plants, would, for example, prove a decided acquisition. But why add to the already thrice too long list of names without adding anything in the way of improvement?

The memory of the "oldest inhabitant" is badly strained in trying to remember a time when vegetables were earlier than they are this year. In old time, through this section, the securing a mess of green peas and a few small potatoes by the Fourth of July was considered a good performance. This year we had peas from our garden on June 19, while on July 3 we found potatoes as large as one's fist. The immense amount of thought given to the improving of early vegetables, the better culture of later years, and the use of concentrated and quickly acting manures, has greatly shortened the growing period of crops. In early maturity, horticulturists have kept pace with breeders of improved stock.

Educational.

THE DARK SIDE OF FARMING.—III.

HENRY STEWART.

THERE are "ne'er-do-wells" in farming as well as in other vocations, and many a farmer who feels that he is on "the dark side" might take aid and comfort, if in no other way, by studying well that delightfully natural and evidently faithful autobiography of Mrs. Mary Wager-Fisher, given on the first page of the RURAL of June 5th, in which she tells how she learned "if she wanted anything accomplished the only way to get it done was to do it, and she has never yet learned any better way." One class of men who live on "the dark side of farming" is made up of those who are given to the vice of procrastination—that "thief of time" which robs us of our best gift and which is ever tempting men to try how not to do it, just at the very time when some important work should be done. Farm work is especially one of times and seasons and opportunities, which, if permitted to pass, do not return until a year has passed. A young man may not think what a year is. He is full of hope—too full at times, living upon it too often. He may think: "Never mind, it is too late now for this year, but it will be all ready next season." Alas! he forgets the truth of that common adage: "The road to ruin is paved with good intentions."

Another man, forehanded, thoughtful, full of plans, but carrying all into execution in good season, lives in sunshine. His crops are good, being put in in good time they get ahead of bad seasons; his plowing is all done in the Fall; his spring seeding is finished while the land is in its best condition; his wet land has been drained in the Winter, and while his procrastinating neighbor has been always going to fix his fences, mend his tools, hang his gates, get his summer fuel into the shed, and do the thousand and one things which should have kept him busy all through the cold weather, and has been gossiping or idling his time away, the forehanded man has been doing all these things. This one has everything needed and ready for use. His hay and fodder got in in dry weather are the best of food for his cows and horses; the stables and barns have every convenience and safeguard; all his fields are well fenced and furnished with good gates; there is a place for everything and everything is in its place. Nothing goes amiss with him, because everything goes by rule and plan, all laid down ahead, and every work or arrangement is done or made before the necessity for it arises. The old story of the man whose barn roof leaked so badly applies just here: when the weather was fine the roof did well enough and didn't need fixing; and when it rained it couldn't be fixed—and so it was never done, until by and by the old shingles blew off in a storm and great damage was done and the cost was increased several times.

There is another old story, too, which has so useful a moral that I am tempted to repeat it. A man going on a journey noticed a nail in his horse's shoe was missing. He thought it would not matter and he could get that little thing fixed when he returned. He started; the roads were bad and the weakened shoe was soon torn from the horse's foot. Then the horse went lame, and in passing a steep, rocky bank it tripped, stumbled and fell and rolled down into the river, and horse and rider were drowned.

Indust'l Societies.

FRUIT GROWERS OF WESTERN MICHIGAN.

(RURAL SPECIAL REPORT.)

Clean cultivation of peach orchards; catching the curculio; marketing fruit; necessity of thinning fruit; trees for timber and fruit; the timber supply; tree peddlers; new fruits.

THE summer meeting of the "West Michigan Fruit Growers' Society" was held at South Haven, beginning on Wednesday evening, June 23d. This society rules over the fruit belt on the east shore of Lake Michigan. The Governor of the State, with his wife, spent one day at the meeting, riding through the orchards and vineyards. He called this shore the "Italy of America." There was a great laugh at his expense when he asked what crop they were preparing the ground under the trees so nicely for. He was not aware that this clean cultivation was continuous from early Spring to the first ripening of the peaches. He learned that after the crop is gathered, the ground is sown to winter rye, to blanket the earth for Winter and to hold the eaves as a mulch to protect the roots. The rye is plowed under in the last of May, and clean culture is practiced from that time until August. He saw the method of catching the curculio. Two sheets are nailed to frames 8x16 feet; four boys, one at each end, carry these on opposite sides of the row abreast of each other, and two men walk beside the sheets; one hits one side of the branches with a padded mallet and the other the other side, and no stop is made until the end of the row is reached, when the little Turks are placed in a tight box until all the rows have been gone over for the day. Hot water is then poured in the box on the accumulations of leaves, twigs and curculios, and left to ferment until the next day, when the chickens are allowed to scratch over the pile and pick out the insects. Sometimes the two rear carriers hang the frames to ropes about their necks and use the mallets. This needs but four persons, while the former method requires six. The trees are loaded with the green fruit and much thinning must be done to perfect it.

H. Dale Adams discussed the "Prospective Overproduction" of fruit this season, and what we are going to do about it. He advocated extending the markets to unoccupied territory, and gave some examples of the folly of sending everything to Chicago and to St. Paul.

Joseph Lannin, of South Haven, had seen many barrels of fruit sent to market that had better have been destroyed. He favored sending only the best, in full packages, as likely to sell readily and prevent a glut in the market. Mr. Bebee thought it better not to raise poor fruit at all. If we take out two peaches and leave one, the one will equal the three in bulk, and be more perfect in symmetry and color, and sell for more money. It is not the pulp, but the seed that exhausts the vigor of the tree, and if but one seed is grown, where three would otherwise have been, the tree is less likely to become exhausted from overbearing. J. N. Stern had never seen an overproduction of first-quality fruit. He never had No. 1 strawberries enough to supply the demand. To get extra-quality fruit, of either apples or peaches, we must thin them out when small; then there is no danger of overproduction. Mr. Williams had picked off 10,000 peaches from one tree and left sufficient for a crop still. If these peaches had remained on the tree, they would have caused the tree either to break with its burden, or become so feeble by the effort to perfect so much seed, that it would have been useless for a year or two afterward.

A. S. Dyckman had had some experience in digging gold in California, but the digging among his fruit trees was a source of much greater happiness. The days were a continuous recreation while in the peach orchard. As long as he lived he expected to be planting peach trees and caring for them. A. C. Glidden could not explain the transforming influences that surrounded the man who cultivated fruit. He only knew that it made a better man of him in every way. He could not be a mean man with everything in nature combining to educate him into a better life. There is a tie of brotherhood between fruit men stronger than the link that binds common humanity.

W. A. Smith made a plea for planting such trees as would furnish both timber and nuts as well as shade. Chestnut, black walnut and hickory were recommended. He believed that one-fourth of the area of every farm should be devoted to the growth of timber.

A. C. Glidden did not entertain such pessimistic views regarding the future timber supply as were usually expressed on this subject. He believed there was still timber enough growing to supply the probable wants of the world. Much of the timber the destruction of which we deplore, is mature, and would constantly decrease in value if left standing. It is a measure of economy to cut it, and work it up while it is sound. We have a good deal of sympathy for the fine trees that stand on some other man's land. We all would probably be as anxious to realize if we owned the timber ourselves. He believed the wants of the future would be just as they always had been in the past. Who knows but that the 100 or more feet of blue clay beneath our feet will yield up its alumina to some ingenious person present, from which our wagons, buggies and tools will all be made. This process once discovered will revolutionize the manufacture of all articles now constructed of wood. It would be a matter of no more astonishment than many things that have happened within the memory of all of us.

A. C. Merritt said the pleasure he derives from a chestnut tree is not due to the thought that it may make 100 rails to the cut, but it is from the thought that he can shake out the nuts from the trees the seed of which he has planted with his own hands. He gave instances of remarkably quick growth in chestnut trees.

J. N. Stern read a paper upon "The Relations of Nurserymen to Fruit-growers." The suspicion which the fruit grower has of the nurseryman has been engendered by the irresponsible or irrepressible tree dealer, for whose chicanery the nurseryman is in no way responsible. The man who grows trees and whose soul is in the work, cannot very well be a bad man. The discussion developed the fact that the fruit growers present had no reasonable complaints to make. Mistakes were sometimes made, but no more than are incident to other branches of business.

The discussion of new fruits of recent introduction was led by that veteran pomologist, T. T. Lyon, of South Haven. He was very conservative in his recommendations, and said there were many kinds that had been heralded with a flourish of trumpets, that must eventually go to the wall. W. A. Brown, of Stevensville, said there was an uncertainty attending the cultivation of new varieties, which prevented their acceptance to replace old favorites. We doubtless must bid goodbye to the Wilson Strawberry, on account of blight on the foliage, and it is a great question what variety shall replace it. Possibly if we had a thorough knowledge of some of those newer kinds, there might be some that would be acceptable. The Turner Raspberry still holds its own with the Cuthbert. It will stand on the plantation 15 years and remain good, while the Cuthbert will run out in two or three years. Mr. Bronsen, of St. Joseph, pinned his faith to the Sharpless. He had exhibited berries of that variety this year that made a quart with only 13 berries. One of them measured 8¼ inches around. He selected his plants from those growing on very rich soil, and believed in selection in strawberry plants as well as in anything else.

At the evening session statistics were given showing the number of peach trees in the counties of Berrien, Van Buren and Allegan. In 1885 there were 5,469 acres planted. The number per acre runs from 105 to 135. This would give over 600,000 trees in the three counties, but all are not yet in bearing.

HORNELLSVILLE FARMERS' CLUB. Fig. 284.

Architecture.

HORNELLSVILLE FARMERS' CLUB.

A LIVE, practical farmers' club can work an immense amount of good in any community. The Hornellsville Club has been remarkably successful, and this success shows what grand results can be accomplished in any community when energetic farmers are disposed to combine. Less than three years ago a dozen practical farmers met at the City Hall at Hornellsville, N. Y., and "resolved" that it was the desire of the persons present to form a farmers' club. It was decided that the meetings should be held the first and third Saturdays of each month for the purpose of discussing topics relating to the everyday life of a farmer. The discussions were of the nature of plain business-like talks, with some well posted person to open and state his views, so that the others could oppose or substantiate his statements. These discussions were widely quoted and the result was that the membership was very rapidly increased. With this increased membership came an increased influence. It was soon felt that a larger meeting should be held each year, a meeting large enough to attract exhibits of manufactures from all parts of the country so that farmers might see and discuss the latest inventions in agricultural machinery. To secure the funds needed to hold these meetings, the club organized under the laws of the State, and issued shares at $10 each. Members were thus enabled to contribute large or small amounts as they desired. Stock was freely taken: and today the club holds, partly leased and partly as its own property, one of the finest exhibition grounds in the country. At every exhibition all available space has been overrun and an additional strip of land has just been bought for $4,000. On this land an exposition building is to be erected with many pens and stalls. A picture of this building is shown at Fig. 284.

Pomological.

THE HARDINESS OF TREES.

Hardy trees needed in the West; the kinds we can and can't grow; influences supposed to affect hardiness; of what does hardiness consist? hardiness an inherent quality.

THAT quality which enables a tree to endure a low temperature is an all-important one to the Western planter. Eastern men find comparatively little limit in their choice of the different fruits and their varieties, but on the broad Northwestern prairies the list is cut down by the extremes of climate to a few varieties and to fewer kinds. In pears, nothing is yet known. All selections introduced and tried have failed, either from blight or cold, or both. Our hopes now are that some of the Eastern Europeans being tried by Professor Budd at the Iowa State Ag'l. College, may succeed. Of apples, the only well-tried, profitable and productive variety we grow is the Duchess. A few others have been a partial success in congenial localities, but not to the general planter. Of course, there are great hopes of enlarging the profitable list, but it can be done only by meeting the cold Winters with something hardy. No peaches or quinces worth mentioning are grown north of the 40th parallel. The Early Richmond and English Morello Cherries are much planted, but we would have more fruit, if they were hardier. The large European plums are absolutely tender. Our wild native race is hardy, and offers so good a field for selections in size and quality that it is only a matter of time when we shall have all of this fruit we want. In this short outline of the existing conditions of our fruit trees is shown our need of inquiry into those questions which control the problem of hardiness. So many thousands of orchards are almost complete failures and so many of our planters have been disappointed that we are keenly awake to any light which will help to a practical solution of the question.

Many farmers who have suffered losses in their orchards have given the subject but a passing thought. Those who have studied it have placed more or less stress upon some particular condition, ignoring the fact that there is a multitude of these, each of which is more or less potent: growing Falls, dry Falls, wet weather just before freezing, spring freezing and thawing, sickly summer growth and many other causes are emphasized. These have led to a mass of theories and conjectures, some of which are directly opposite. Let us examine and try to get the facts. It is commonly held that trees which grow late in the Fall are tender. This is only half true, as established by experience. The quite rugged Roman Stem Apple is a late grower; Nos. 257 and 413 of the Russian apples are late in ripening their wood and very hardy. The never-injured Tetofsky and Whitney hold their leaves until freezing. Nor is the habit of early ripening of the wood a certain indication of hardiness; for many early-maturing varieties, like the Red June and the Chenango Strawberry, are quite tender. As to wet Falls and frozen wood cells, let the theorists settle as best they can. Some are now asserting, contrary to old belief, that the losses of past hardy varieties were from lack of water in the Fall. Some trees, like the Wallbridge, are great absorbers of water and grow soft shoots, yet are quite hardy. Others with like nature are tender. Among those which do not use much water, some are hardy and some tender; the same facts are found in comparing the different slow and fast-growing varieties. No tree is hardier than the vigorous crabs, nor more tender than the slow-growing Early Joe.

Since one tree will show a nature entirely different from another's growing by its side, we must conclude that it is owing to something different from the surrounding conditions. It is the nature of the tree, in the tree itself. It was inherited. Quality, shape, color of fruit, the leaves, the habit of growth, the hardiness to endure heat, cold and disease were all given it by its parents. If it is not naturally hardy enough to endure a low temperature, it is useless to conjecture, when its death comes. It comes in the usual order of events as a natural circumstance. We must aim to suit natural circumstances, and, because we do not succeed, we must not claim that they misuse us.

Lincoln, Neb.

Miscellaneous.

NOTES AND NOTICES.

STOCKMEN all over the land, and especially those of the South and Southwest, will receive with gratitude and satisfaction Mr. Woodward's recommendation and indorsement of crude petroleum for skin diseases, wounds, and above all, for the scab. The doses used to cure the scab are many and various, half the time not effecting a radical cure, and always troublesome to prepare and bothersome to make use of. That the worst cases of scab can be readily cured with one thorough application of crude petroleum, and that it can be applied without danger to the animal or much expense or labor to the owner, are facts worthy of the widest publicity.

It was thought when the self-binding reapers came into general use, that the farmers' wives and daughters would be relieved of as much of the hardships and drudgery inseparable from the small-grain harvest, as they ever would be, nobody imagining the horrors of thrashing week would ever be altogether avoided. But the world moves, and though in some things we appear to be going backwards, in more the movement is in advance. Lately a new idea has been suggested in grain thrashing. It is for the organization of a company of men to do the thrashing, the stacking of the straw, and the delivering of the grain tied up in sacks, or put into the granary, at a fixed rate per bushel, the company to carry its own grain and forage for the horses, or to buy them of the farmer, furnish and cook the provisions for its men, carry a tent in which to cook and sleep, thus relieving the farmers' wives and daughters of the drudgery of cooking for a large gang of men and cleaning beds afterwards. This latter because the men are necessarily dirty from their work, and not infrequently so through carelessness and indifference, if nothing worse. When such companies organize in the regions where the small grains are leading crops, we may look forward to see them have a monopoly of the business, for it will suit the wife and daughters no less than it will the average farmer, whose experience has taught him thrashing week and the preparations that have to be made for it, are the most laborious, trying and exhausting of the year.

Have we reached the safe limit of the introduction of labor-saving machinery? Many seem to think so, and those so thinking are not, as might be supposed, laboring men or mechanics. Those I have heard so express themselves were farmers of means and intelligence, prosperous manufacturers, and some few who have read much, observed widely and thought long. The occasion was a contest of tile ditching machines, and the turnout to see it was a large one of every trade, occupation and profession. The machines did excellent work and enough of it to show their superiority to hand labor. Still the general sentiment of the majority was, or appeared to be, that there were labor-saving machines enough, and that something must be left for the laboring man. B. F. J.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

NURSERY SONG.

From Good Housekeeping.

PACE, pace, pace—
That's the way the ladies ride.
Foot hung down the pony's side—
Pace, pace, pace.
Pacing gently into town
To buy a bonnet and a gown;
Pacing up the narrow street,
Smiling at the folks they meet—
That's the way the ladies ride.
Foot hung down the pony's side—
Pace, pace, pace.

Trot, trot, trot—
That's the way the gentlemen ride,
O'er the horse's back astride—
Trot, trot, trot.
Riding after fox and hound.
Leaping o'er the meadow's bound,
Trotting through the woods in Spring,
Where the little wild birds sing—
That's the way the gentlemen ride,
O'er the horse's back astride—
Trot, trot, trot.

Rock, rock, rock—
That's the way the sailors ride,
Rock and reel from side to side—
Rock, rock, rock.
Jack Tar thinks he's on the seas,
Tossing in a northern breeze;
Thinks that he must veer and tack,
When he mounts a horse's back;
Rocking east and rocking west,
Jack tar rides, dressed in his best—
Rock, rock, rock.

Sleep, sleep, sleep—
That's the way boy Ned will ride,
Floating on the slumber tide—
Sleep, sleep, sleep.
Out upon the drowsy sea,
Where the sweet dream blossoms be,
Far away to Sleepy Isles
Sails by Ned. "Good night," he smiles;
Sinking down in pillows deep,
Little Ned is fast asleep—
Sleep sleep, sleep.

—ANNE M. LIBBY.

OF INTEREST TO WOMEN.

WE commend to those courageous sisters who agitate on Women's Rights, Women's Wrongs and everything for women with a capital W, the list of women's rights suggested by the Chicago Living Church:

The right to watch while others sleep,
The right o'er other's woes to weep,
The right to succor in distress,
The right when others curse to bless,
The right to love when others scorn,
The right to comfort all who mourn,
The right to shed new joy on earth,
The right to feel the soul's high worth,
The right to lead the soul to God
Along the path her Saviour trod;
Such woman's rights God will bless
And crown her champion with success.

These agitators on the question of feminine suffrage might profitably turn their attention to another field—the question of women's work. A Plainfield paper very pertinently asks why, in all the vigorous efforts now being put forth throughout the country for more wages and less work, the wives' side of the question is so little considered? The next time a procession of laboring men on a strike parade your streets, just hunt up their wives and ask them about their work. They will tell you that they rise at five or half-past in the morning, get their husband's breakfast, get the children off for school, do the washing, ironing, baking, sweeping, and scrubbing, care for the little ones, get dinner, do the hundred odd jobs so necessary to a pleasant home, yet of which the husband knows nothing, and then their sewing and mending till 10 or 11 o'clock at night. They work over hot stoves in Summer, and in cold rooms in Winter. Sickness even brings no release if they can possibly compel their wearied bodies to perform their appointed tasks. Sunday's work is but little less, and Thanksgiving and Christmas mean extra cares.

Week after week, year after year, with only an occasional afternoon or evening respite, the work goes on. What do these women know of leisure? What chance have they for self-improvement, for true growth? What compensation do they receive for such a toilsome life? Cheap food, poor shelter, poorer clothes. And what do they think of strikes? How many would there be if they were consulted? Few, very few. Having been forced to a life-long study of the subject they generally understand economy better than their husbands. They know that half a loaf is better than none, and they realize that no work means no pay. They know, too, that the burden of reduced expenses must fall most heavily upon them. When the income grows smaller they are told they "must economize." How can they do it? Not by reducing the expense of the table. Oh, no! their husbands don't mean that. It must be done by denial of self and little ones. The already shabby clothes must be worn another year. There must not be one concert or lecture, and not even one day's excursion to the woods or seashore. Fuel must be used most sparingly, when the husband is not at home, and not one cent must be spent for that which is not a genuine necessity. Meanwhile the husband goes on with his smoking and beer drinking. If the strikers gain their point, how long will it take them to make up what they lost in days of voluntary idleness?

CHILDREN WE MEET.

TAKING children as miniature men and women, some study of their peculiarities, characteristics, and naughtinesses is interesting to us all, and we are somewhat of the opinion of that writer who says: "Beware of the man who hates children and music. He is not to be trusted." Nor do we exactly echo the opinion of Charles Lamb, who, when asked by a proud mother, how he liked babies, answered with his amusing stutter: "Boiled madam," and who said he could not imagine what people made such a fuss about children for, "they are so common."

We might begin our discourse as the small boy begins his school composition, and say: There are a great many kinds of babies truly, there are babies and babies, crying babies, fretting babies, solemn babies, crowing babies. The kind we regard with the most unmitigated abhorrence is that variety which wrinkles up its small features until it looks like a map of the United States, stiffens its entire person as if it were petrified, and then delivers a yell that would curdle the blood of a Sioux chieftain. And then the fond mother proceeds to compose the nerves of that infant with the art and blandishments known only to mothers, just as if it were not the nerves of baby's audience that really required to be composed.

But it is only when children begin to talk that the full extent of their virtue or depravity can be known There are occasionally those pure, angelic children who seem, like Aldrich's "Babie Bell," to have wandered from Paradise; and, opposing them, are those infantile fiends, whose pitiless logic, keen sight, and precocious minds make them the terror of all who meet them. All children are apt to make startling remarks at times, for they view the great phenomena of the world from the standpoint of their own small experience; but these terrible children seem to do it as much from a desire to make people uncomfortable as anything else. Woe to the unlucky one who possesses some personal defect when in their presence. It was a little cherub of this description who publicly told a lady showing traces of the dentist's art, that she had copper-toed teeth. Upon the whole, we think little girls of this description are more dangerous than little boys. They go off more unexpectedly, as it were, and, true to the natural instincts of their sex, have more to say.

After all, these naughty children are more interesting to most of us than abnormally good ones, like those in moral story books who keep on getting better and better till they finally die. They always die, and the bad ones live on to an evil old age.

Many children are tryingly mischievous, simply because they have no proper outlet for their energy. Who has not seen some poor little victim at school nervously trying to fix in his slippery memory some incomprehensible rule, and looking the picture of youthful misery, laying up a series of penalties for negligence and inattention when he would be far better employed developing his mind and muscle at once out on some green hillside or by the shore of a breezy river. With all our fine methods of higher education, it seems we have not yet arrived at the proper means of producing the sound mind in a sound body. When we teach children to think and reason, instead of cramming their small brains with a mass of undigested knowledge, we shall be nearer the millennium in education than we are at present.

HEALTH AND HAPPINESS.

A SOUND mind in a sound body is the most desirable combination in the world; pity it is that they are not invariably associated. But alas! daily we see a little dwarfed, misshapen mind inhabiting a straight and shapely form, or a bright mind placed in an undeveloped body, like an ill-set jewel. If only our outer form—our earthly prison—could present a reliable index of our mind! but as Mrs. Gamp says: "Our characters is not writ on our foreheads, which is fortunate for some people." But though change of actual form is impossible to us, change of expression is not, and sound health, cheerfulness, unselfishness and purity develop a greater beauty than mere attractiveness of feature It sounds materialistic to put sound health before all other virtues, but really, everything else depends upon it. Perfect health gives serenity of mind; it gives the possessor a greater sympathy and helpfulness for others; that is, when accompanied by the well-balanced mind. The sound body only, without the cultivated mental power, produces a fine animal, but not a fine man, going to the other extreme, we have such educational monstrosities as Dr. Blimber's immaculate young gentlemen, who were forced into intellectual bloom so early that they speedily ran to seed, and spent the last year or two under his charge in forgetting all they had previously learned.

Moral qualities, as well as mental, greatly depend on one's bodily health. It is more than probable that Henry VIII would have disposed of fewer wives had he been free from suppressed gout, while his daughter Mary, of cruel fame had her rancor against the Protestants much increased by constitutional biliousness. According to some historians the great Napoleon lost Waterloo, not so much by his marshall's delay, as by an attack of indigestion caused by a surfeit of mutton, stuffed with onions—an impressive warning against that particular dainty.

What must we do to produce that sound body, which is the fittest temple of a sound mind? Ay, there's the rub, and it seems easier to say what not to do. We must remember first of all that in this case most surely are the sins of the parents visited on the children. A father intemperate in food or drink or disposition—a mother fretful or frivolous, or sickly, will transmit their own frailties of mind and body to their children in an increased ratio. And if children receive the happy birthright of sound health the added dower of sound mind depends much on their parents. If father and mother neglect in their own persons the attempt to advance mentally and morally, they scarce can wonder if their children neglect it.

It is almost pathetic to witness the sublime faith of children in their parents capabilities, and it is the bounden duty of every parent to deserve that faith, by all means possible. So, by advancing personally, in mind, body and estate, we are advancing the powers and possibilities of future generations, and blindly working for our ideal millenniums like the coral insect that unthinkingly toils and perishes, until a new land arises above the lonely sea.

GOLDEN GRAINS.

TEACHING by mere precept, in telling others what to do and what not to do, says the Independent, is much easier than teaching by a living example. It is the latter kind of teaching, however, that is generally the most effective, and best illustrates the sincerity of the teacher. Christ taught in both ways, and with equal perfection in both. .....

A GOOD many people act on the advice of the venerable philosopher who said: "My son, never waste your time—not a moment of it; always waste somebody's else."... .....

AT a recent meeting held at Bradford, England, to consider the question of non-attendence at church on Sunday, the following recommendations were agreed upon: Earnest and simple preaching of the Gospel; hearty singing, in which all can join; free seats; constant efforts on the part of Christains in the way of tendering invitations to others to come and worship with them or to go where taste directed; deeper interest in the spiritual welfare of the young, the necessity for prayer for the outpouring of the Holy Spirit.....

IF every member of the Knights of Labor would only pass a resolution to boycott strong drink so far as he is concerned, for five years, and would pledge his word to study the labor question from its different standpoints, we would then have an invincible host arrayed on the side of justice..... .....

RUSKIN says: "It is only by labor that thought can be made healthy, and only by thought that labor can be made happy; and the two cannot be separated with impunity"..

MR. RICHARD BAXTER, when on his deathbed was visited by a friend, who reminded him of the glory to which he was going, and that his many good works would attend him into a better state. The old gentleman lifting up his dying hand and waving it, replied: "Do not talk to me about works; alas! I have dealt too much in them already."..... .....

HAZLITT truly says: Prosperity is a great teacher, adversity is a greater. Possession pampers the mind; privation trains and strengthens it..... .....

THE deepest love is that which owes its origin to some sweet sacrifice. The strongest inspiration is that which owes its origin to such a love.....

WE should not halt between two opinions, or regret a choice after it is made. A good maxim is that of an old writer who said: "Never worry over what can be undone, but go to work and undo it; nor over what cannot be undone, because it cannot be undone."....,..

THE Rev. J. Heber Newton says religion is the bond of life; the bond between the actual man and the ideal man, binding effort loyally to aspiration; the bond between man and nature, holding will obedient to law; the bond between man and man, knitting men together unselfishly in a human brotherhood; the bond between man and God, rooting the finite spirit conscientiously in the Infinite Spirit .

WHAT could the Infinite Spirit, whom we call Father, do toward the higher life of man so effectual as to bring into being a child in whom all choicest influences should concentrate; on whom all favorable conditions should wait as spirits of benediction; who should thus grow into a model man, living as a son in the Father's house, walking as a gracious example before all the other children? This is the Father's gift to man in Jesus.....

THE pastors of Cleveland have united in an address to the Christians of that city, calling attention to the growing disregard of the Sabbath, which they attribute to "mental unrest, worldliness and spiritual apathy." They speak of the reading of secular newspapers on

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

Sunday as causing great spiritual loss, and advise all members of churches to quit buying and reading secular Sunday newspapers.....

THE serene, silent beauty of a holy life is the most powerful influence in the world, next to the might of the Spirit of God.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

KITCHEN TALKS.

ANNIE L. JACK.

WE were talking of foods at table the other day and the head of the family advocated the free use of cheese during the summer months, as more suitable food. He was reminded of the fact that one Autumn not long ago the physician blamed cheese as the cause of a severe bilious attack. But he would not be convinced, saying in reply that one pound of skimmed-milk cheese, if cooked properly supplied more nutriment than three pounds of beef. It is a curious fact, said the Student, that every country has its favorite diet—or rather national dish. Now the Italian would enjoy your cheese grated with macaroni, while the Scotchman would rather have his oatmeal porridge, the Irishman his potatoes, and the Englishman his beef. Our French Canadian population enjoy pea soup, and the New Englander his brown bread and baked beans, while the Southern negro thinks there is nothing equal to hog and hominy. Scientists affirm that fish is the best brain food and that asparagus will restore exhausted vitality as nothing else but raw eggs can do. Yet how little we think of the ill or good our food will do when preparing, or when eating it. "I don't believe in pork and potatoes," said the Critic scornfully. "Yet I notice you can hide away quite a plateful" said the Jester of the family amid a general laugh. "Yes, on a cold winter's morning," he began in defence, and the Student interrupted, "That's where the difference comes in. Now it is Summer, and we need cooling fruits, boiled eggs, light, dainty dishes of various grains, such as are used in a tropical country all the year. There is no craving for fat meats, or heavy food with the thermometer in the nineties, but when it goes down to zero we are fain to mildly follow the example of the Esquimaux and take in some carbon to keep us warm.

But during the heated term, cooling salad, and juicy fruits are needed to allay fever and thirst. Strawberries and raspberries are wisely placed within our reach when the system requires ripe fruit, and it is only when unripe, or stale that it proves injurious.

It is strange how true the saying is that what is "one man's meat is another's poison" for one member of our family cannot taste strawberries, the very aroma causing nausea, and an attempt to taste one resulting in a sudden rash all over the body, and a tendency to fainting. Another, who is not easily daunted by anything, dislikes the smell and taste of milk. This, I consider quite an affliction as milk contains all the elements necessary to nourish the body and will keep up strength when other things fail to do so.

A good healthy appetite is a "consummation devoutedly to be wished," and none need despise it. "You look cross" I said to a gentleman lately, and he answered simply—"I havn't had my dinner." This may look absurd to some people, but the stomach doubtless influenced the mental faculties, and he was a man of consequent "crossness." True it is that "civilized men cannot live without cooks," and so we may be proud of our calling, who have to cater not only for the stomach, but for the brain and temper, and heart.

ODDS AND ENDS.

A VERY successful washwoman of my acquaintance puts a teaspoonful of kerosene into starch for from 12 to 15 shirts, to help gloss bosoms, says she has tried wax, etc., and different preparations, and likes this best. She certainly does excellent work.

How many of the RURAL readers know of and use pulverized borax as an addition to the toilet? One teaspoonful in a quart of water in which you bathe hands and face, removes dirt wonderfully and leaves a very nice feeling to the hands. Five cents worth lasts a long time.

Try a sweet potato pie; made much like pumpkin pie, but instead of (as many do) cooking potato, grate first the raw potato into the pie.

I found and tested a new and excellent remedy for diarrhea this Summer. Eat a handful of "sourgrass" or ground sorrel, and take a drink of water. If one dose does not check repeat later in day, or next day, usually one dose is enough. It is harmless, easy to take and much to be preferred to paregoric or laudanum.

E. E. BROWN.

DESIGNS FOR QUILTS,

Fig. 289 is known as the Philadelphia pavement pattern. Fig. 290—the basket—originated with me and is very much liked by those who care for elaborate quilt patterns.

MRS. E. ANNIE WRIGHT.

BREAD AND BISCUIT.

"The Gods know that I speak thus in hunger for bread."

It is a trite expression that the fault of poor bread lies oftener with the cook than with the flour. One would think that since Shakespeare used the expression, "Crammed with distressful bread," he must at some time have had a cook not unlike many of the present day. A lady who has a reputation as a bread-maker *par excellence* furnished me with the following, which I send to such of your readers as may have trouble in making good bread, with the assurance that it may be relied on: One cake of compressed yeast is sufficient for four medium-sized loaves of bread. Crumble the yeast into a bowl, being very careful not to handle it too much; sprinkle on it two teaspoonfuls of sugar and pour over a pint of warm water. In the course of ten minutes the yeast will have risen to the top. Then stir it until it is all dissolved. Sift dry flour into a deep tray; the question of quantity is a delicate one, as various brands of flour are unequal as to the amount of gluten they contain, but it is safe to start with two quarts. Make a hole in the center of the flour and pour in the yeast. Stir in the flour lightly from the edges until you have a thick batter; sprinkle salt (a tablespoonful for each loaf) around the edges where the flour is heaped up, taking care to keep it away from the sponge, as it is apt to give it a slightly bitter taste. Set the pan in a warm place. It is most important to keep it from draughts. If the temperature of the room is warm and even, say 70 deg. Fahrenheit, the bread will be nicer if it is raised away from the fire; otherwise it must be kept moderately near. In an hour the sponge will be light and feathery. Knead the bread with slightly warm water, another pint at least. Never use entirely cold water, but always have it warmer on a cold day than on a warm one. Knead the flour in slowly; good kneading is essential to good bread. If kept at the right temperature it will be light again in three hours, when it should be again well kneaded and moulded into loaves and put into the pans. In another hour it will be ready for the oven, and if the above quantity has been divided into four loaves, they will bake in forty minutes. The oven should be sufficiently hot to brown the loaves in twenty minutes, after which the oven should be cooled somewhat and the baking finished slowly.

Almost every one has a way of her own of making biscuits, but a friend assures that neither with her own nor with anybody else's way can she succeed in making anything but a heavy and unpalatable article. I told her to try the following:—Sift thoroughly through one quart of flour, three even teaspoonfuls of baking powder and one of salt. Mix to a soft dough with very cold milk, and handle as little as may be; roll out an inch thick and cut with a small cake-cutter. Place them on a buttered tin, and bake in a quick oven. They are very nice if rolled less than half an inch thick, and placed one on top of the other two deep in the pan. Sour milk biscuits are made somewhat differently, and are nice for variety, as they also taste very different from those made with sweet milk. Sift three pints of flour into a bread pan, and make a cavity in the centre; pour into this one pint of sour milk in which has been dissolved a tablespoonful of salt, also four tablespoonfuls of sour cream, and one teaspoonful of soda, even measure, dissolved in two tablespoonfuls of hot water. Stir quickly together with a strong spoon. Dip the hands into dry flour and mold into small biscuits flattened to half an inch in thickness.

Corn bread is another much-abused article, but delicious if made after the following recipe: Beat one egg thoroughly with a tablespoonful of cold water, stir in a teaspoonful of salt and two of white sugar. Add two-and-a-half cups of sweet milk, two heaping cups of Indian meal, one even cup of wheat flour, through which has been sifted two full teaspoons of baking powder; lastly a tablespoonful of melted butter. Beat very hard for five minutes. Put in a quick oven and bake steadily.

A notable housekeeper has given me this recipe for making yeast, and as many of the readers of the RURAL live in the country where fresh compressed yeast cannot always be had, I think it may prove useful. Boil a good-sized handful of hops in two quarts of water for two hours. Mix one cup of flour smooth with cold water, and over this pour the water in which the hops were boiled. The hops should be tied up in a small muslin bag before being boiled. Stir in three tablespoonfuls of sugar and two of salt, and when cool enough, or rather when lukewarm, add a cake of compressed yeast that has been dissolved in a cup of warm water. To make bread with this yeast use half a cupful for five large loaves; set a sponge at noon, mix the bread in the evening, mold and bake early the following morning.

PALMETTO.

HELPS.

IF you do not use the patent perforated pie plates, make your old tin plates over by taking a hammer and small nail and putting some holes in the bottom of them, thus allowing the steam to escape and preventing the paste from being a soggy mass.

Rub the bottom of your sauce-pan in which you boil milk with a little butter to prevent the milk from sticking.

Before putting your rolls into the oven to bake rub the edges with a little sweet fat and you will find that they will not stick together when done.

A very delicate cake may be made by taking any good sponge-cake recipe and baking it as for jelly cake, allowing it to be about an inch in thickness when baked. Take one pound of almonds, blanch them and pound them in a mortar, a few at a time, using rose water to keep them from oiling. When all are done, stir them into a pint of cream, to which you have added sugar to sweeten it to your taste, and vanilla to flavor it. Let the cake be cool when you spread your almond cream between it and over the top.

Inexpensive, but very effective portiéres may be made of double-faced Cantou flannel. Any shade can be used, but peacock blue with a border of cream-colored felt with applique figures or flowers stiched on them, will be very handsome, costing but little time in the making and expense for material.

A bag for soiled linen may be made of linen crash lined with turkey red, having a hornet's nest embroidered on it in outline stitch.

AUNT ADDIE.

DOMESTIC RECIPES.

EXCELLENT EGGLESS PAN CAKE; MUSH; PIE.

TAKE two and one-half cups of flour, a little salt, and two teaspoonfuls of cream of tartar stirred into the flour; mix with buttermilk and part sweet milk until the batter will drop from the spoon, then dissolve one teaspoonful of soda in water, and beat well. Fry in hot drippings.

Mother makes the best dish of mush I ever ate, much healthier than fried. Take part sweet milk, part water may be added, let it come to the boiling point, add salt, then stir in cornmeal until thick, boil well. Put some butter in a skillet, break up some bread in very small bits and slightly brown, then put a layer of bread and a layer of mush, then serve. I think rather coarse cornmeal is best for this.

To-day for dinner we had pie made of a mixture of boiled dried apples and canned sour cherries, which was an excellent imitation of plum pie.

HARRIET BROWN.

Ayer's Pills

Restore tone and strength to the Stomach and Liver enfeebled by disease, promote the Appetite, and cause the Bowels to move naturally. Ayer's Pills are safe to take, do not debilitate by excessive stimulation, and are not irritating in their action.

I have used Ayer's Pills for twenty years, and can truly say they have always given me satisfaction. Whenever I am troubled with Constipation, or suffer from Loss of Appetite, Ayer's Pills quickly set me right again.—P. N. Ward, Bath, Me.

Ayer's Pills have been my family medicine for fifteen years, and the result of that long experience is a complete vindication of your statements concerning them.—T. T. Nunney, West Point, Tex.

Ayer's Pills,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists and Dealers in Medicine.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

HIRES' IMPROVED ROOT BEER. Packages, 25 cts. Makes 5 gallons of a delicious, sparkling and wholesome beverage. Sold by all druggists, or sent by mail on receipt of 25 cents. C. E. HIRES, 48 N. Delaware Ave., Philadelphia, Pa.

FARMERS,

Send for Circulars and Price List of The BARNES PAT. IRON FENCE, the cheapest and most durable fence in the world. Address THE BARNES PAT. IRON FENCE CO., EASTON, PA.

Brewster's Patent Rein Holder.

Your lines are where you put them—not under horses' feet. One agent sold 12 doz. in five days; one dealer sold six doz. in 15 days. Samples worth $1.50 FREE. Write for terms.

E. E. BREWSTER, Holly, Mich.

DYSPEPSIA.

My remedy sent free, the result of actual experience with Dyspepsia. JOHN H. McALVIN, Lowell, Mass. 14 years Tax Collector.

PURE MILK.

WARREN MILK BOTTLES

Patented March 22d, 1880.

Adapted for the Delivery of Milk in all Cities and Towns.

A Long Needed Want at last Supplied.

DESCRIPTIVE CIRCULARS ON APPLICATION.

A. V. WHITEMAN, R. N., 72 Murray Street, NEW YORK.

HUMPHREYS'

Homeopathic Veterinary Specifics for HORSES, CATTLE, SHEEP, DOGS, HOGS, POULTRY.

Used by U. S. Governm't.

Chart on Rollers, and Book Sent Free.

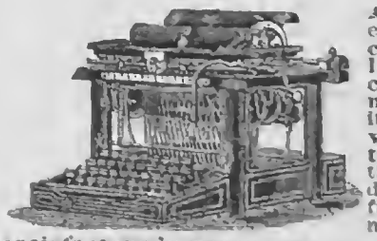
Humphreys' Med. Co., 109 Fulton St., N. Y.

HUMPHREYS' HOMEOPATHIC SPECIFIC No. 28

In use 30 years. The only successful remedy for **Nervous Debility, Vital Weakness,** and Prostration, from over-work or other causes. $1 per vial, or 5 vials and large vial powder, for $5. SOLD BY DRUGGISTS, or sent postpaid on receipt of price.—Humphreys' Medicine Co., 109 Fulton St., N. Y.

REMINGTON

Standard Typewriter.



Attention is called to the **increased excellence** of this **incomparable machine.** Buy it, with the **privilege of returning** it at any time within thirty days, C.O.D. for full price paid, if not **absolutely satisfactory in every respect.**

News of the Week.

HOME NEWS.

SATURDAY, July 10, 1886.

THE Chicago Aldermen, Wednesday night, at 12.30, granted to the Philadelphia ex-convict and present millionaire, C. T. Yerkes, and his street railway syndicate, the use of the La Salle Street tunnel under the Chicago River, for $20,000 a year, less the cost of lighting and repairing it—about $10,000 a year. Votes: yeas, 23; nays, 11. All agree the "privilege" is worth many times the price, and all agree that the consenting Aldermen must have been heavily bribed. In every large city in the Union, the Board of Aldermen is a nest of tricksters, rum-sellers, bribe-takers, black-mailers, and disreputable political petty hacks, with a few—very few—honorable exceptions. Why should this crude form of municipal government, which originated in the Dark Ages, be permitted any longer to disgrace and injure the cities of the 19th century? However suitable to old times and conditions, it is utterly unsuitable to these days. Every year enough gross aldermanic scandals become public in every large town and city in the Union to justify the abolition of this form of municipal misgovernment..... ..... The National debt has been reduced $96,000,000 during the past year—one-third more than in any former year. Isn't the present generation paying a trifle too much to leave the next free from debt contracted for the benefit of it and its successors, and which they, with larger resources, will be better able to pay? As we have spent so much blood and money, why shouldn't they spend some money for the safety of the nation? ....The "Mitchell ring" in Oregon in the late elections knifed Republican Judge Waldo (who sought re-election to the Supreme Court,) because his decisions in land cases were against Hipple-Mitchell's friends, the railroads and other land grabbers.....The River and Harbor bill has grown so large by log-rolling that it is thought certain the President will veto it..... ....Thursday the Senate passed a bill to establish a forest reservation on the head-waters of the Missouri River. It sets aside a large tract of the public domain in Montana for the preservation of the natural forests about the head-waters of the Missouri and Columbia Rivers and their tributaries, and makes it unlawful for any person to enter the reservation for the object of cutting timber, settling or any other private purpose, except as a visitor. .....Judge Love, of the U. S. Circuit Court at Keokuk, Ia., has decided that where a person has invested money in a saloon when it was lawful to sell liquor, the property cannot afterwards be taken from him or rendered useless without compensation on the passage of a Prohibition law. Judge Brewer, some time ago, rendered a similar decision in Kansas, in the case of a brewery.....In trying Anarchists and boycotters, it has been found mighty hard to get a jury in Chicago, Milwaukee or New York. People seem afraid that either themselves or their business will be injured by the sympathizers with the accused, should a verdict of guilty be returned. The prisoners' friends are everywhere and always loud in their threats against judge, prosecuting officers and jury. Three Milwaukee "Raw Reds" have been convicted, however, and two sets of "boycotters" have been convicted and sentenced in New York. The first set of six musicians, convicted of having extorted $1,000 "for the expenses of a boycott" which they had agreed to raise on securing the above sum and all their other demands, were imprisoned from one to two years and ten months each: the other lot of seven Bohemian bakers, ringleaders of boycotters who burst up a fellow-countrywoman's bakers' shop, were sentenced to from 10 to 30 days' imprisonment. A jury hasn't yet been obtained for the Chicago Anarchists. There's a stern resolution everywhere to put an end to all illegal violence and boycotting on the part of strikers.....To July 1, 1,755 miles of new railroad were laid in the U. S., and it is thought from 5,000 to 6,000 miles will be laid during the year, which would be more than in '85 or '84. Think of the new engines, cars, stations, settlements, townships, farms, etc., etc., implied by the construction of every 1,000 miles of new road!.... Chicago's population, as indicated by the new directory, is 750,000—50,000 more than a year ago. Hurry up your new directory, St. Louis!.....The tonnage over the New York State canals in the last two months has been some 318,521 tons greater than during the same period last year. This increase was mainly in wheat and iron ore, and is remarkable because it came during the labor disturbances.....At Coulterville, Ill., Monday, 70 picnickers were poisoned by ice-cream. Four dead already; others seriously sick.....Nothing found out yet about that N. J. poisoning. A butcher accused, but he seems able to prove that he could not have been the poisoner.....The mixing building of the Atlantic Company's dynamite works at McCainesville, N. J., blew up the other morning with terrific force, killing 10 workmen and shattering the building. The bodies of the victims were blown into pieces so small that no distinguishable remnants could be found..... ....The workers in glass and iron at Pittsburg, Pa., (the two greatest industries of the city) and their employers have had more trouble than has occurred in any other line of business in the country—coal mining excepted. They have just come to a probably permanently friendly understanding, however, and their example is expected to be followed by other quarreling parties. The glass-workers of this country and Canada, however, propose to start six co-operative workshops on capital subscribed by workers—$30,000 are expected to be enough to start each shop. They intend to make all kinds of glass-ware, sell the goods at market rates and divide the profits among the stock-holders—mostly operatives. A large meeting of the trade is to be soon held in Canada to arrange matters.....Since Postmaster-General Vilas discharged those railroad postal clerks for combining to strike, most of the others are on the "anxious seat;" 103 of them placed their resignations in the hands of the Executive Committee to be sent in in case of any more discharges, and now they are trying their best to get them back. That "Union" is likely to be short-lived.....The largest Convention of Prohibition delegates ever assembled in Minn., met at St. Paul Wednesday, and nominated a full Prohibition ticket—platform the usual Prohibition article. ..In the State Convention of the Iowa Democrats, held at DesMoines the other day, resolutions were adopted favoring local option, and for the enforcement of prohibition where it was so ordered. Should the sentiment of a community be the other way, a license system was favored, the minimum fee to be $500. ....The Pennsylvania Republicans, in convention assembled, pledged themselves the other day to give the people at next election an opportunity to vote on a prohibitory amendment to the State Constitution..... The Republicans of Ohio seem determined to force Congressional inquiry into the Payne bribery case. They say $250,000 were needed to secure the election of the Great Standard Oil Monopolist to the Senate. Of course, he knew nothing about it—but his friends are likely to have known something.....Atlanta, Ga., has been a "dry" city since July 1; no liquor store open except a very few whose licenes have not yet run out; but no liquor must be sold in smaller quantities than one quart.. Fitz John Porter has been restored to the rank of Colonel in the regular army; the same he held when cashiered in 1862..... ....Chicago switchmen strikers still obdurate; but no longer violent. Railroads running and moving freight without them by the aid of "scabs" from other places.....Academy of Music and Rocky Mountain News buildings at Denver, Colorado, cremated—loss $150,000. .... The losses by fire in June, according to the New York Commercial Bulletin, aggregated nearly $10,000,000; while the average for many years past has been only $6,500,000. Numerous fires in all quarters on the Glorious Fourth, which was gloriously celebrated everywhere.....The President has vetoed 26 per cent. of the Senate bills that came to him, and only 8½ per cent. of the House bills—a bill takes its name from the House in which it originated.....The President has vetoed 90 pension bills and allowed 565 more to become law without his signature, under the 10 days' limit, as he had no time to examine them.....The House Ways and Means Committee will report against the Randall tariff bill.....The acts forfeiting the lands granted to the Atlantic and Pacific R. R., and to aid in the construction of a railroad and telegraph line from Missouri and Arkansas to the Pacific coast, and restoring the same for settlement, are now laws..... The total coinage of silver dollars during the fiscal year, ended June 30, was $29,838,905, against $28,528,552 the preceding year. The coinage of subsidiary silver during the past fiscal year was $183,443 against $320,488 the previous year.... ..... The K. of L. of Chicago have decided to expel all Anarchists from their organization. As they will not generally work with non-members, this may be a serious thing for the Anarchists.....The Knights are going heavily into politics this year, especially in the West. They will try their best to defeat the re-election of Governor Rusk, of Wisconsin, for his vigorous action in suppressing the strikes in Milwaukee..... ..

..The Pension Office has issued 81,422 pension certificates in the last 12 months, or 6,721 in excess of the year before—and this with a reduction in the force of 100 clerks. In June, 10,375 certificates were issued, or at the rate of 399 per day. It looks as if the end of the war was yesterday, instead of 21 years ago..... .....The first application in this country of Pasteur's rabbit virus for the prevention of hydrophobia took place Monday in this city at the Carnegie Laboratory, Dr. Valentine Mott operating. Harold Newall, seven years old, son of Dr. J. C. Newall, of Jersey City, was the patient; he was bitten June 24, by a pet dog, which, according to Drs. Newall and Mott, was surely afflicted with rabies. Dr. Newell signed a declaration taking upon himself all the responsibility.....Of the fund raised for the families of the Chicago wounded policemen, $13,000 have been spent for the cure of the wounded, which the city ought surely to have attended to. It is now proposed to give each widow $1,000 and each orphan $200, and invest the remainder for the benefit of the families of two or three others who are likely to die.....Still another Yankee fishing vessel has been seized by the Canadians, and those captured have been fined $400 apiece. The Dominion Government reiterates that it has received no instructions from the Imperial Government, and that it will make no modification in its policy. Not so much talk now about war on our side; but a good deal of grumbling because our Government does not retaliate, as Congress has given it the power to do.....The whole mackerel catch of the New England fleet this year is 5,000 barrels, against 26,000 barrels last year. ..Three reports have been made on the Pan-Electric scandal by the House Committee who investigated it. The smart Republicans got ahead of their slower Democratic fellow-Committee-men, the four uniting in a report which vehemently blames Garland, Harris, Johnston, Atkins, etc., for accepting over $500,000 worth of stock apiece for using their influence to push the concern and get the public to put money in its stock. Garland is especially blamed for bringing a suit in the name of the U. S., against an older rival, the Bell Telephone Co. The claims of the latter are supported; those of the Pan-Electric denounced. Four of the five Democrats on the Committee (the House being Democratic puts a Democratic majority on all committees) cannot see that Garland, etc., have been guilty of any "dishonorable dishonesty;" think the suit was brought justly, and while not supporting the Pan-Electric, charge the Bell Telephone Co. with fraud in procuring its patent, and extortion in working it. The "odd" Democrat agrees with his fellows in exculpating Garland, etc., but not altogether in their views of the telephone controversy..... The Granger roads are bitterly and persistently cutting rates west of Chicago. Here are the old and new rates for the various classes during the past week between Chicago and St. Paul, and the reduction to other competing points is proportionate:

Class.	1st.	2d.	3d.	4th.	4th.
Old rates.....	50c.	35c.	20c.	15c.	12½c.
New rates.....	30	20	15	12½	10

However low a rate a shipper can obtain from any road, the others will meet it..... ....Gen. Gordon's nomination for Governor of Georgia is assured.....Funds for the Parnellite election in the United Kingdom are being forwarded with marvelous generosity. The Rev. D. O'Reilly, of Detroit, Treasurer of the "American" Irish National League, sent over $100,000 within the 10 days ending July 6, and as much more was probably sent by other collectors within the same time..... .. ....The Senate has rejected the nomination of Solicitor-General Goode, who brought the suits against the Bell Telephone patent in the name of the Government ..... More than $63,000,000 were invested in business enterprises in the Southern States during the past six months.....Disastrous timber fires in Minn., Iowa, Michigan and Vermont..... ....The Broadway surface horse-car tracks in this city have finally passed under the control of the receiver appointed to manage the road. Jake Sharpe and the Philadelphia syndicate who have bought the Broadway and Seventh Avenue roads, pay weekly rent for the use of the tracks until the matter is finally decided by the courts.....

FOREIGN NEWS.

SATURDAY, July 10, 1886.

Gladstone and Home Rule are overwhelmingly defeated for the present. At midnight last night, the total number of Unionists elected in the United Kingdom was 319, and of Gladstonians, 210. The Unionists had polled 1,016,281 votes in all, and the Gladstonians, 949,592. At 4 P. M. yesterday, the Conservatives had elected 263 candidates; the Liberal-Unionists, 54; the Gladstonian-Liberals, 133; and the Parnellites, 70; 141 more elections, chiefly in the counties, had yet to take place, or had not been heard from; but there is no possibility of reversing the present results of the election. At the last election, the counties went almost solidly for Gladstone; now the Conservatives are taking nearly all of them. Up to midnight, the Liberals—Gladstonians and Unionists—had a majority of the Commons, and it is very likely they will hold it. Of the 141 elections to be heard from, 14 are certain for the Nationalists in Ireland. Of the remaining 127, the Conservaties must get 71 to give them an independent majority of 2, and it is not believed possible they can get that number. In last Parliament the Nationalists had 86 seats; they are now certain of 87, having gained a seat in Belfast, the head-center of Orangism. To the last House, Ulster sent 17 Parnellites and 16 Conservatives; it now sends 18 Parnellites and 15 Unionists, and the Parnellites came within three votes of carrying off an election in Londonderry. The Liberal Unionists who voted against Gladstone in the last House numbered 94; there are now but 54—and there won't be over 60 at the most. The Conservatives have gained therefore from all branches of the Liberal party except the Parnellites. For a "working majority," any party ought to have, say, 20 majority. In no case can the Conservatives carry on the Government without the aid of the Liberal-Unionists, under Harrington and Chamberlain. How long would these be likely to act with their old foes against their old friends? Gladstone and the Parnellites are in no way cast down. The agitation for Home Rule is to be kept up. Scotland, Wales and Ireland have shown by their votes that they are strongly in favor of it. England must be educated up to the necessity for it, as well as to its justice and expediency. The result of the elections are so unsatisfactory from a party stand-point, that it is generally believed another set must be held within 12 months.... ..Russia has lately been massing troops heavily in Bessarabia, the nearest of her provinces to Turkey. Some of the Imperial Guard, whose presence at the front generally indicates war, have arrived at the capital of the province. Batoum, in Asia Minor, which was wrested from the Turks in 1878, during the late Turko-Russian war, was then declared a "free port" where all nations could land goods without paying duty, and so trade on the best terms with Persia and the other country back of it. The other day the Czar declared it no longer a free port. This is a blow at the treaty of Berlin, which closed the Turko-Russian war. By means of lately built railroads and water transportation on the Caspian, Russian troops can be embarked at Batoum and arrive at Herat, Afghanistan, in 14 days; whereas it would take British four times that period to get there, and Herat on the road to India, is likely to be the next scene of battle between Russia and England. It is generally supposed that Russia's movements of late protend an early war, with Constantinople as the European objective point, while an army will be sent to India to rouse the natives against English rule, and so put England on the defensive at home, and prevent her from aiding Turkey.

AGRICULTURAL NEWS.

SATURDAY, July 10, 1886.

NOTHING has been done this week with the Oleomargarine Bill, contrary to expressed expectations of Congressmen. Congress is likely to adjourn July 20, though some say it cannot do so before the end of another week. The general impression is that the bill will be passed in some shape. If it isn't passed in a satisfactory form, farmers ought to hold their Senators and Representatives to a strict accountability..... A load of hay was being driven into the big barn of Schuyler Parish, of Naples, N. Y., the other day, when an iron bolt of the rack pressed so hard on a wheel, the tire struck fire and the hay was ignited. The driver had the presence of mind to back the load out of the barn and jump down. Then the frightened team ran through the village with the blazing load, setting fire to a bridge on the way. When they were stopped all of the wagon had been burned but the front wheels..... ..The Central Kansas Live-Stock Association; at a meeting at Emporia, the other day, opposed the Oleomargarine Bill, and requested the Senators from Kansas to use their influence to defeat the measure. It also favored the manufacture and sale of bogus butter. It has no interest in dairying, and thinks its cattle may be worth a trifle more per head, if their fat can be converted into "butter."..... ....The famous Hereford bull, "Lord Wilton," which died recently, won over $100,000 in prizes during his life.....Dakota fines a farmer who fails to destroy Canada Thistles, cockles and other noxious weed on his land. .....Owing to the greater profit in cross-bred sheep for market, and the competition of coarser but cheaper Australian wools, German flock owners are abandoning the production of the finest wool, for which they were famous.....The rise in Australian wools at the London sales is thought a great thing for the colonists, with many of whom even a rise of a cent or two a pound on their product makes all the difference between solvency and ruin.... ...It is now thought the shortage in our clip will not be less than 15,000,000 pounds.....Agricultural Com. Colman praises himself highly in his own St. Louis paper for ignoring the question of the proposed tariff on wool entirely. Colman is a Democrat; the bulk of the party favor free

trade. To go against his party might help the farmers, but it would also be likely to imperil his hold on his office..... ..Foreign markets, over-stocked with American cattle, are dull..... Inoculation for pleuro-pneumonia, on the Pasteur principle (that of attenuated virus) is being tried in England. In a single herd, 74 cattle were recently inoculated for this purpose.....The exports of live stock and dressed meats per steamships from the port of Boston for the foreign markets last week, were 1,103 cattle and 2,484 quarters of beef..... ....The Bureau of Animal Industry thinks that Colorado is over-stocked with cattle, that Wyoming can bear no more, but that there is still room for a considerable increase in Montana.....Major Alvord, late superintendent of Mr. Lawson Valentine's agricultural experiment farm, known as Houghton Farm, Mountainville, Orange Co., N. Y., has accepted the position of Professor of Agriculture at the State Agricultural College, Amherst, Mass.....

Crops & Markets.

SATURDAY, July 10, 1886.

THE Mark Lane Express says "the brilliant and unbroken summer weather" is "improving surviving crops;" trade still favors buyers; but price of wheat is only 97¼ cents per bushel, against $1,13 a year ago.

Late cablegrams report the crop outlook in the United Kingdom, France and India much less favorable than anticipated. Hence prices of wheat have been moving slowly but steadily upward in England, having advanced 1½c. a bushel wit in the last week. There has also been an upward movement in France, Austria-Hungary and Germany.

The past week has been torrid in nearly all parts of the country; but in the Northwest the early part of it was blazing, the thermometer registering all the way from 100 to 120 degrees! Most parts of Dakota and Minnesota were visited by a burning, sirocco Wednesday, the heat being the greatest ever known in that section. With the exception of a few local showers, the drought has lasted through the Northwest since early in June, and great damage has been done to small grains. Winter wheat has been seriously injured; oats have been cut short to a great extent; barley has been somewhat damaged; and grass and hay have suffered severely. The injury to crops is variously estimated at from 10 to 50 per cent.—probably 15 to 20 per cent. will turn out near the reality. In June, 1881, there wasn't a drop of rain from June 1 till harvest, and the injury to wheat was less than 15 per cent.; this year there were light rains nearly everywhere, and this morning's telegrams promise heavier rains to-day or to-morrow, so that the present prognostications of damage are likely to prove exaggerated. Oats are likely to suffer more heavily than wheat; the yield in Minnesota is not expected to be more than half that of last year. In parts of Wisconsin the crop is nearly a failure. In Iowa it is below the average. Flax is promising.

While the farmers of the Northwest have been suffering from drought, those of Georgia and the surrounding States have been suffering severely from the terrific rains which have fallen almost daily for three weeks or more. In many sections the watermelon and cantaloupe crops, from which so much has been expected, have been well-nigh ruined. Cotton, under the influence of the excessive moisture, has run largely to weeds and is in poor condition to withstand the July sun. Fields that should now be clean and well cultivated are full of grass, and resemble so many pastures, and the fertilizers, it is feared, have been swept away.

Since the alarming reports of the threatened destruction of the New York hop crop by lice and "honeydew" and serious reports of injury by drought elsewhere, the price of old hops has been going up rapidly. Thursday, however, consumers made a stand against a further advance in prices, at least there was a pause in the upward movement. Less credit has been given to the disastrous reports here than in the country, so that prices have often been higher in the hop-growing regions than in this city. About the middle of May last, State hops were quoted here at nine to 10 cents per pound, while sales were made at Waterville, the head-center of the New York hop section, at five to eight cents. About the middle of June reports of lice on the vines began to be considerably discussed, with the effect of stiffening holders and leading to offers of 11 cents at Waterville. On the 21st a Syracuse grower telegraphed: "Parties here offering 10 cents. My yards are past all recovery." Quotations in this market had meanwhile advanced to 11 and 12 cents per pound for State. By the 1st of July holders were asking 15 cents Wednesday last the advance had reached 20 cents, with one-half cent more paid at Waterville. Thursday, as already stated, the market remained in *statu quo*, with holders firm and confident. The following shows the range of prices for hops in New York during the month of July (average for the month) in a series of years mentioned:

	State. Per pound.	California. Per pound.
July, 1878	7 @12	10 @12
July, 1879	7 @12	8 @11
July, 1880	25½ @33⅝	28½@33¾
July, 1881	12 @23	19 @23
July, 1882	34⅛ @13 3-16	— @—
July, 1883	28½ @31	28 @ 31½
July, 1884	28 1-16@32¼	28¾@29½
July, 1885	9 5-16@11¾	5⅞@ 9⅞

The range of prices for State hops in December, 1882, was 89 15-16 cents to $1.02 per pound, and the average continued high all the Winter and Spring, until with the new crop in sight there was a drop from 47 to 55 cents as the range in June, to 28½ to 34 as that of July, 25½ to 30 in August, 23 to 27½ in September, not falling below 20 during the remainder of the year. There seems, therefore to be plenty of room for further advance before anything like the high prices of recent years is again reached.

During the week there has been a regular "boom" in the price of wheat, due to the conceded serious nature of the injury to the spring crop by the scorching weather in the Northwest, reports of unexpected shortness in Europe and India, and a decrease of 1,288,000 bushels in the visible supply. At Duluth, the highest price was reached on Wednesday, when August wheat sold at 85⅝. On Thursday it closed at 81¼ against 78¼ a week ago. In Chicago the excitement began Tuesday, and the wheat pit was wild on Wednesday. The advance in two days amounted to 4½ cents per bushel. Here the advance in No 2 Red, spot, was 1⅝ cent from June 25 to July 2, and 1 cent from last Friday till last night. Other grades went higher. All markets shared in the fluctuations. Yesterday there was a downward movement; but this morning, prices were again moving upward.

It is estimated by Bradstreet's that stocks of wheat in the United States and Canada were reduced 28, 151, 181 bushels in the quarter ending June 30, against a reduction of 5, 377, 735 bushels in the same part of 1885. The stock on hand now is placed at 35, 312, 653 bushels, against 48, 196, 667 bushels July 1st, 1885.

Indian corn has been active and excited in sympathy with wheat and on account of reports of injury by drought. It is generally thought, however, that it will be able to take care of itself if it gets a good rain within the next ten days. The visible supply fell away 269,000 bushels, which helped to stiffen figures.

Oats went up with the others; the visible supply declined 260,000 bushels.

Hogs are higher and cattle lower than at this time last year. Prices of hogs are considered good for summer packing.

Butter has advanced a little, as receipts have fallen off somewhat, owing to torrid weather. Export trade active, and better than last year. Firm feeling among holders of cheese.

In the interior most of the wool clip has already passed out of the hands of growers, at very full prices as a rule. Dealers, manufacturers and speculators have cleared up nearly all the clip even in the Territories. In Montana 20 cents per pound have been readily paid for wool that wouldn't bring over 17 to 18 cents last year. Prices in Europe have been very firm and advanced a little at the Colonial sales. It is generally felt that a new basis of value has been established. At Boston sales have been very heavy between dealers, and manufacturers have also bought heavily. There has been a further advance of one to two cents per pound. Demand continues to run decidedly to medium and low sorts, as there are no indications of a change in fashions, which would affect the selection of grades. Prices there for leading sorts compare as follows with two months and one year ago:

	July 9, '86.	*May* 7.	*July* 10, '85

Syracuse, N. Y.

For the Young.

TWO SONGS.

A WOMAN sang before a breathless crowd,
Her voice swept like an angel's anthem past.
A thousand voices shouted long and loud
In wild applause when hushed the song at last.

She sang again: beside her baby's bed
A simple tender lullaby—and low,
Till slowly drooped the dainty, golden head
To dreamland on the music's gentle flow.

None heard her save the dreaming babe alone.
There came no shouting voice, no wild recall,
And yet the angels listening at the throne,
Smiled at the song, and called it best of all.

THE weather is hot. Last week there were several "roasters." People went about with their hats off, mopping their heads with their handkerchiefs. The poor people in the lower parts of the city suffer greatly this hot weather. They are crowded into close rooms, where there is hardly a breath of air stirring. The sun just bakes the bricks and iron all day long, and at night enough heat is left to make the rooms like ovens. Think of little children being brought up in ovens! About the coolest place these poor people can find is far up on the Brooklyn Bridge. There is always a cool breeze there. Lots of people go there in the evening to get a mouthful of fresh air. Far up over the city, out of the noise and dust, they can get a little rest.

Thousands of city people went out to the country to spend the Fourth. I saw crowds of them at the stations and on the trains. They were excited enough. It was good for them to get a chance to run about a little. They came back Tuesday with lame joints and noses and hands as red as roses. Thoughtless city folks are apt to say that country people are awkward and behind the times. If they could only see themselves as they appear in the country, they would have nothing more to say. They are often ridiculous in their manners and talk, and the funny part of it is that they think all the time they are making people think they are regular farmers. It pays to be natural. Don't try to be something that you are not. You will deceive nobody and only make yourself ridiculous.

Take care of yourself this hot weather. Don't drink too much cold water while you are heated. The proper way to drink ice-water is to swallow it slowly. Pouring it down the throat as we would pour it into a jug is a kind of intemperance that I oppose. Bathe just as often as you can, but don't jump into cold water while your body is like a furnace. If you go in swimming wet your head at once. Don't sit on the bank in the sun with your hat off. It is a good plan to "duck under" as soon as you get into the water. Put some leaves into your hat while you are working in the harvest field, and pour water on your wrists. Don't eat too much meat this weather.

THE horses on the horse cars have a hard time in these baking days. There is very little shade for them and the sun scorches the pavements. They are glad enough when they get around to the end of the trip where they can get water. I saw one the other day at the watering trough, and those who think a horse can't talk and reason ought to have seen him. The driver sponged the horse's head off with cold water and rubbed his shoulders and legs with a damp cloth. It was worth a dinner to see how the horse enjoyed his bath. He rubbed his damp head against the driver's shoulder, with as plain a "thank you" as I ever saw. When he started off again he went as though he had determined to pay in extra work for his treat. How foolish some people are in supposing that horses do not appreciate good treatment. They do, and they pay for it too.

I begin to think that raspberries are about the best of all small fruits. I like them better than I do strawberries, and I feel sorry enough for any family that has to go without them. A great deal has been said about people who have no fruit, but I don't think we can say too much. When we have farms of our own, we will have fruit enough. Let there be a raspberry patch by all means.

I suppose the girls are going to have lots of canned fruits for next Winter. That's right. I would like to see the cellars well lined with jars of preserves. I would like to call around and help eat them too. Home-made food is so much nicer than that we get at the stores, that it always seemed to me that the "women folks" must feel themselves well paid for their trouble when they see how glad the "men folks" are to eat the food. I have no place for men or boys who never say that their food tastes good. I like to see them get up from a hearty meal and say, "I liked that; it was good." It don't hurt them any to say so, and it does the "women folks" lots of good. Whenever I see a boy who insists that his mother is the best cook in the world, I know that boy will never run away from home, and that he will be apt to make a strong, good man. I want all our girls to make first class cooks. The more good food we have in the country, the better off we shall be. When the boys have good food I want them to admit it, and praise the cooking. You had better show this to father, too. He may not think so much of what I say, but it won't do him any harm to think about it.

Many farmers do their work by the "signs." Sometimes it is a black cat, or the way a rooster crows, or the way the dog barks, that tells them what is going to happen. Such signs are very ridiculous. Cats and dogs never know what is going to happen to us, and the man who thinks they do, shows that he has neglected his mind. There are certain signs about the crops, though, that are pretty sure. Crops generally grow in about the same way every year. By watching them carefully you can tell pretty nearly how they will come out. Watch the potatoes. If the ground is cracked over the hills, just as if the growth had split the surface, you may safely make up your mind that there will be a fine yield. Look out that the crack is not made by a mole, though.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

BEAR CREEK, as I had been given to understand, was some five miles from the little town of Newbank. We changed cars at 12 o'clock at night, and I spent the tedious wait in walking about the little station, mentally reviewing my studies preparatory to passing that dreaded examination. It seemed strange, but the more I thought of the probable questions, the more they seemed to mix in my head; yet I foolishly went on reviewing and repeating my knowledge to myself. This work never pays. It is better to drop all thought of the examination, so that the mind may be fresh when the trial comes.

The station agent was a gruff man, with a grizzled beard and a shabby coat. He glared at me from his little window as I paced up and down the room. I never knew what he had against me; perhaps some thoughtless college boy had played a trick on him. He came out of his office at last and spoke to me.

"Yer frum the college, aint ye?"

I nodded.

"Gonter teach deestrict school, I 'spose?"

"Yes, sir."

"Well, I hope they'll throw ye out. Ye hear? I hope they'll pound the sand with ye. I'd like fer ter live in the deestrict where I cud help dog ye. I dun'no who ye be, but I jedge ye by yer class. You fellers set up thar to that college jest like bumps on a log, an' we farmers support ye. Then ye come out to show them that's raised ye how to farm it. I was puttin' in some tile onct, an' thar come along a book-agent. He done his best to sell me a book I didn't want at all, an' when he found he couldn't do nothin', he turns round and says, 'Why don't ye put that tile in right? That aint the way we does it up to the Agricultural College, by no means.' I sez, sez I: 'I owns that tile, an' I puts it in ter suit me. When ye git over yer smartness enough ter own somethin' of yer own, ye kin work yer own rules.' I want all these smart fellers ter git ketched up, an' they aint no better place fer it than a good rough deestrict school; an' I hope ye'll git it."

We should have had a long argument, I am certain, if the train had not carried me out of reach of his harsh voice. The last words I remember hearing him say were: "I hope they'll mop the floor with ye, an' dust the starch outer yer jacket." These words repeated themselves over and over in my head, in time with the clanking of the wheels, until I fell asleep.

We reached Newbank in due time. It was a small country town, with one long street leading up from the depot to lose itself at the top of a low hill just back of the town. The stores and offices were arranged along the street, while back of them on either side stretched the dwellings, the spaces and yards about them growing wider and wider as the distance increased, so that the dividing line between town and country was difficult to determine. A saloon stood on the most prominent corner, and gave the town a very bad black eye. The roads were deep with mud that seemed to have climbed up over the steps and platforms into the stores. I found a little hotel about half way up the street, where breakfast was waiting. The landlord was a fat man who had very little to say. He sat in his little office and regarded me with sleepy eyes when I came to pay my bill. In answer to my question as to the distance to Bear Creek, he turned in his chair and silently pointed across the street. Following the direction of his finger, I noted a man leaning against a post in front of the store. A farm wagon with two red horses attached to it stood near by. I waited patiently for the host to explain this gesture, but no explanation was forthcoming. He settled back in his chair and half closed his eyes as though he wanted to go to sleep. Even a compliment to the breakfast I had just eaten, dressed up in the strongest language I could think of, failed to bring out anything but a species of grunt, so I picked my way through the mud of the street, determined to investigate for myself.

The man marked out by the landlord's sleepy gesture regarded me curiously as I scraped the mud off my boots upon the steps of the platform. He was an old man. His head was thrust forward and his shoulders bowed with hard work. A thin tuft of gray hair thrust itself into view from under his chin. His upper lip was covered with a short, gray stubble that seemed to start angrily out to defend his great mouth. I remember thinking how useless this defense was. Nothing worth fighting about would have cared to enter that mouth through the black stumps of teeth that showed through the lips. His eyes were small and cunning. They seemed to be trying all the time to make themselves still smaller. In this effort they had pulled the face into a mass of wrinkles and hard lines, and pushed the nose to one side. I notice that people with small eyes are almost always selfish.

The man wore a torn fur cap, the visor of which, in its frantic efforts to tear itself away, had twisted the whole cap about so that it hung over one ear. An old blue army coat covered the rest of his clothes, with the exception of a pair of great boots which, guiltless of blacking, thrust themselves into view.

(To be continued.)

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I am a boy 13 years of age. I would like to join the Y. H. C., if you will let me. I have four brothers and two sisters. I have been helping on the farm this Spring. My father has been a subscriber for the RURAL NEW-YORKER for over 30 years and is taking it now. My mother is very fond of flowers and has many different kinds. I live on the largest of the Thousand Islands, within three miles of the City of Kingston.

BURWELL J. COOK.

Wolfe Island, Ont.

UNCLE MARK: I have been reading the letters from the Cousins in the RURAL and I enjoyed reading them. I have got the mumps and can't go out doors to play, so I thought I would write a letter. I am 11 years old and live on a farm one mile from the St. Lawrence River. I go fishing in the Summer and sometimes catch a lot of fish. I have one brother and three sisters. We have 33 head of cattle, six horses, 26 pigs and 100 hens. I have a pair of ducks and a dog. Her name is Tip. I love flowers and I help my mother make her garden. I also have a small garden of my own. ERWIN P. ALLEN.

St. Lawrence Co., N. Y.

[I am glad you did not go out and thus make the mumps worse. I hope you are cooler up where you live than we are.—U. M.]

DEAR UNCLE MARK: I am going to try for one of the ten dollar prizes. I will tell the Cousins that are bothered with gophers a good way to catch them. Take a fish line 12 feet long, make a running noose in one end. When you see a gopher go in his hole, put the noose over the hole, then go to the other end and wait till you see him put out his head; give the string a jerk, and you have him. From your loving nephew, JOHN C. THOMPSON.

Ireton, Iowa.

[I fear the gophers are getting lazy. Those I saw years ago were too smart for that.—U. M.]

DEAR UNCLE MARK: I am 16, but I do not go to school. Pa died last January, and my brother and I have the chores to do. We have four cows, three pigs, and two horses; one of them is 26 years old. We have about 80 chickens. I am learning dress-making, and I am making two crazy quilts and a charm quilt. The cars came to Antioch last March for the first time, and they fired the cannon and the band played. How many of the Cousins can make lace? I can crochet some, called the pine-apple. DORA M. BARNARD.

Fox Lake, Ill.

[Dress-making is a good trade. How much more independent we feel with a good trade back of us!—U. M.]

UNCLE MARK: I am a little girl 12 years old. I go to school and study reading, writing, spelling, geography and language. I have only one pet, a canary bird. He is yellow, and sings very prettily; his name is Jimmie Mason. I have over 100 kinds of house plants. I wonder if any of the Cousins can beat that. My Grandma took the RURAL when Mamma was a little girl, and has been taking it ever since, till just a few years ago; since then Papa has been taking it, so I have been with the RURAL all my life. I have one sister, seven years old, whom I love. Last Summer I had some ground and I raised some very pretty flowers. I wash dishes, sweep, cook, and lots of other things. Well, I am afraid you will scold if I make my letter much longer, but there is a question which I would like to ask; it is this. May I join the Y. H. C.? Please don't throw this into the waste basket. I will close for this time, but will write again. ALETTA M. UPSON.

Noble County, Ind.

[Yes, indeed, you may join. What a lot of good housekeepers we have. You are a regular RURAL girl.—U. M.]

DEAR UNCLE MARK: I am one of your girls that does not chew gum. I think it is a filthy habit. I am learning to do all kinds of housework. I can bake pies nicely. I get up almost every morning to get breakfast by six o'clock. Last Winter I had a pet lamb; raised it by hand. I am 10 years old.

Mahoning Co., Ohio. LIZZIE B. LYNN.

[I am glad to know you are not a gum chewer. It is a bad habit.—U. M.]

DEAR UNCLE MARK: I can't say "R" yet, and my Papa said I'd better wait till I did before I'd write any more letters, but I'm 'f'aid you'll forget that little Sallie Palmer D'imes 'longs to the Club. I'm a big girl now; I am four years old. I'm going to help in Mamma's garden this year, for we are going to have "our house" and I'm going to raise a great deal, because Too Too is not but two years old, and she's so fat, and little Benjie can just sit up on the floor. My little hoe got broke, but I hope my Papa will mend it, and not say again that it had better stay broke, for I need it to make a good crop.

Your little niece,

SALLIE PALMER GRIMES.

DEAR UNCLE MARK: Would you like to hear from a little boy from Easton? I am eight years old, and have not started to school yet, but I can read in the second reader, and you can see how I write in this letter. We live two miles from town, on 118 acres of land. There is a large apple orchard on the farm. Papa has three-quarters of an acre of strawberries, and raised 100 bushels off of it last year. My brother raises peanuts. I have a little garden. Last year I raised a citron that weighed 15 pounds. I am going to try and raise a larger one this year. Papa is going to build a house and barn this Summer.

Yours truly,

Talbot Co., Md. RALPH E. SWARTZ.

DEAR UNCLE MARK.: We have five horses and two colts, three pigs, 20 cows and one calf. We own a farm of 98 acres. We live one mile from the main street. Pa sells milk in the village. I like to live on a farm, for then I can run in the woods and gather wild flowers and catch fish in the creeks. We have lots of black walnuts and butter-nuts and hickory-nuts. I do not go to school now, so that I have lots of fun. We have lots of chickens, so that we sell eggs.

We have a big black dog named Jack. I am 11 years old, and I would like to be a Cousin too. J. G. CAMPBELL.

Dansville, N. Y.

DEAR UNCLE MARK: My Papa has taken the RURAL ever since I can remember. I would like to join your Club and be one of the Cousins. I am a girl eight years old and have two sisters, Lizzie and Alice. I enjoy reading the children's letters. We have 11 pigs, one hog, four horses, 40 cows, 23 hens, one dog, two cats, and I have one Bantam, (and she has four chickens), nine calves and 48 hives of bees. If you would come here and see us I would give you all the honey you could eat. Yours truly,

Edmeston, N. Y. CHARLOTTE DENISON.

[I shall remember your promise when I come near you.—U. M.]

Miscellaneous Advertising.

Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

100 Doses One Dollar

PERSONALS.

THE Grand Duke Nicholas, of Russia, is an enthusiastic entomologist, and has lately been butterfly-hunting in the Himalayas.

LOUISE MICHEL, ex-leader of the French Anarchists, says she hopes to come to America after death, when her soul migrates.

DAVID M. OSBORNE, head of the Mower and Reaper M'f'g Company, at Auburn, N. Y., and ex-mayor of the city, died there, Tuesday, of heart disease, aged 64.

IT is generally believed in Washington in official circles that during the Summer, Attorney-General Garland will resign, and that he will be succeeded by ex-Senator McDonald, of Indiana.

HOBART PACHA, late Grand Admiral of the Turkish fleet, and third son of an English earl, died in the arms of his wife, a young English lady only 27 years old. One of his dying requests was that he might be interred in Turkish soil.

BISHOP SPAULDING, of Peoria, is said to be the dean chosen for the new Catholic University at Washington; he is a Sulpician, and so is Cardinal Gibbons, and it is thought the Sulpician influence will outweigh the Jesuit in the University.

IT is said that Dr. Schweninger, Bismarck's physician, who was recently called to St. Petersburg, was promised by the Czar a large sum only on condition of his succeeding in his proposed treatment. If he fails to effect a permanent reduction in the Czar's weight, his own pay is to be materially reduced.

BEING asked in St. Louis to prognosticate the Republican Presidential ticket of 1888, John A. Logan responded: "I don't know, but you can say positively that I'm not a candidate for a place on the ticket. I'm not a a candidate for anything just now. I think the people will decide between now and then who will be the candidate."

"BUCK" GRANT was interviewed by a Denver reporter the other day and asked how he came by the nickname. The explanation was simple. When the Grant family moved from Ohio to Missouri he was a little boy, and some one called him in joke, "The Little Buckeye." The name stuck, but in the process of time "the little" and "eye" were dropped, and the name as it now stands remained.

ONLY three States west of the Mississippi—Missouri, Iowa and Minnesota—can claim Senators as their sons. Fourteen of the 72 were born in New England, five of them in the Old Bay State; while New York is credited with eight, Ohio and Virginia with six each, and Pennsylvania with five. Beck was born in Scotland, Jones, of Nevada, in Wales, Fair, Sewell and Jones, of Florida, in Ireland.

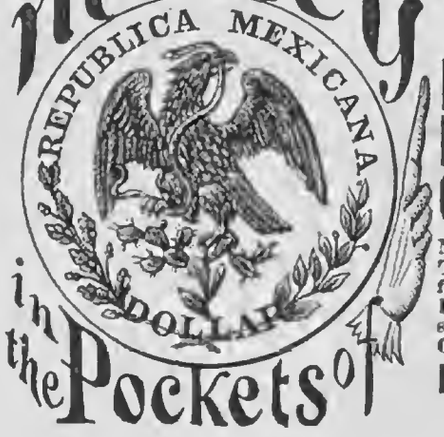
THE Hon. G. B. Corkhill, who as District Attorney at Washington, conducted the prosecution of Charles J. Gauteau, died of hemorrhage of the stomach last Tuesday (July 7), at Mt. Pleasant, Ia., whither he had gone to make political speeches in the district. Born in 1840, in Ohio; removed to Mt. Pleasant, Ia., when young; became a lawyer there; went to Washington in 1873, and divided his time between practicing law and editing.

GEN. S. H. HURST has been appointed Dairy Commissioner of Ohio, and L. N. Bonham has succeeded W. I. Chamberlain as Secretary of the State Board of Agriculture. The latter has left the great Buckeye State where he has "lived and labored for nearly 50 years," to assume the presidency of the Iowa Agricultural College. We heartily wish him success in his new position, confident that few men in the country are so capable of achieving it.

SEVERAL Congressmen who do not wish to use their positions to feather their own nests, do not want a re-election. Representative Collins, of Mass., is one, Martin Foran and Ben. Le Fevre, of Ohio, cannot afford to work in Congress for $5,000 a year each, when the former can make $10,000 a year at the bar, and the latter as much or more as Vice President of a railroad. Louttit, of California, wouldn't live East for the honor of being a Congressman, and will never step outside the Golden State again. But, bless you, most of 'em make the Congressional business pay better than any other they would get.

RECENT revelations leave no doubt whatever that the late King of Bavaria was outragiously insane. Among other things, for a whole year he made his valet wear a black mask as a punishment for some imaginary offence. Another servant was compelled to go about with a black mark on his forehead, to indicate that his brain was out of order. On one occasion the poor Bedlamite declared war against the King of Saxony, and professors of chemistry were sent for from Munich to transform one of the Hohenschwangau Mountains into a volcano. Of his lunatic vagaries there was no end.

It is money in the Pockets of FARMERS.



TO MAKE FERTILIZERS AT HOME with

POWELL'S PREPARED CHEMICALS | FOR $12.00 You can obtain A TON of SUPERIOR PHOSPHATE

NO TROUBLE. Any boy, in ONE HOUR, can mix a TON ready for use. Intelligent, prosperous and leading farmers in every State as references. CHEAP, GOOD and PURE. Fully two-thirds of the usual Fertilizer bill can be saved by using POWELL'S PREPARED CHEMICALS. ☞A book giving full information, mailed Free.

The Latest Improvement IN Traction Engines.

The only Engines where the power is practically and successfully applied to the four truck wheels. Exceeds all other Traction Engines in pulling and steering through mud holes, sand, or any soft or uneven ground, or on any road. Is the result accumulated from a third of a century of study and practical experience in the manufacture of

PORTABLE,
Agricultural & Stationary Steam Engines.

With determined policy to build only the BEST MACHINERY from the BEST MATERIALS, and in the BEST MANNER OF CONSTRUCTION, and with continued improvements, have attained the HIGHEST STANDARD in excellence of workmanship, simplicity of design, and capacity of power.

In addition to our STANDARD ENGINES we now offer the first ROAD ENGINE which has the Traction Power practically and efficiently applied to the four truck wheels, and while so applied to each wheel independently, the forward axle is under full control of the steering apparatus.

Descriptive catalogue will be sent on application.

Humorous.

It's the littles that tell—especially the little brothers and sisters.

A LITTLE boy came to his mother recently and said: "Mamma, I should think that if I was made of dust I would get muddy inside when I drink."

THE venerable Hopkins has been connected with Williams College for 66 years, and yet he cannot sign his name without making his Mark.—*Lowell Courier.*

HUSBAND—"That fence wants painting badly. I think I'll do it myself." Wife—"Yes, do it yourself if you think it wants to be done badly."—*Texas Siftings.*

NOW that the excitement attending the President's marriage has somewhat subsided, let us return to the discussion of the question: "What sunk the Oregon?"—*New Haven News.*

"WHY, Allie dear, is that the way to begin your dinner?" asked a mother of her little daughter, as she began with the pie. "Well, I declare, Mamma, I was going to eat my dinner upside down wasn't I?"—*Farm Journal.*

HUSBAND (impatiently to wife)—"I told you I only wanted half a cup of tea, and, as usual, you've filled it to the top. Don't you know what half full is?" Mother-in-law (grimly)—"She ought to by this time."—*N. H. Patriot.*

MISS ROSE ELIZABETH CLEVELAND is getting a reputation for bon mots, such as this: A Western visitor remarking in his free-and-easy way, "You hail from Buffalo, I believe?" she replied, "Yes, we hail from Buffalo, but we reign here!"

YOUNG WIFE: "Mr. Poissom, I wish some nice smelts for dinner to-day." Mr. Poissom: "Yes, madame; how many?" Young wife: One will be plenty, for only last week I ordered two salmon and there was a great deal too much.—*Life.*

"WHERE are you going?" said his fond mother to Johnny. "Going in swimming, mother." "Going in swimming! why you silly boy you'll get yourself wringing wet in such a shower as this; wait till the rain is over."—*Farm Journal.*

"MY friend," he said in solemn tones, to the passenger in the seat ahead, "are you a Christian?" "Well, I hope so," replied the passenger, somewhat startled. "Ah! then you have been baptized in the church?" "No, sir; I was baptized in the river. I'm a baptist."—*New York Times.*

A GIRL at Olympia, Oregon, threatens to sue her own father for breach of promise. She says the old gentleman first gave his consent to her marriage with her lover and then withdrew it, and that in consequence her beau got tired of waiting and has gone off with another girl.

A SMOKER presents his open cigar-case to his neighbor on the right. "Thanks, I don't smoke." He then turns to his neighbor on his left. "I don't smoke; much obliged." His wife whispers in his ear: "Are you not going to offer one to the captain?" "No, love; he smokes—I know he does."—*L'Echo Liberal.*

"It is my unalterable decision, Clara," he said, firmly; "I cannot walk on the avenue with you if that poodle is to accompany us. You must choose between him and me. It rests with you, Clara, if our engagement shall be broken off." "Oh, George!" the girl replied, and her face assumed an ashen hue; "this is all so sudden. You must give me time to think it over. One week, George, and you shall have your answer."—*Ingleside.*

A WELL-KNOWN minister was sent South from New Jersey a few years ago to labor among the colored people. They received him with many demonstrations of joy, and at the first meeting which he held one old colored preacher prayed for him with great earnestness, thus: "O Lord! bress dis yer dear brudder what's come down from de Norf to preach the gospil to us. 'Noint him wid de kerosene ile ob salvashin, and set him on fire."

SECOND-HAND INFORMATION.

Indignant Ticket Agent: "I've told you three times already that the next train leaves at six-thirty. Don't bother me any more!"

Inquisitive Passenger: "Shure, sor, it's not fur meself oi'm axin' this toime; it's fur a lady outsoide, sor."

The Herdsman.

SWISS COWS.

HENRY STEWART.

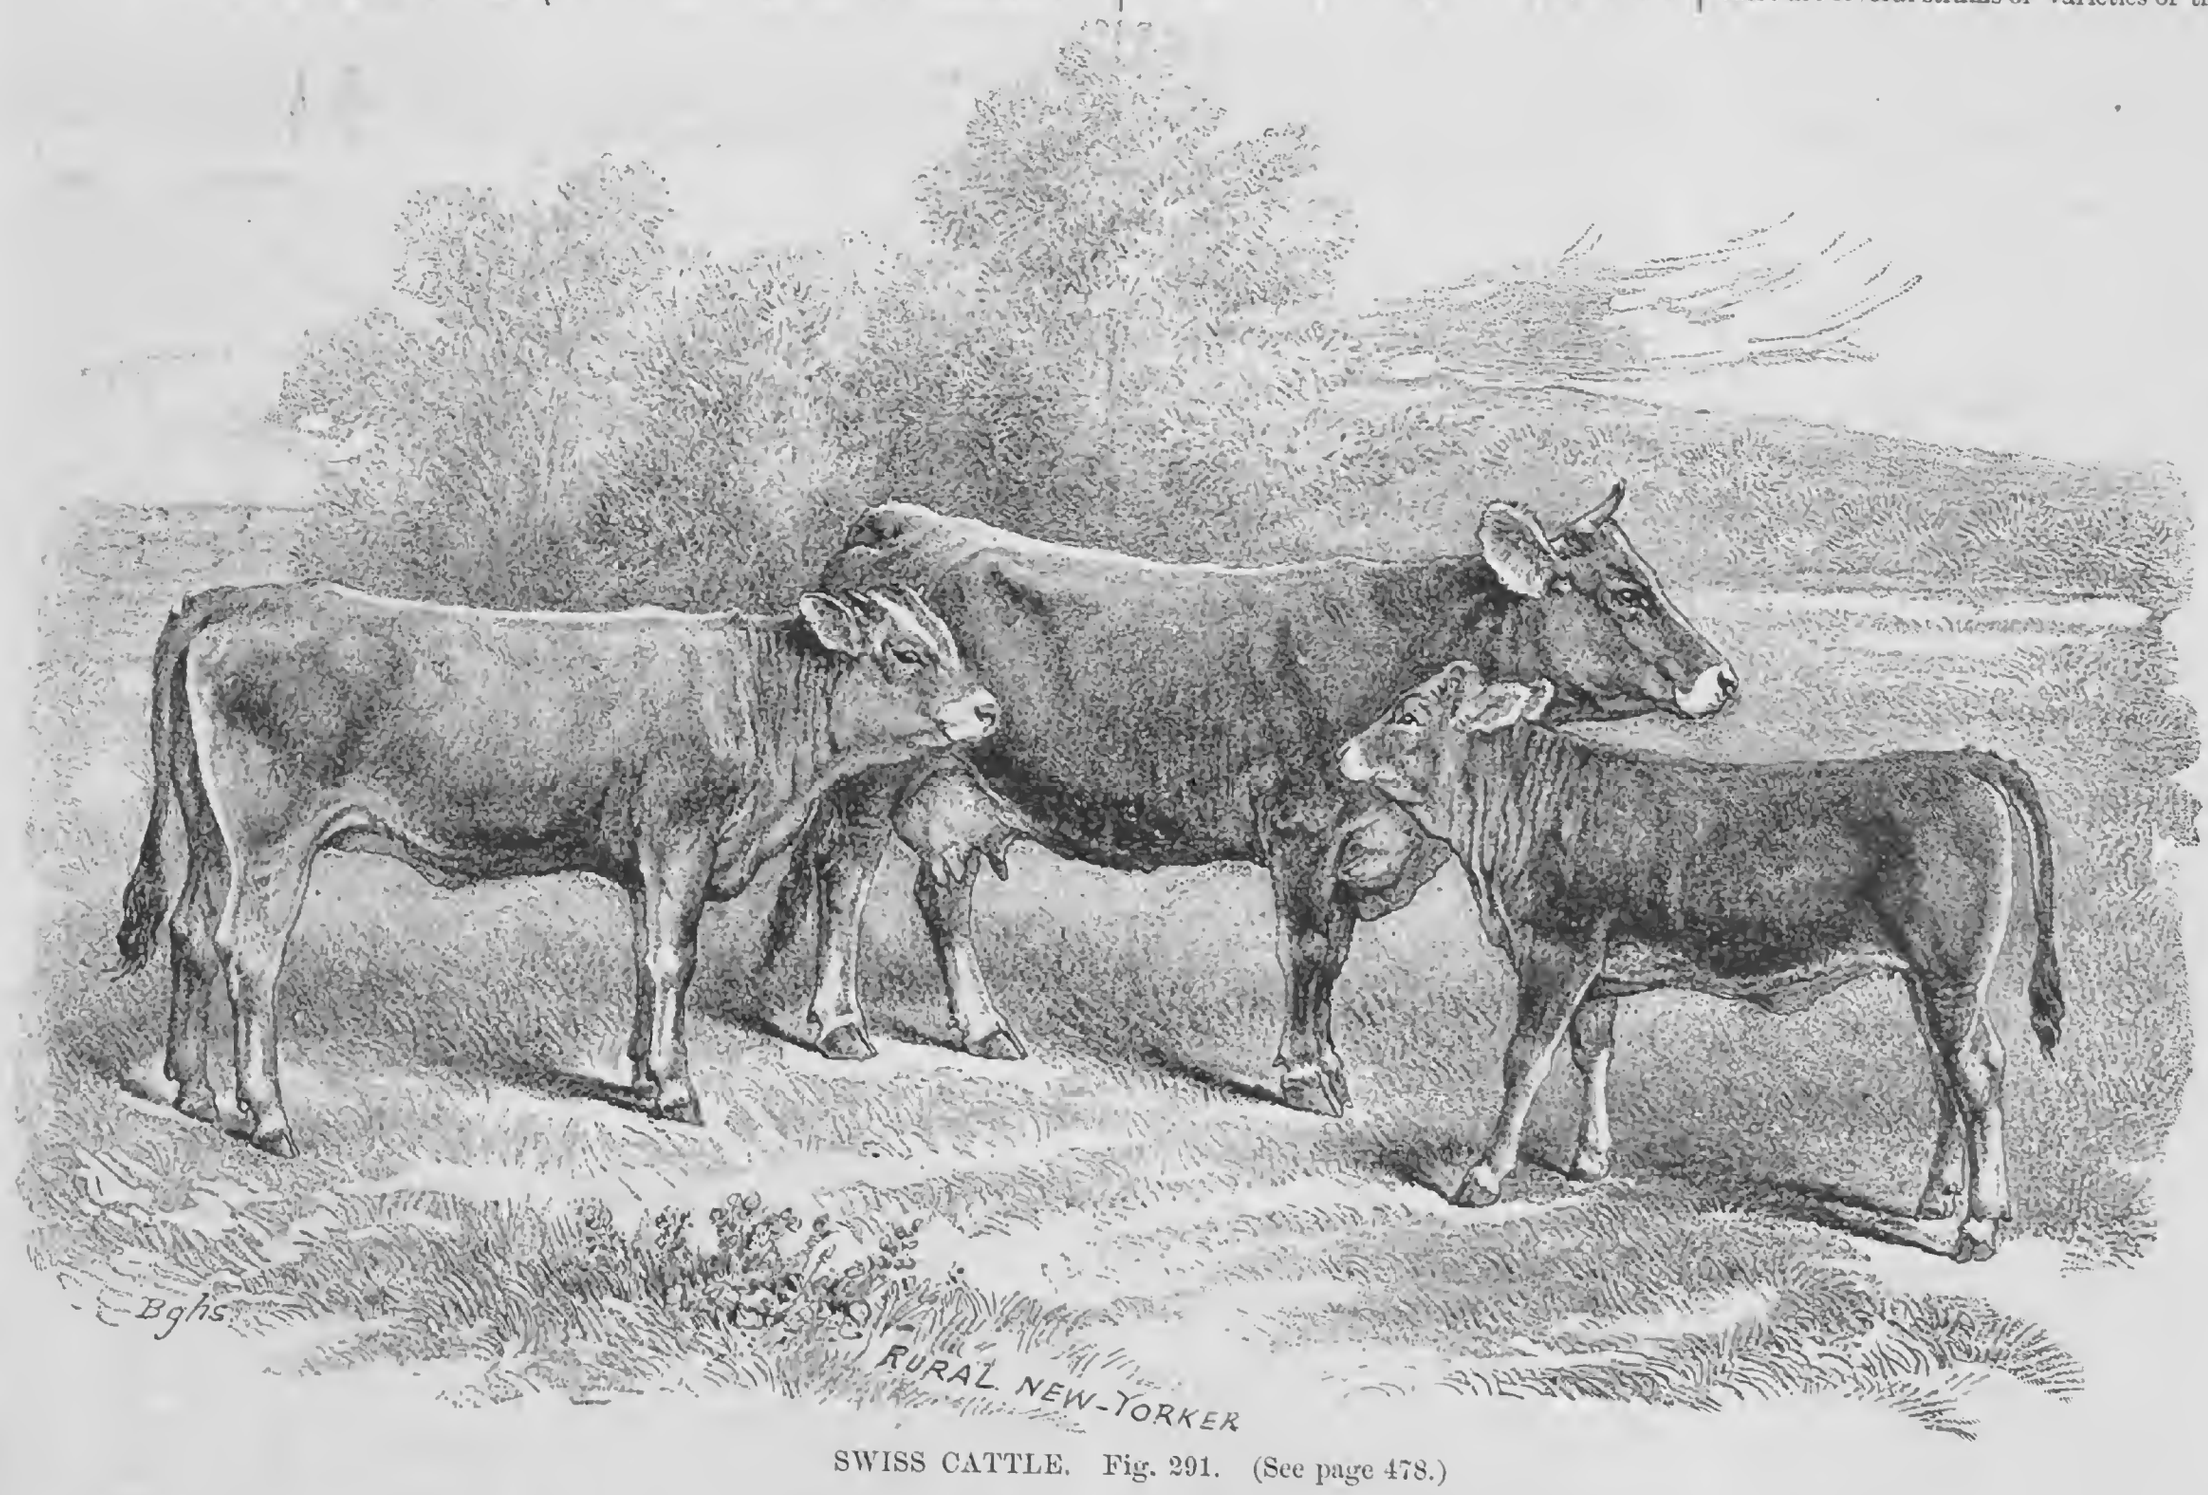
EVERYBODY has heard of the Swiss chalets. Many persons have seen pictures of them made of highly carved ornamental work, perched upon a crag or the mountain side, with a foaming cataract pouring into the back window and an overhanging avalanche all ready to fall and sweep down the almost perpendicular slope. And the gaudy neck strap and its big bell. This is the artist's idea of a Swiss chalet. When, years ago, I spent a vacation among the Swiss mountains, I looked in vain for all this, and yet I found lots of chalets and cows and cowherders of both sexes, but very different in their reality from those of the artist's imagination.

Fancy a mountain side, steep and rocky, with well worn paths among the rocks, leading from one little green, grassy slope or flat to another, the grass thick and short, but rich and succulent, and as you turn around a crag, a rough log hut built against the steep mountain side, which has been dug away to make the hut fit into the nook. The front projects several feet and is supported by rough posts; the roof is of split logs, covered by bright moss and grass in places where soil from above has lodged on it, and as you look up, a goat or two look down upon you, as they chew mouthfuls of grass they have bitten off from the grassy roof. This is a real Swiss chalet. All around are green grass and moss on the damp rocks, from which, among ferns and flowers, flows down a little rivulet of sparkling water, cold as ice and as pure. A little way off on the level bench is an open shed of logs and split slabs, in which the cows are milked, and which one sees is badly in need of being cleaned out.

A cooking pot hung upon three sticks and a few flat stones around it for seats, mark the site of the kitchen, which is airy, no doubt, but yet smoky, as the gusts which whirl down the mountain blow the dust and the sharp vapor from the smouldering, half-rotten wood fire into your eyes.

If you look into the chalet you will see its rough walls, the equally rough roof through which a stray sunbeam glints down through the smoke from a fire on the floor, on its way out through the open gable, which serves as a chimney and a window at the same time. The fire is built against a rock which projects into the chalet, and a part of the same rock makes the hearth. A wooden gallows frame supports a big iron kettle over the fire, in which the milk is warming in preparation for making a cheese of the kind known as Gruyère. The requisite utensils, all of wood, but all white and clean and sweet as hot water and sand can make them, lie around on benches and on shelves. An annexed shed, equally rough, contains the milk in earthern jars, which is set for cream, and the churn and ladles and some "chunks" of butter, which is of half-a-dozen wild, bare-footed, rosy-cheeked boys and girls, who clamber over the rocks here and there. But she has a long tin horn with which she calls the cows home, and they generally come when they hear it blown. But they are not far away, for while we talk with the man we can hear the bells tinkling and perhaps see the cows on a crag cropping grass, and the blue sky or a glittering glacier in the distance, as a back-ground behind them.

And this brings me to where I should have started—the Swiss cows. But it is interesting to note the kind of country and the circumstances which have made these cows what they are—hardy, rather coarse, but stout, robust and just suited for the life they lead. But as elsewhere there are cows and cows, so there are in Switzerland. For the native race have been selected and bred and fed and trained with great care and jealousy, and there are several strains or varieties of them,



SWISS CATTLE. Fig. 291. (See page 478.)

hardy mountaineer, in pink tights and yellow jacket, with slashed and embroidered sleeves and a broad hat with a big feather in it, blowing a horn to call the cows home; while the pretty red-cheeked mountaineeress, all picturesque in red stockings, short green skirts, and white bodice, laced wonderfully in the front, and open enought to show the snowy lace which covers the bosom, and a wide straw hat with a lot of gaily colored ribbons floating in the breezy air, waiting with her milk jar and three-legged stool for the cows which are seen away behind all, coming down the perpendicularly precipitous crags as carelessly as if they were on a level meadow, each with its

very yellow and very sweet and rich, and which the mountaineer tells us goes to the "pension" away up the mountain. The rich herbage of these mountain slopes, nooks and sometimes fields, where a cove sets up in the mountain side like a bay in the ocean, and the occasional open woods and forests, gives a fine flavor to both the butter and the cheese, and a high color as well. The herdsman is a blue-eyed, round-faced fellow, dressed in brown homespun and has wooden shoes; while the "Swiss maid" is sun-burned and has thick shoes and no stockings at all, and has homespun petticoats and no ribbons on her hat, and rarely a hat at all, and is the mother much alike in the main, but to believe their owners, differing very much in excellence, each being better than the others by a very great deal indeed. The variety known as Schwitz (including four sub-varieties of Gessenay, Simmenthal, Emmenthal and Erlenbach) has been bred with much care, and as the summer pasturage and the Winter keeping in the valleys are of the best kind, these cattle are the most valuable of all the Swiss races, and are sent abroad to the French and German dairies in large numbers. The prevailing color is a yellowish red and white, the frame is large and rather coarse, the disposition is quiet and docile, and the milking

capacity is large and rich, 18 to 28 quarts a day being a common yield. They fatten very easily, and will yield from 700 to 900 pounds of dressed beef. This breed is more interesting to us because it has been introduced here for some years past and has met with considerable favor in New England, Pennsylvania and other localities. The conditions of climate and topography, however, are so different here from those prevalent in Switzerland, that it must be expected some change at least will occur in the character of the cattle which have been imported, although we cannot say that this may not be for the better quite as easily as it might be for the worse.

It should not be forgotten that the winter care of these cattle in Switzerland is quite different from that in the Summer; for as Winter approaches they are brought down from the mountains to the villages in the valleys, were the pastures are fresh and smooth, and where, in the colder weather, they are fed in warm stables upon the sweetest of hay and some additional food. Here the milk is largely used for condensing, for which there are extensive factories upon the American system (American ways and methods penetrate everywhere.) This condensed milk is sent abroad where it competes with our product, and it has even made its appearance in American cities. On the whole, the Swiss cattle may not be a very valuable acquisition here, but at any rate we might easily go very much further and fare very much worse in getting a good herd of cows than to chose the Schwytzers, if we did not pay too dearly for them.

On the first page, Fig. 292, we present a group of Swiss Cattle, the property of John B. Eldredge, Middle Falls, Washington Co., N. Y. In the center is the cow Eva Burgi, imported by her present owner on June 1, 1885; dropped May 26, 1880, and bred by G. Burgi, of the Canton of Schwytz. Her record number is 248 in the first volume of the Brown Swiss Cattle Breeders' Association of America. On the right is the heifer calf Jennie Burgi, calved January 5, 1885, imported in her dam, Eva Burgi, 248. Her number is 264 in the second volume of the above Swiss herd record, not yet issued. On the left is the heifer calf Maggie Burgi, 262, imported in her dam, May Burgi. She was dropped Sept. 2, 1884.

LEADING STAFF FOR BULL.

MR. A. C. CARPENTER, of Dakota Co., Minn., sends us the design for a leading staff, shown at Fig. 294. A staff should always be used in handling an unruly bull. It is folly to do

Fig. 294.

without one. Too many lives have been lost in the attempt. The staff is made of hickory. The iron used to attach the harness to the hame is fastened to the wood as shown. To this is fastened a snap that can be easily caught in the bull's ring. Cheap, easily made and strong, is the best description we can give of this staff.

Dairy Husbandry.

FAULTY CONCLUSIONS FROM MILK COMPETITION.

THE London Live Stock Journal (Eng.) gives the annual report of the British Dairy Farmers' Association on the milking competition of some of the dairy breeds at the show of 1885, and the analyses of the milk, in which the "dairy" Short-horn, the Jersey, and the Guernsey are reported as follows:

	lbs. of milk per day.	Solids.	Fat.
55 Short-horns.....	42.89	12.68	3.62
42 Jerseys.....	27.34	13.70	4.17
23 Guernseys.....	27.43	13.87	4.52

The above-named paper then comments on the facts from the milk-yield stand-point per cow, and shows this conclusion, speaking of the Short-horn:

"Certainly no other breed in the country possesses such a record, and it goes far to prove this race to be the most profitable for the dairy farmer."

I am disposed to disbelieve conclusions when the statistics do not prove them, and so do a little figuring with regard to the above:—Premising the generally-conceded facts in cattle-feeding—to wit, that bovine animals consume food according to each 100 pounds of live weight, and especially so when they are devoted to the same work or purpose; and assuming that an average lot of cows of the breeds named weigh, Short-horns, 1,200; Jerseys, 800; and Guernseys, 950 pounds each, we have our data to proceed with, and see by the table that 100 pounds of Short-horn cow produces, per day, 3.57 pounds of milk; the Jersey 3.81 pounds; and the Guernsey 2.88 pounds. The milk of each cow, multiplied by the per cent. of fat the chemist found in it, shows that the Short-horn made 1.29 pound of butter per day; the Jersey 1.58; and the Guernsey 1.30 pound.

Applying the test according to weight of cow and weight of food, it shows that 1,200 pounds of Short-horn cow made 1.29 pound of butter per day; 1,200 pounds of Jersey cow made 2.37 pounds; and 1,200 pounds of Guernsey cow 1.64 pound. These are the cold facts from the table, as made by the officials, concerning 120 cows, and computing the breeds of cows at the average weight they are known to be. In giving the above figures it must be remembered they represent the butter oil of the chemist, and should have 15 per cent. of water added to each to represent butter as it is consumed.

Should not the London Live Stock Journal amend its conclusions, and wrestle with the conundrum whether it would rather have 3.81 pounds of rich milk, in pint cups, or 3.57 pounds of low-grade milk in quart measures, at the same cost of food; or 2.37 pounds of butter on a small plate, or 1.29 on a large plate?

This talking about so much yield per cow, regardless of the weight of the cow or of the weight of what she eats—though a mighty common thing with dairy writers and breeders of large cows—it is just as absurd as to compute the cost of potatoes, per bushel, by the size of the farm. Dairy farmers have been fooled by such stuff long enough.

It must be noticed that the cows in the competition were dairy Short-horn; those of the pronounced "milking strains," the bovine goddesses before which John Bull goes down upon his marrow-bones to worship; and presumably there are none of the breed better; but the pick of 55 show animals gave milk of which it took 28.90 pounds to make a pound of butter, even after 15 per cent. of water is added to the fat of the chemist. Such milk would be called skimmed at the American creamery or cheese factory; or if pro-rated with "scrub milk," the manufacturer or owners of scrub cows, would be robbed by the owners of Short-horns of such a "milking strain." BADGER.

A JOINT-STOCK CREAMERY.

THE Clayton Creamery, at this place, is owned by the farmers of the community. There are 400 shares, with a face value of $10 each. Five directors are chosen every year by the stock-holders. In the six months ending May 31 the creamery received 2,050,726 pounds of milk, or 11,267 pounds per day. From this 88,975 pounds of butter were made, or 4 1-3 pounds per hundredweight of milk. For this milk $24,592.10 were paid out, making $1.20 per hundredweight, or three cents per quart. All the expenses of the creamery, exclusive of milk, came to $2,839.66. Separators are used with satisfaction. Skim-milk is sold to patrons at one-third of a cent per quart. It is found better to have patrons bring their milk to the creamery than to gather the cream. There is less chance of adulterating the milk than the cream. A lactometer is used to detect the watering of the milk. For every degree that the milk test falls below the standard for the month one cent per hundred is deducted from the price of the milk. More cows are now kept by nearly every farmer. The house-wife is relieved of a great labor. Farmers learn to milk, and the sons relieve their mothers and sisters. Fields and meadows become more fertile. More attention is paid to breeding. Stock creameries open a way to more profitable farming in many communities. They are to be preferred to private parties. They may not, under all circumstances, be preferable to other means of dairying, but in some places they succeed admirably. Grain raising becomes more and more unprofitable. Good farmers say it costs one dollar to raise a bushel of wheat that must be sold for 95 cents or less. Have any of the RURAL readers tried to seed down their fields with a crop of oats? If it is possible to get a good "catch," would it not pay to raise corn—a silage crop—oats and hay in rotation, and let wheat go as long as we have to pay five cents or more per bushel for the fun of raising it? Is such a plan feasible? Let us hear from others. NADITOR.

Clayton, Pa.

A NOTE OF CORRECTION FROM MR. HENRY STEWART.

AS the statement made by T. D. Curtis in his Dairy Notes (page 430) to the effect that Prof. Stewart "has advocated the use of pulverized sugar with salt in making butter," may be credited to me by many readers of the RURAL, who have read articles of mine upon dairying, I beg to disclaim the credit of it, at least in the sense in which Mr. Curtis makes use of it. "Good wine needs no bush," and good butter needs no sugar; but I remember on one occasion, in describing the process of "milling" store butter for market, that this mixture of one-fourth part of white sugar with the salt was mentioned as being commonly used. "Necessity makes us acquainted with strange bed-fellows" as Trinculo said, and so it works the mischief in making up the mixed mess called store butter, which is gathered up in country stores from farmers' wives who trade it out. Some way of disguising the sourness, rancidity and overpowering want of sweetness in this various and varied butter is needed to make it salable, and no doubt the sugar, salt, pepper and other flavorings are justified. But merely mentioning the fact is not recommending it, and I beg Mr. Curtis to absolve me from any possible or supposed wrong-doing in this direction.

The Poultry Yard.

THOROUGHBRED POULTRY.

THE growing interest in thoroughbred poultry is by no means sectional, East, West, North and South having the same awakening to this pleasant and profitable business. I believe the United States have many advantages over other countries for the maintenance of poultry, yet the large amount of poultry products annually imported shows the need for the further development of poultry raising, and the RURAL shows commendable enterprise in promoting the work. Why should not every farm, village and suburban home be supplied with eggs from its own hennery? It is the small flock that gives the large profits. Poultry in large numbers are profitable, but not proportionately so. The man who can make a large flock yield in proportion to one of say, 10 to 25 in number, will be one of the most fortunate benefactors of the age.

Is there any specific for poultry diseases? Yes; cleanliness. It is a panacea for nearly every disease common to fowls; the ounce of prevention is worth a ton of all the remedies recommended for their cure. Of good breeds there are many, but he who ventures to name the best is certain to bring upon his head the wrath of many who are justly wedded to other varieties. After an experience, however, of upwards of 10 years in the care and management of poultry, with an eye ever open to the good qualities of the various standard breeds, I will name my favorite, and briefly state my reasons for believing it to be pre-eminently the practical business fowl of to-day. While a few may challenge my opinion, there are hundreds who will come to my support and bear willing and emphatic testimony to the high qualities of my choice.

That fowl is the Plymouth Rock. It is hardy—a quality that cannot be overestimated, yet one that is lacking in many breeds. In size the fowls of this breed are a happy medium between the over-large Asiatics and the small, restless Leghorns and kindred varieties. Their meat is juicy, and they take on flesh easily, so that they are well suited for table use. They bear confinement well, and possess in a high degree, that quality that forms three-fourths of the real worth of any fowl, being remarkable, often phenomenal layers. They are excellent for crossing with other varieties, their progeny always showing the marked characteristics of the breeds. I believe them to be fully entitled to the high position they have attained. A. C. K.

Cobleskill, N. Y.

Farm Topics.

CORESPONDENTS' VIEWS.

LAST Winter Salem, Merrimac, Diana, Alvey, Triumph and Jefferson Grapes were killed to the ground, when left on the trellis. Goethe, Norton's Virginia, Concord, Perkins and some other very hardy sorts had much wood and many fruit buds killed. The Ives and some of the Riparia family were left intact. Herbemont, Alvey and other semi-tender sorts, laid down in the Fall and simply weighted with a stone or brick—not covered in any way—did not lose a fruit bud. For strawberries, Cumberland, Longfellow and Sharpless were fine. Henderson is best of all for quality. W. L. DULANEY.

Warren Co., Ky.

THE quoted Japanese method of planting a tree by first filling the hole half full of water and then filling with soil, is not peculiarly Japanese. It is an old practice here, although perhaps less common than it deserves to be. It is often used by gardeners in setting out vegetable plants, strawberries, etc., in dry weather. But its advantages are not so much due to the supply of water to the feeding points of all the roots just where wanted, as to the floating of the fine soil into every interstice so as to completely prevent chambers of still air for the generation of destructive mould, and to the open condition of the surface soil, which is not compacted by surface watering—a practice which prevents the necessary entrance and circulation, in moderate stream, of health and growth-sustaining air. "W."

Tyrone, Pa.

FOR years my cabbages were spoiled by worms. Last season, '85, when the pests made their appearance, I put among the young cabbages a broad-mouthed fruit jar partly well filled with sugar and water. The millers went into the bottle, so that in 24 hours 125 were caught. I killed, perhaps, a dozen worms which had got on the plants before I put the bottle there, but scarcely one after that. I had good, clean cabbages for the first time for years. This season my bottles are in the garden getting filled with millers and wasps and my cabbages are clean.

Braintree, Vt. L. H. SPEAR.

THIS has been an extraordinary year for plant lice. The uncommon plum leaf aphis has swarmed on every plum tree. The cherry tree plant louse has badly injured cherries. The apple-peel fungus has covered everything. Trees that are struck with the blackened, burnt-up appearance have little or no fruit. Those with fairly healthy foliage are better. Trees that did not blossom did not escape a certain amount of the leaf attack. Trees blossoming the latest of all hold their fruit best.

Clyde, N. Y. W. X.

PEOPLE here are in no danger of starving because they can't sell bait to the Yankees. I have lived here 58 years and never knew anyone to starve yet. People go to the "States" to make money or because it is too "hot" for them here, but I never knew them to go because they couldn't get enough to eat up here. We are not compelled to sell bait in order to keep alive. D. S.

Manchester, N. S.

I AGREE with the RURAL that the Mikado and Turner's Hybrid Tomatoes are the same. I have them from both houses, and there is no difference. I also see very little difference between the Stratagem and Pride of the Market Peas. F. S. WILSON.

Des Moines Co., Iowa.

I HAVE an orchard of 1,300 fruit trees. Have good peaches. My trees came from Alabama and from Southern California. Those from Alabama are by far the best. We are 5,000 feet above sea level. Three years ago I started a carp pond: I procured small fry, two inches long, from the Texas State Fish Commissioner. We have now fish weighing from five to seven pounds and thousands of smaller ones. We find them equal to any fish for eating purposes. Johnson Grass makes, in my opinion, the best hay for my horses and cattle, better even than Alfalfa. Stock do not care much for it green, but they will quit grain for the hay. G. A. BREMER.

Presidio Co., Texas.

SOME of our best farmers about here are making big money raising English Blue Grass and flax. The two are sown together in the Spring. The flax is sold at $1.25 to $1.40 per bushel on board cars. The Blue Grass seed brings $2 per bushel, while the straw is a fair cattle feed and the stubble will support stock long after the prairie grass has died.

Lyons Co., Kansas. W. N. B.

YOU can judge a farmer by his scare-crows about as you can by his cattle or dog. In a recent trip through New England I found the fields filled with these would-be objects of terror. The most common object is a human effigy—"a live man stuffed with straw." These "men" vary from a fair representation of the *genus homo*, with hat and boots complete, to an old shirt hung on a stick. I doubt if crows ever mistake these objects for human beings. Some farmers put twine all around the field and tie pieces of cloth to it. I noticed a toy wind-mill with pieces of glass so arranged that they sparkled in the sun. Anything that will make a noise, like a bell or clattering sticks, will prove effective. A dead crow tied by the legs to a pole so that he will swing in the wind, will carry fright to the hearts of his companions. Early rising and a good shot-gun will prevent serious damage without any scare-crows. Tarring corn seems to have gone out of style. I doubt whether it pays for the trouble. If the present bird-slaughter goes on, the scare-crow question will surely be settled, for there will be no crows left to scare. The most ill-tempered corn-grower would rather let the crow steal some corn than to have him exterminated. I think the damage done by crows is largely over-estimated, yet it takes a very patient man to admit this when he finds part of his corn pulled up. For my part, I like crows

for about 11 months and 10 days in the year. The balance of the year—well, I wish they would let the young corn alone. J. H. G.

Queens Co., N. Y.

We send milk into the city. The greatest trouble we have is to keep the milk in hot weather. I put it down the well but it would not keep unless the can was plunged beneath the water. The foul gas just at the surface of the water caused the trouble. I had irons made to hook into the handles of a large milk can, put a windlass at one side of the pump house, ran a rope up to the roof, over two pulleys, then down to the well. I cut a hole in the side of the trap door so the hole can be closed when the milk is down the well. The milk now keeps well and the water is not injured. A good creamer would be fine for keeping milk. R. CRANE, JR.

Bucks Co., Pa.

I noticed an arrangement for pulling an animal out of a well in a recent Rural. Out here we must suit ourselves to circumstances. Oftentimes pulleys and stout mules are far away from the scene of action. Then we use what we call a Spanish windlass. Take a stout piece of timber, a round pole generally, bore two holes in each end and insert stout pins about four feet long. Crossed stakes are driven into the ground on either side of the well, and the timber placed on them so it will turn readily. The rope is fastened to the center of the pole over the object to be raised. Two men at the ends by pulling down on the sticks can easily raise a ton. Z. L. MARTIN.

Williams Co., Oregon.

PLAT EXPERIMENTS.

I was much interested in the remarks by Mr. Emery on plowing plats at Houghton Farm. Mr. Emery sees very clearly part way; but it seems to me that he does not see clear through the case. He says, "On all plots of ground which are to be differently fertilized, every possible condition, except that of fertilization, is made identical." This is first-rate. But does it follow that because we endeavor to make the conditions that are under control identical, all other conditions are thereby identical? Until by similar treatment we can secure duplicate results on different plats (and this has rarely been accomplished), it is evident that plat experiments are at best uncertain, and may be positively delusive. What the unknown conditions are, the wisest cannot always guess. It is rarely that we know the history of a piece of ground for more than a few seasons; while we know perfectly well that soil often shows the effect of particular treatment through many years. A ditch dug across a piece of ground, the site of a former fence, the corner of an old pasture where cattle were wont to pass their nights, or the site of an old barn often exerts an influence upon the soil that a generation of cropping is scarcely able to obliterate. Even if we know the history and character of the tillable soil, we cannot often know much of the sub-soil, and there are reasons for believing that this often exerts a considerable influence upon the crop. The fact should be more generally recognized by experimenters, that in plat experiments we must necessarily start with an unknown quantity. It is only through the use of a sufficient number of duplicates so that the variations may be assumed to balance each other, that results are to be depended upon at all.

Indeed, it is not so easy a matter to secure duplicate yields, under artificial conditions, which are, to all appearances, entirely alike. In the Spring of 1885, I had a quantity of garden soil, sand and muck thoroughly mixed, by repeated shovelings. I then sawed three 45-gallon barrels in two, in the center, making two large tubs of each. I then took five of these tubs, and bored four drainage holes in the bottom of each, measuring with the greatest care to have them equi-distant from each other, and from the outside of the tub, the distances being made the same in all the tubs. I next filled the tubs with the mixed soil, striking the top as we strike a measure of grain, and set them into the ground at such a depth that the staves reached about an inch above the surface of the soil. This was to prevent surface water from getting into the tubs. I then took five White Star Potatoes of very nearly equal size and shape, and cut off six single eye cuttings from the stem end of each, the first of which I rejected. The remaining five cuttings I made exactly of the same weight by paring off the heavier ones until all balanced with the lightest one, using a scale graduated to grains. I then planted five of these cuttings in each tub, so placing them that while each tub contained one cutting from each tuber, each tub also contained one second, one third, one fourth, one fifth and one sixth eye from the stem end of the tubers. The cuttings were planted by means of an instrument made for the purpose, which secured equality in depth, distance from each other, and from the sides of the tub. The plants were allowed to grow through the season, and when the tops were dead the tubers in each tub were weighed, with the following result: First tub, three pounds five-and-thirteen-sixteenths ounces; second, two pounds fourteen-and-eleven-sixteenths ounces; third, five pounds one-and seven-sixteenths ounces; fourth, three pounds nine-and-nine-sixteenths ounces; fifth, four pounds thirteen-and-fourteen-sixteenths ounces; giving a difference in the yield in different tubs of nearly a hundred per cent.

The difference was so striking that I determined to search for the reason. On lifting the tub that gave the heaviest yield, I discovered that two strong roots had penetrated through the drainage holes into the sub-soil. The one giving the next heaviest yield had put down a single rather slender root in the same manner. The roots in the other tubs remained inside, but it appears above that the yields from these were not similar.

I have given the details of this experiment to show how little we really know about the conditions that influence the growth of our crops. E. S. GOFF.

Geneva, N. Y.

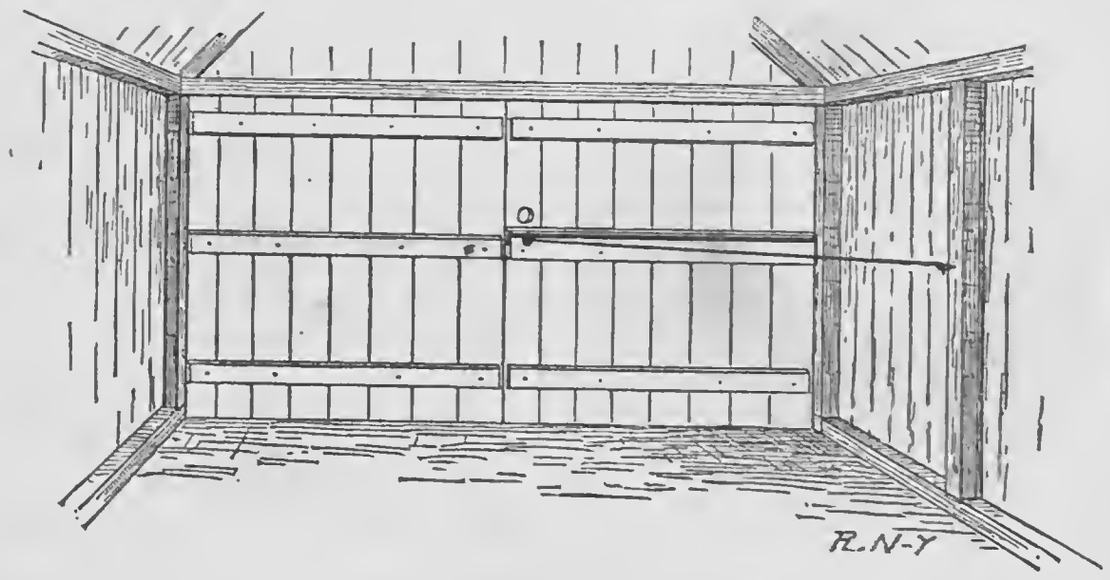
Farm Economy.

RYE AS A GREEN MANURE.

Experience with rye turned under; an unmanured piece gives results just as good; rye turned under, a fair mulch, but not a fertilizer; comparison of rye and clover roots and tops; chemical composition of both; rye returns only what it has taken; mechanical effects.

Noticing the inquiry of M. B. in a late Rural regarding the experience of others in plowing under rye to enrich the land, I am led to relate an experiment of mine some years since with much the same result. I was inclined to the belief that rye was valuable from that superficial kind of reasoning which we find in every agricultural paper at some time during the year, to the effect that no other plant will furnish so large a bulk to be turned under in so short a time, so surely and with so little expense. My land was growing poor from the effect of several dry seasons and the consequent killing out of the clover, and, like M. B., I sowed rye in the Fall in my corn the last time I went through. One field of 10 acres was all sown, so strong was my faith, but in another of 12 acres I only sowed eight acres, leaving four acres for the lesson a contrast would give me. These fields I plowed the next year for wheat. The rye was turned neatly under the first of June, just as it was fairly headed out, but before the grains had formed. All the field of 12 acres was plowed at the same time and treated alike in every respect. My faith was so strong that I could not help feeling sorry all the season for the poor four acres that had not been enriched by "green manure." The fields were sown to wheat in due season in the Fall, and to clover seed in the Spring, but I could never find where the "green manure" ended and naked fallow began by any perceptible difference either in color of leaf or size of plant. The clover made a good growth fortunately on both fields, but never was any better on the "manured" part than on the four acres that had received no rye treatment. I have plowed the fields several times since, but could never find any indication of any results from that application of green manure. The soil was sandy loam—just the character to be benefited, if we may trust the theories so often presented. This is not an individual failure here. I have never known any permanent benefit to come from the use of rye plowed under, except in the peach orchards along the shore of Lake Michigan. There the people depend upon it more for Winter protection than for the manurial value that is received from it.

This failure of mine led me to investigate into the causes which blasted such great expectations. I was satisfied that the benefit to be derived from green manuring must be sought in something beyond the bulk of plant growth thus furnished to the soil. There must be some affinity in the plant with the forces that nourish crops, to make it valuable as a fertilizer. This affinity clover posseses, while rye does not. Let us look at its value as compared with clover as a manural product. By actual test it has been found that the ratio of root to top in mature rye is as 10 to 135, and in mature clover it is as 10 to 15—the stubble in both cases is counted as part of the root. Here we have two-thirds as much root as top in the clover, and nearly 14 time as much top as root in the rye. As to the chemical composition of the roots of the two, this difference occurs. In an acre of the roots of rye, there are 62 pounds of nitrogen, and in clover 180 pounds. Of lime there are 69 pounds in the rye and 246 in the clover. Of potash there are 30 pounds in the rye, and 77 pounds in the clover roots. Of dry vegetable matter in an acre of roots of rye there are 3,400 pounds, and in clover 6,580 pounds. This from soil only 10 inches in depth. Where the rye roots extended only eight inches in the soil, clover roots were 16 inches long, so that in the computations, all the rye roots are included, and not all the roots for the clover plant. Now supposing both be turned under for a wheat crop, the rye will furnish 40 pounds more of nitrogen to the acre than is required by the wheat, but clover will give a surplus of 140 pounds. Of lime the rye fails to give enough within three pounds, while the clover leaves 174 pounds stored up after the wheat is grown. Rye, in my opinion, only pays back to mother earth, when it is returned as a green manure, its indebtedness for the pabulum required in its growth. I do not believe it adds anything to the fertility of a soil. A hard clay soil may be changed mechanically for the better by becoming more open and friable, but in my opinion the chances are rather in favor of a loss on sandy soil by turning under either rye, buckwheat, or corn. I know this is rank heresy, but M. B's experience is not an isolated case of damage. I know a field of 10 acres which was sown to corn, plowed under when it had begun to tassel and sowed to wheat. The owner believes that it actually injured the land, as the following crops were unusually poor for several years. There are plenty of such traditionary practices continually coming to the front, to wheedle the inexperienced. There is really no short cut to prosperity on a poor soil, and he who pins his faith to rye as a renovator will be sadly disappointed in not seeing waving wheat and corn following waving rye. A. C. G.



HANDY DOOR LATCH. Fig. 295.

HANDLING FENCE WIRE.

Mr. W. S. Smith, of Pleasant Valley, Ills., sends us the idea illustrated at Fig. 301. He found it very awkward for one person to unwind the wire from a reel when no team is at liberty to draw it. He had a two-horse cultivator, with hooks on the back ends of the double tongue to hold up the plow beams and shovels. He removed the beams, and, putting a strong round stick through the reel of wire, placed little blocks on each side of the reel to keep it from interfering with the tongue in turning over. The stick was then placed across the hooks, and one end of the wire fastened to the end post of the fence. The cultivator was drawn by one man with less work than two men would expend in carrying a reel between them on a stick.

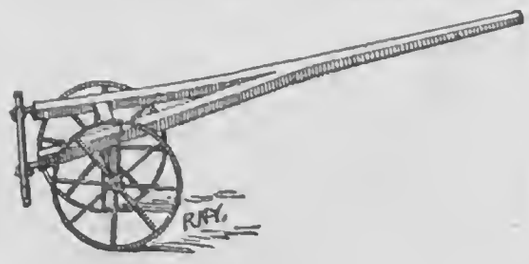


Fig. 301.

HANDY DOOR LATCH.

Mr. A. Freed, of Lancaster, Ohio, sends us the sketch illustrated at Fig. 295. He has the latch in use and is well pleased with it. Where doors can be mounted on pulleys and rolled aside on a track, the latch will not be useful. There are many places where no room can be found for track and pulleys, and where the doors must be hinged and swing out. In such cases this latch will be found strong and convenient. A rod of five-eighths inch iron is bent at right angles at each end; the sliding end three-fourths of an inch, and the fixed end 1½ inch. The fixed end is dropped into an eye bolted to the studding, as shown at Fig. 296, F, with the bent wire at E. The length of the rod varies, being the hypothenuse of a right-angled triangle, of which the door is one side. The free end slides in a groove or guide on the middle arm of the door. This is shown at Fig. 297. Boards are nailed on the arm, A, projecting three-fourths of an inch above it and raised at the top so as to form the guide. B is a notch into which the rod falls when at rest, thus holding the door. When the door is opened, the rod is raised out of its notch, and as the door opens the rod slides in the guide till the door is in line with the wall, when the rod is entirely out of the way, as shown at Fig. 298.

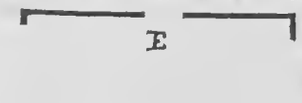

Fig. 296.

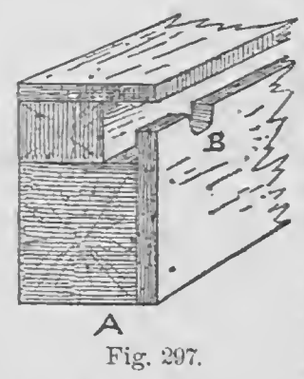

Fig. 297.

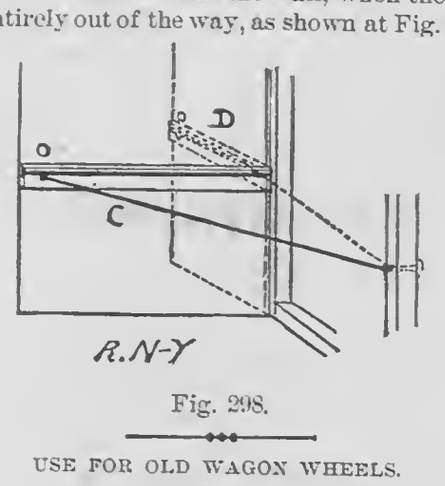

Fig. 298.

USE FOR OLD WAGON WHEELS.

At Fig. 300 is shown how an old wagon wheel can be turned into a revolving stand for drying milk pans, etc. The spokes, hub and rim are all painted red, while the tire is painted white. The axle is then buried in the ground so deep that the wheel comes to about the hight of a common table. Pans, jars and pails can be placed upon this in the sun. It can be readily turned about so that any article can be reached without moving.

Fig. 300.

SMOKE-HOUSE.

The smoke-house shown at Fig. 299 does not cost much and is easily made. Common barn siding, six feet long, will answer. The sides

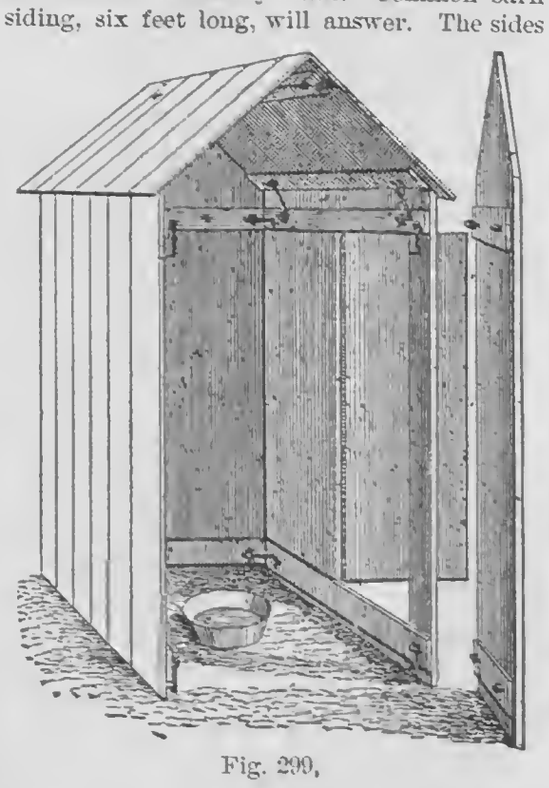

Fig. 299.

are made of any length desired. The siding can be nailed to stout cleats. They are then fastened at top and bottom with staples and hooks, as shown in the illustration. The top is formed of two pieces, and is hooked together in the same way. A small door at one side can be hung on leather hinges. A pan or small

brick arch at the bottom will hold the fire. This can be put up and taken down at short notice. It will not be in the way when not in use, and you can lend it to the neighbors if you desire so to do.

Pomological.

THE DUMAS PEAR.

BELLE EPINE DUMAS is the long French name for this pear. In size it is medium; in shape, pyramid and obovate, gaining its full swell about midway between the stem and calyx. At maturity it takes on a brilliant yellow tinge, with usually a red cheek. Its flesh is white, melting and pleasantly aromatic. The portrait, Fig. 292, with a cross-section at Fig. 293, is correct. The pear ripens gradually through November and December. Except for its lateness, it would not be sought because only medium in size. The Seckel, the Ott, the Dearborn's Seedling are the only small pears that people hunger for. Only large and luscious pears, as a rule, find ready purchasers. W. H. NOBLE.

Bridgeport, Conn.

THE DUVAL PEAR.

I FULLY agree with Hon. Marshall P. Wilder, the venerable head of the American Pomological Society, as to the quality of this pear—good to very good. The very good comes in in this, as in a great many pears, by the care you give to the growing, to thinning on the tree and to keeping. Not every pear shows, like the Seckel, excellence in its very nubbins. A good many only gain their best estate when thinned so as to average full size and get a complete development. Long keeping and reluctance to decay are qualities which should always call for choice in good or very good pears. These the Duval has equal to almost any one I know. It never takes on that inveterate rot to which some pears are "as prone as the sparks to fly upward." W. H. NOBLE.

Horticultural.

RASPBERRIES IN 1886.

HIGHLAND HARDY Raspberry showed the first ripe fruit this season on June 26.

MICHIGAN EARLY followed two days later. This proves to be hardy at the Lake Shore, and fairly productive. The fruit is of medium size, and of rather bright color, but not, so far, earlier than at least half a dozen others. In flavor it is poorer than almost any other variety I know. I see no reason to be flattered by the prefixing of Michigan to the name; nor do I understand why this is done, since, so far as I am informed, it is unknown in this State, coming to us from the East.

QUEEN is a variety without a sponsor, so far as I am informed. Although not attractive in color, it is of good size and excellent flavor, producing an abundant crop of very perfect berries. A desirable berry for the family garden.

SURPRISE (history unknown), Crimson Beauty, Superb, Brandywine, Cuthbert, Turner, Reder all ripened nearly together within the next three or four days.

HANSELL I shall abandon, as not earlier with me than several others, while it is comparatively unproductive, small, and not of high quality.

SUPERB may be confidently recommended for the family garden, for persons who desire high quality, since it is very large and abundantly productive, although too dark in color for market, and the berry is inclined to crumble in picking. It produces plants but slowly.

SURPRISE and CRIMSON BEAUTY are very similar in both plant and fruit. The former, however, has the young shoots clothed with purple spines; while those of the latter are greenish-white. In fruit, both these are quite similar to Herskine.

SOUHEGAN, Tyler, Doolittle, Hopkins, and several others among the cap varieties, have, this season, ripened very nearly together; while Shaffer is two or three days later, and Gregg several days later yet.

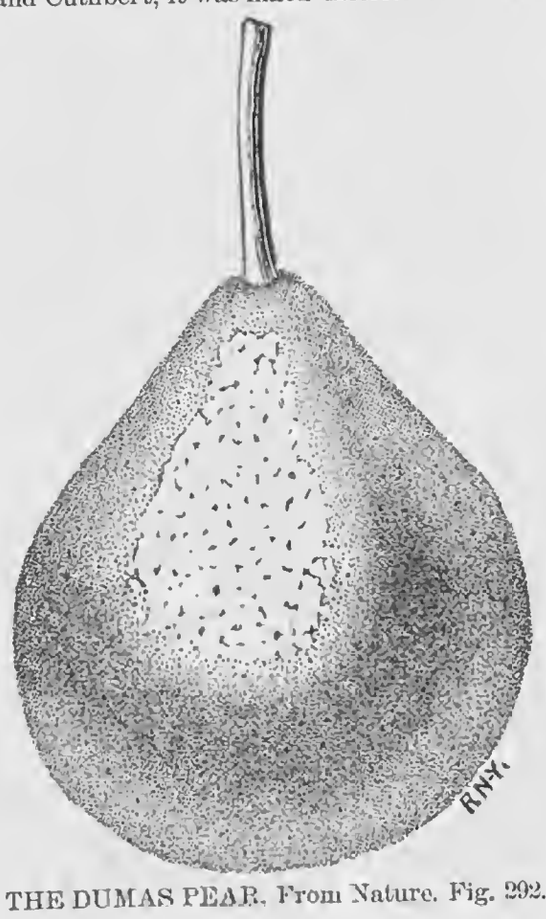
Of all the newer candidates for popular favor of this class, I regard the Hilborn as the most promising, whether for home use or market. Almost as large as Gregg, it is clear, glossy black, in flavor rich and juicy, and decidedly less seedy than any other black-cap I know, with the possible exception of the old Miami. Beebe's, like all the other "goldens" I know, although very productive, becomes offensive when a little overripe, on account of its dirty brown color, as well as its loss of flavor. Brinckel's Orange and Caroline are, so far as I am aware, the only exceptions to this rule. T. T. LYON.

MARLBORO RASPBERRY IN CONNECTICUT.

THE experience with the Marlboro on the Rural Grounds is similar to my own. Being one of the original shareholders of the berry, I received with the young plants from Mr. Caywood, half a dozen extra plants with earth on the roots. They were planted out with care and bore some extra fine fruit the next season, and made a fine strong plant growth; even more vigorous than that of the Cuthbert. In the season of 1884, what few plants we left for fruiting were well loaded with fruit that ripened early, was of fine large size, bright color and firm.

Last year the plant growth was weak and sickly, and the fruit crop a failure. This season the plant growth is even poorer than last, and, side by side with a dozen or more red varieties, new and old, the Marlboro is the poorest of the lot, the plant growth not being equal to that of the Hansell, which is a very poor grower.

Mr. C. C. Hort, of Southington, reports that the Marlboro is in much the same condition with him. And on a recent trip through the West, I failed to find a single plant of it showing the health and vigor of which it gave promise two years ago. Mr. C. A. Green and some others report that it is doing remarkably well near Rochester, New York; while F. H. Hillenmyer, of Lexington, Ky., told me that, side by side with Turner and Cuthbert, it was much inferior to either.



THE DUMAS PEAR. From Nature. Fig. 292.

I am sure we must look beyond the Marlboro for a valuable early market red raspberry.

South Glastonbury, Ct. J. H. HALE.

Miscellaneous.

THE DARK SIDE OF FARMING.—IV.

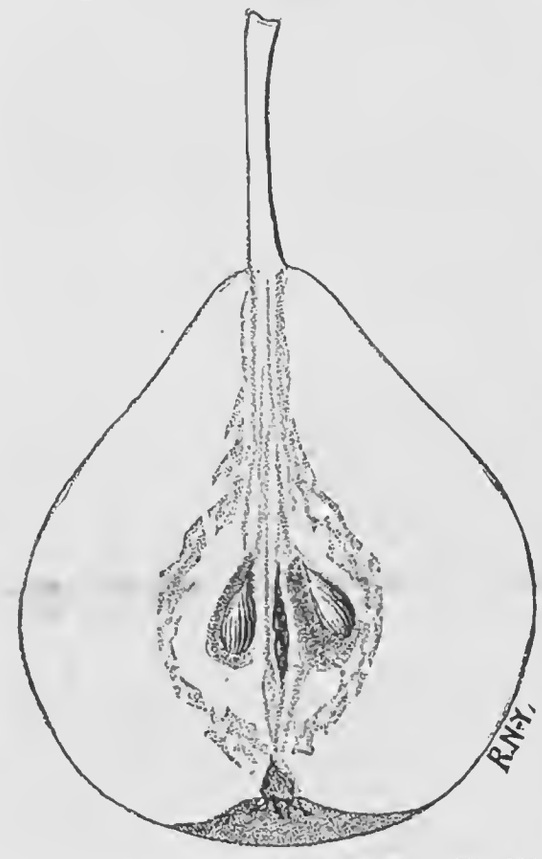
HENRY STEWART.

"ALL delays are dangerous" says one author, and another says "delays have dangerous ends." This is especially true of farming—of all work, of sowing and reaping, and in regard to live stock and the dairy, and all domestic arrangements. Disappointment, loss, vexation and infinite trouble come to the man who procrastinates, and his family suffer with him. Surely a man of this character is a misfit, and being unfitted to his work and place, everything goes on harshly and disagreeably and brings misery. There is no darker side of all the infinitely varied sides of life than such a one as this to the man who lives in this manner. To him and his it is

"Dark, dark, dark, amid the blaze of noon,"

and everything in nature—the blooming Spring, the kindly, genial sun, the gentle rains, the singing breezes, the Winter's snows, the storm which howls out of doors and makes the warm, well-lighted and snugly-draped parlor of the successful farmer all the more cheerful and pleasant by the contrast, and which pleases this man when he thinks of his work all done outside and his stock all warmly sheltered in good barns and beds and well fed, and he draws to the blazing fire and sees with pleasure and contentment his happy, beaming wife, and the girls and boys, with their books and papers, all enjoying the warmth and the bright light in their happy home, while the snow beats musically on the window-pane and rattles on the shutters—all these make the other man wretched, simply because they come to him when he is unprepared, and interfere with his belated work. When he wants dry weather for his spring plowing, it is rain ing. When his neighbors have their hay and crops harvested, and are rejoicing in the showers which refresh the shorn meadows and renew the verdure, he is lamenting for his over-ripe hay, drenched and rotting in the field.

Do we not know of such men? Is the character overdrawn? Alas, no. "'Tis true, 'tis pity, and pity 'tis 'tis true" that thousands of farmers live in unhappiness and poverty simply because they are behind in everything they undertake. They are not lazy or indolent. On the contrary, some of them work harder than any other men; they double their own loads, while they weaken their ability to bear them. Just now as I write I can look over the field of a neighbor who is mowing down weeds in his field of young corn. They have grown so with the excessive rains that they hide the young plants. His late-planted corn last year was caught by the frost. He took his seed out of the crib; frozen while damp in the crib, it did not grow; he replanted and replanted, and when the neighboring early planted fields were worked and hoed, his corn was not above ground, and then the rains, which pushed on the former, only retarded his, and his seed rotted in the ground, and he had a poor stand, and the weeds grew until to-day he is mowing and raking them off to find his rows of corn. What an excess of labor, and what a poor reward he has for his quadrupled work! He is dispirited; you cannot get this man to laugh; the lines of his



THE DUMAS PEAR. Cross Section. Fig 293.

face are drawn down, and he looks careworn and unhappy. He lives on the dark side of farming, and no sunshine brightens his heart and lightens his labor. He is a good, honest, truthful, kind-hearted man, for whom one cannot help being sorry, and the pity of it is that most of these easy-going, unhappy men, who are their own enemies, really evoke our sympathy, and while we see their faults we are sorry for them and want to advise with them and remonstrate with them. And this we should do by a word in season, by kindly expostulation, and especially by example and act, which

"Some forlorn and shipwrecked brother,
Seeing, may take heart again."

THE MEAT SUPPLY OF NEW YORK.

HAVE you any clear idea of the amount of stock slaughtered to supply the demands of a city of a million and a quarter population like New York? Well, the receipts of live stock at the slaughter houses here last week, exclusive of stock for export, amounted to 9,274 beeves, 7,213 calves, 35,223 sheep and lambs and 27,290 hogs, besides a vast quantity of poultry; and last week the receipts were unusually small, owing in great part to the torrid heat, as butchers do not like either to stock up heavily or to kill in very warm weather, and shippers, therefore, hold stock back so as not to glut the market. Large quantities of meat are also shipped in the carcass from near-by slaughtering points; but the heaviest shipments come from Chicago. Four large houses contribute nearly the whole supply from this source. Swift & Co., slaughter weekly in Chicago for the New York market 2,500 steers; Armour & Co., 2,000; Hammond & Co., 1,500, and Nelse Roberts about 1,000. These figures are given by William Ottman, one of the most extensive and best posted butchers in the city. Swift & Co. supply meat both to retailers and consumers (at different prices, of course); but the rest deal almost exclusively with local butchers, most of whom sell the Chicago dressed meat as home-killed. They have all large depots with huge refrigiators in different parts of the city; though the headquarters of the trade are at Washington Market.

The National Consumers' Meat Company is a new competitor for the dressed meat trade here. It proposes to deal directly with consumers without the intervention of middlemen, and by saving the profits made by these it professes to be able and willing to sell beef to the public at a price 20 per cent. below the figures of any other dealer. It is the agent of a large number of cattle companies and barons on the Western ranges, and it proposes to deal exclusively with the producers of the West and the consumers of the East. Oliver Sumner Teall, President of the company, is also president of nearly all the Western companies that supply the meat. General Manager Hammond has been extensively engaged in the dressed meat trade for years, and the company has already in successful operation 12 large shops in Baltimore, and has leased for five years three large depots in this city, intending to open more so soon as the growth of the trade shall demand the extension.

The prices will not vary with the season, as the Company believes that a fixed rate the year round will prove more satisfactory to its patrons. The Company will also supply mutton, lamb and pork as well as beef, and also poultry and everything else found in first-class butchers' shops. The concern has already constructed enormous slaughter-houses for the use of the combined cattle companies at Medora, Dakota; Kansas City, Mo.; Silver City, New Mexico; and Victoria, Texas. The cattle will be taken from the ranches of the various companies to the slaughter-houses, and the dressed meat will be promptly forwarded to this city in refrigerator cars, the transportation taking from five to eight days.

It is said by the large butchers here, as well as by the representatives of the Chicago shippers of dressed meat, that the new enterprise must speedily fail. There are now three different grades of beef in this market, and they say the far Western article will be a fourth. The first is the very finest grade of meat from the corn-fed steers of Missouri, Illinois, Southern Indiana, Kentucky, and Ohio. This meat is quoted in to-day's market at as follows: Prime sirloins, 24c. per pound; prime roasts, 18c. to 20c.; corned rumps, 12c. to 14c.; *a la mode* pieces, 14c.; chuck roasts, 12c. to 15c.; briskets and navel corned, 5c. to 8c. These are the meats supplied to the first-class clubs, hotels, restaurants, and private families. Ordinary retailers furnish a second-class article to boarding-houses and families, charging from 10 to 15 per cent. lower rates. Swift, Armour, Hammond, and Roberts, of Chicago, sell their refrigerator beef lower still, and the new company proposes to undersell these 20 per cent. All the company's beef will be from grass-fed range cattle, nearly all coarse brutes of the Texan type. The meat, it is said, will be stringy, with little fat or very rich matter, and will never find its way to first-class tables. Again, it is asserted that Swift, Armour, and the others, in spite of the enormous quantity of stock they buy, work on a very small margin (not over $1) per head, and that if the new company undertakes to undersell them, it must do so at a loss, which will prove ruinous in a short time. Last Tuesday, however, the company started two of its depots here, and will open the third within the week, and the managers stoutly maintain their ability to fulfill their promises.

The competition in the Western dressed meat is serious matter for the stock raisers of the Eastern and Middle States. Hitherto the discrimination against the trade exercised by the railroad companies has prevented, to a great extent, the depressing influence of the business on the prices of Eastern and Middle States stock, still a very considerable lowering of prices in the East is due to it; while it does not appear to have in the least raised the prices of Western stock. If the new company really fulfills its promise to sell meat at 20 per cent. lower than the other dressed meat dealers, the depression must soon tell on the prices of at least the poorer classes of Eastern and Middle States cattle, and to a smaller extent on the figures for other kinds of stock, for a low price for beef is sure to force down the prices for other meats also. This will be the case not in this market only, but in those of all the other places now supplied with Western dressed beef; for the increased competition is pretty sure to extend to these also ere long.

CATALOGUES, ETC., RECEIVED.

PETER HENDERSON & Co., 35 & 37 Cortlandt St., N. Y.—A summer catalogue of celery, cabbage, cauliflower and pot-grown strawberry plants, with a list of turnip seeds, and etc. The celery plants will be supplied in any quantities up to August 25; the pot-grown strawberry plants up to September. The new strawberry Crimson Cluster is offered for the first time. It has been fully described in the

R. N.-Y, as the "King Cluster of Durand," the originator. Judging by the claims made for this new berry, it is little short of perfection in every way. The catalogue will be mailed to all applicants without charge.

COTTON-WORM AND BOLL-WORM.—Fourth Report of the U. S. Entomological Commission.—This voluminous and finely illustrated report is entirely devoted to the history and habits of the above-mentioned insect enemies of the cotton plant. The various remedies known to science are well described and illustrated.

JOURNAL OF FISH CULTURE.—The first number of the above publication is at hand. It is to be published each month. Office at Philadelphia; price, $1.50 per year. The paper is issued under the auspices of the American Carp Cultural Association and edited by Milton P. Pierce, who is to-day the best posted man in the country on matters pertaining to carp culture. The new publication has a most admirable opportunity to fill a somewhat neglected field. Thousands of farmers are interested in the culture of carp, and reliable information as to the best conditions for propagation and the quality of the fish, is apparently hard to obtain. The new journal ought to do much good.

DEPATMENT OF AGRICULTURE.—Report for 1885 from Commissioner N. J. Colman, Washington, D. C.—This volume contains the reports of the Commissioner, Botanist, Chemist, Entomologist, Statistician and other officials connected with the Department of Agriculture. To the agricultural student, the facts, figures and experiments recorded are of great importance. The volumes are intended for general distribution, and farmers should avail themselves of the opportunity offered of seenring a copy of the report by applying for it to the Congressmen for their respective Districts or the Senators for their States.

WINTER CARE OF HORSES AND CATTLE. By T. B. Terry, published by A. I. Root, Medina, Ohio. Price 40 cents—This is one of the brightest and most readable additions to farm literature that we have ever read. It ought to be read by every farmer in this country. The subject is one of the most timely of all farm topics. It is always seasonable. When we are not actually engaged in handling cattle, we are busy preparing for the work. Both the raising and the feeding of stock-food are subjects of vital importance in modern agriculture. It is hard to say which is most important. Mr. Terry is a successful farmer. His success gives him confidence and enthusiasm, which crop out in the pages of this little book. We feel that these ideas are from the head of a man who "knows what he is talking about." He knows that stock must be kept comfortable in Winter. How true it is that thousands of farmers try to batten up cracks in the stables with grain and hay. We have decided opinions regarding the man who can sit near a comfortable fire without any thought of his cattle, that are shivering in a broken and windy barn. Mr. Terry discusses the use of stanchions for confining cattle. He concludes that cattle are satisfied with this method of fastening when they are well fed and carded, kept well bedded on a tight floor, and made warm and comfortable. Where they are placed on a slippery floor with great cracks in it, and where the wind comes in on them, the stanchion is a barbarous affair. It simply holds the poor brutes in the cold, where they cannot move about and warm themselves. The objection frequently urged that cattle cannot lick themselves when confined in a stanchion he would obviate by a thorough carding. For dairy cows he would have stanchions with a slightly sloping floor, and a gutter two feet wide and eight inches deep, that will hold manure for several days, so that in stormy weather the stock need not be turned out every day while the stable is being cleaned. There is far more satisfaction in carding a nice lot of thrifty cattle than there is in running the card over poor stock. Carding pays on cattle as well as it pays on horses. Anything that adds to the comfort of an animal adds to its value. Regularity in feeding is absolutely necessary to insure success. When the farmer is in the habit of throwing down a forkful of hay every time he goes to the stable, the cattle will become uneasy and jump up every time a person enters the barn. If they know just when their feed is coming they will be satisfied to wait till the proper time comes. Contentment is everything. Mr. Terry seems to think that the ordinary "chores" around the barn require more skill to do properly and well than almost any other branch of farm labor, and yet the work is always shirked, and the idea is general that any cheap boy, working for his board, is able to attend to the labor. Speaking of Sunday work, Mr. Terry says if you cannot get to church and give your stock their usual care and feed, you had better stay at home. If you hire some one to do the work and keep him at home, you do no better. We are advised to "speak to a cow as we would to a lady." Kicking cows are trained to evil doings by abuse or harsh words. A member of the church in Ohio boasted that when his cow kicked he took a trace out of the harness and pounded her till she begged. When cows come home from pasture on the run, with a dog at their heels, and when at milking time one can hear the sound of a milking stool falling on their hips and ribs, Mr. Terry does not wonder that "dairying does not pay." We would gladly print half the book if space would permit us to do so. We can heartily recommend it to our readers as the work of a thoroughly practical, humane and gentlemanly farmer.

What Others Say

FEEDING EXPERIMENTS.

PROF. SHELTON, of the Kansas Agricultural College, conducted a series of interesting experiments last Winter. The results are contained in the advance sheets of his yearly report—just issued. The main object has been to present facts without much attention to underlying theories or to the opinions that might reasonably have been formed. Prof. Shelton rightly states that these facts will prove useful just so far as they receive intelligent application. The unthinking adoption of experimental facts is as bad as the thoughtless rejection of the same. The professional experimenters should suggest and work out the groundwork that farmers may fill up with facts and observations from farm practice. This idea appears to us sound. Farmers do not care for opinions, but they desire simple facts which they may test to their own satisfaction.

Two years ago Prof. Shelton sought to determine, by feeding trials, the relative feeding values of corn meal and corn-and-cob meal. This question is of great importance in Kansas, in view of the vast corn crops of the State, and the narrowing margin of profit in feeding. Two years ago it was found that cob-meal gave the best results, taking cost into consideration. Last year there was a slight difference in favor of the clear corn meal. Two circumstances helped to bring about this result. The Winter was particularly long and severe, and the steers fed were in far better condition than those fed during the previous test. Two years ago the cattle were a lot of thin, half-grown natives, while last year high-grade Short-horns were fed. In the first lot the gain was largely in growth of bone and the coarser parts, for which it would appear that the cob-meal was well suited. The use of cob-meal in feeding a large herd of cattle, not as an experiment, but for practical results, has satisfied Prof. Shelton that it is a valuable food. It is more completely digested than the clear corn; it is eaten with as great relish, and cases of diarrhœa were practically unknown; cattle were seldom "off their feed" when fed upon the cob-meal. In order to obtain the best results, the cobs and grain must be ground into a powder. Too many feeders break the cobs into coarse pieces and then condemn the feed because it gives poor results. The great objection to the cob-meal lies in the fact that it is almost impossible to obtain a mill to grind it properly. Of five different mills tried at the Kansas College, not one has given complete satisfaction. The power that could shell, fan and grind 200 pounds of clear grain in 20 minutes, could grind only 77 pounds of cob and grain in the same time, and the mill was so greatly heated that a stop was necessary. If a mill can be produced that can economically reduce the whole ear to a meal there seems no doubt but that the use of cob-meal will be greatly increased.

IN feeding cooked corn and raw corn to pigs the advantage was decidedly with the latter. The corn was cooked by steam in a barrel, to which a pipe was run from the boiler. It was so thoroughly acted upon by the heat that each grain could be easily crushed between the thumb and finger. During the coldest weather the cooked corn froze in the troughs, often before the pigs could eat it. This objection has always been noted in cases where cooked feed has been given in cold and exposed pens or houses. It required 7.5 pounds of the cooked corn to make a pound of increased weight, while 6 3 pounds of raw corn produced a pound of increase. Every detail of the experiment goes to confirm the opinion that nothing was gained by cooking the food; that the trouble and expense were given for nothing. The result might have been different with younger animals, where the gain would have been chiefly in growth, but there is little evidence to prove this belief. Experience during this experiment shows that corn, while an easily accessible fattening food for mature animals, is, for young growing pigs, literally a starvation diet.

EIGHT good eight-months shoats were turned into a pasture of an acre and a half. About one-fourth of the pasture was covered with Alfalfa. The remainder was Orchard Grass with a slight admixture of Alfalfa and Red Clover. The pigs were almost "fat" when turned in. They lost in 25 days 125 pounds. The grass would keep them alive, but it would not "hold" flesh made from corn. When fed two pounds of ear corn daily apiece the pigs gained. This experiment shows that Orchard Grass is not profitable to use as a hog pasture. That point has long been admitted by hog raisers. The pigs ate the Alfalfa and clover to the ground, but the Orchard Grass was always luxuriant and abundant. The Alfalfa was so closely grazed that it was entirely destroyed, only a few plants showing life the following season. Where an ample range is permitted, however, there will be no danger from this trouble.

WARMING the water for dairy cows gave most satisfactory results. Common well water raised to a temperature of 80° was used at first. After a few days it was raised to 90° and even to 100°. The cows at first were reluctant to drink the hot water. It was found necessary to delay watering until the cattle were very thirsty. After two or three trials the cows became greedy for the warm drink, and would rush eagerly to it. A total increase of over eight per cent. in the milk product was noticed as the result of drinking warm water. One bushel of coals burned in an economical boiler was found to be ample fuel for heating the daily drinking water for 25 cows. Prof. Shelton suggests a most excellent use for that ever abundant farm product—woody fiber. It is found in spoiled fodder, stalks, cobs, etc. It is of small importance as food, but when in a suitable condition to burn, may be used in heating the drinking water. It is cheaper to warm an animal in this way, than to try and warm it by feeding the more expensive animal foods.

"IS THERE DANGER OF BREEDING ANIMALS TOO EARLY?" asks the National Live Stock Journal. In our desire for the progeny of valuable animals, are not their reproductive organs too often over-taxed, injuring the parents and weakening the offspring? It is often contended that the natural desire for reproduction is sufficient evidence of the fitness of an animal to perform that office. Of course, this must be the rule in the state of nature; but Nature is prodigal in her processes. How many seeds does she scatter for one that bears a mature tree or plant! But our animals are not in a state of nature, and this fact is too often lost sight of in drawing inferences from the condition of wild animals as to what should be the treatment of tame ones. Our domestic animals are subjected to a sort of pot-house growth and development, and judged by the natural standard, everything about them is immature. They come unnaturally early to maturity because man finds his profit in their precocity. Man, not Nature, is largely a law to our domestic animals, and there is no doubt there is danger that in his desire for gain he runs a risk of breeding animals too young, and thereby gradually weakening the constitution and reducing the size.

OLEOMARGARINE NOT WHOLESOME.—We learn by a telegram from Albany, N. Y., last Thursday, that the forthcoming report of Dairy Commissioner Brown goes far towards establishing, on the authority of Dr. R. W. Clark, Chemist of the Department, a constitutional right of the Legislature to enact a law prohibiting the manufacture of oleomargarine and spurious butter. The Commissioner says that the oleomargarine manufacturers made the law a nullity by persuading the courts to decide that the Legislature exceeded its authority when it forbade the manufacture of imitation butter, holding that its manufacture had not been proved prejudicial to health. Now victory, he says, is within the grasp of dairymen, as the Chemist of the Department has pronounced oleomargarine "unwholesome and dangerous to health." In this report Mr. Brown will say: "First, that oleomargarine is indigestible; second, that it is insoluble when made from animal fats; third, that it is liable to carry the germs of disease into the human system; and, fourth, that in the eagerness of manufacturers to produce their spurious compounds cheaply, ingredients enter into its manufacture which are detrimental to the last degree to the consumers' health."

NOTHING COMES FROM MUMMY WHEAT—We do not hear very much in these days of mummy wheat and barley, but many people firmly believe that the seeds of both plants found with Egyptian mummies, and supposed to be 3,000 or 4,000 years old, will sprout up if put in the ground. A few years ago what was claimed to be such wheat was commonly sold as a curiosity, and we believe that many purchasers succeeded in raising a small crop from it. Prof. Bentley, who has recently commenced a series of lectures on the physiology of plants, asserts most emphatically that no grains which with certainty have been identified as contemporaneous with the deposit of the mummified corpse have ever come to life. In cases where the so-called mummy wheat has germinated it has been introduced into the coffin shortly before or at the time of discovery of the body. Prof Bentley does not name a limit to the time during which seeds retain their vitality; but he thinks it is not generally over a few years.

THE BUREAU OF ANIMAL INDUSTRY.—The Department of Agriculture has obtained from Congress an appropriation of $100,000 for carrying out the provisions of the act of May 29, 1884, establishing the Bureau of Animal Industry. The Commissioner is authorized to use any part of the sum he may deem necessary or expedient, in such a manner as he may think best, to prevent the spread of pleuro-pneumonia, and for this purpose to employ as many persons as he may deem necessary, and to expend any part of the sum in the purchase and slaughter of diseased animals wherever, in his judgment, it is essential to prevent the spread of the disease from one State to another. The expenditure of last year's appropriation was limited to matters authorized by existing legislation (which confined the work mainly to investigation, of which there had been an ineffective excess), whereas the present appropriation may be expended, in part, to carry out the conclusions from the past investigations, by slaughtering animals where the disease is liable to spread from one State to another. While a considerable minority of those interested in stock raising believe that the dangers from contagious cattle diseases have been grossly exaggerated by the Bureau of Animal Industry for selfish purposes, and that the appropriation of even half the above sum would be excessive, the majority of cattle owners think the labors of the Bureau praiseworthy and even the present appropriation altogether insufficient. Speaking for these, the Breeder's Gazette says the present legislation is not enough. There is nothing said about the purchase and destruction of animals which have been exposed, but are not yet diseased, whose destruction is necessary to prevent a recurrence of the disease: there are no provisions relating to condemnation; no additional authority to secure inspection or to enforce quarantine, and, finally, there is but a meager allowance with which to carry on the work.

LIVE STOCK EXPORTS.—The Treasury Department report of the exports of live stock products for May, shows the export of 42,090 cattle for the past five months, against 58,047 head during the same period of 1885, with a total valuation this year of $4,049,319, against $5,806,682 last season. Of beef products, there have been shipped during the first five months of the year $1,361,672 in value, against $1,962,843 last season; fresh meats show a decline from $4,692,012 to $3,710,266; salted and cured meats show a falling off from $1,685,228 to $914,584, and tallow from $1,455,750 to $881,240. Pork products also show a marked decline, throughout the entire list, of from $12,934,838 to $10,256,520 in bacon; from $3,033,303 to $2,261,929 in hams; of from $2,430,437 to $2,292,577 in fresh and salted pork; of from $9,362,906 to $8,472,229 in lard. The totals show an aggregate falling off in exports of beef, pork and dairy products from $40,245,765 to $32,305,791. Part of this falling off is, of course, due to diminished values, but a large proportion is the result of a diminished movement.

WHICH MAY REMIND YOU.

THE Elmira Farmers' Club, as reported in the Husbandman, prefers Silver-hull Buckwheat. Several trials with this and the common side by side, have turned largely in favor of the Silver-hull. Very thorough tillage is the best security for a full yield. Prepare the land as soon as possible.....

AN important point was made by the club that all preparation for grain should precede sowing by a few days at least, so as to give the soil a chance to settle. There is no doubt about it.....

DR. GOESSMAN asks this question: "What is the use to cut up Indian corn for fodder while in bloom and containing only 13 per cent. solids, when, by leaving it till ears are formed and the kernels are beginning to glaze, we can get 25 per cent. solids instead?".....

THE best time to cut timber is said to be in July and August, says the Weekly Press. A correspondent of the Iowa State Register has been examining the wood cut by early settlers

in the West at every period of the year, and the summer-cut has been found most lasting. The practice of the best European foresters is to cut late in June, while the bark will yet slip, and to peel the bark as high up as the log is needed for timber. The leaves are left on to further aid in drawing the moisture from the cell structure of the wood. The log is sawed 10 days after falling and dried out as rapidly as possible. In August and Winter and early Spring the wood is full of starch stored to aid next year's growth, and this helps to hasten fermentation and decay.....

THE King Cluster of E. W. Durand took the first prize at the New York Strawberry Exhibition as the berry of "greatest comparative merit." This has been purchased by Peter Henderson & Co., and is now offered for sale under the name of Crimson Cluster. It is said that every yard of row the past season yielded a quart of fruit, and that the pickers at two cents a quart averaged 25 quarts per hour or $5.00 per day.....

THE U. S. Dairyman says that the disadvantages of the ordinary system of setting milk in shallow pans for raising cream are that a longer period elapses before the skimming is completed, too much space is required and in Summer the milk becomes sour before the whole of the cream is raised.....

A MINNESOTA dairyman thinks he can winter a cow on six tons of corn silage, and that he can secure the silage for 40 cents a ton. This gives $2.40 cents for wintering a cow.....

THIS is well to know in calculating the size to build a silo, says the Dairyman. A cow should be fed from 50 to 60 pounds of silage a day, if she receives no other fodder with her ground food. A cubic foot of silage weighs 50 pounds. From this data you can readily figure out the size of the silo needed.....

PROF. SHELDON, the eminent English authority on dairy matters, calls attention to the fact that if dairymen and farmers are to be subjected to the unfair competition of imitation butter, they will be compelled by force of circumstances to follow the bad example and mix in the margarine themselves. That will be the inevitable result everywhere, comments the Breeder's Gazette, if this manufacture is not prohibited, and in a few years there will not be a pound of genuine butter for sale in the markets, and everyone who desires it will be compelled to keep his own cow or go without it. Now the general public has a right to buy genuine butter if it wants to, and the proposition to tax these imitation butters out of existence is clearly justifiable on the broad ground of public protection.....

MR. WILLIAMS, in the Orange County Farmer, speaks of a Long Island (N. Y.) farm of 140 acres under the highest cultivation. The receipts from products were last year $8,000, which will be exceeded this. The stock is wintered largely on silage. The farm supports 24 cows, eight horses and a yoke of oxen. The milk is shipped to New York—no butter is made. Mr. Alburton, the owner, keeps 100 swarms of bees. The farm is now in part given to 14 acres of potatoes, three acres of tomatoes, apple and pear orchards. Sweet corn, cabbages and garden seeds are extensively grown. There is an acre of oats and peas raised for soiling, which, the writer says, contained more food than he ever saw on one acre. The amount of manure made is large, and yet large quantities are bought.....

ACCORDING to the Rural World 60 cows patronizing a small creamery, made in January 992 pounds of butter at a cost of $165.85 for food, consisting of hay, bran, corn-meal and corn in the shock. Thus the butter cost 16 cents six mills per pound. At the same creamery six cows fed on silage, chiefly, with hay, bran and corn fodder, made 158 pounds of butter at a cost of $13.02, so that the butter cost only 8¼ cents a pound. A single case is decisive of nothing; but even one such instance should start inquiry, and a number should contribute pretty strongly towards conviction.....

SOME dispute has arisen as to the keeping qualities of butter made from cream separated by the centrifugal machines. Various tests during the past season prove that if the separator is properly used, and the cream properly handled between the separator and the churn, the butter will be firm and keep at least as well as the very best creamery butter. The machines, however, are liable to fly to pieces and the butter is liable to turn out bad, unless the operator has carefully studied how to handle the machine and the cream.....

THE cheese suitable for the English market, writes T. D. Miller, from England, to the Ontario Dairyman, Canada, must by no means be such a stiff, dead and lumpy article as English merchants complain of as coming from Canada. A loose, free-cutting cheese is what's wanted, and if Canadian factories continue to make stiff cheese, he has no doubt "States" cheese will run the Canadian out of the market. As in other matters, the great thing is to find out what the market wants, and then supply precisely that.....

EPIZOOTIC abortion among cattle has been spreading so steadily in England of late years, especially in the northern counties, that it is sought to have the malady included among the others under the Contagious Diseases Act. The great trouble is that the bulk of the farmers would not report cases, because the news might stop sales of aborting cattle and young stock from the farms where the complaint may exist.....

THE great reduction of the amount of oil in linseed and other cakes, due to the use of improved machinery and chemical processes in expressing the oil (known as new process,) has caused considerable differences of opinion in regard to the influence of such reduction in the value of cake as food. Several practical feeders in this country maintain that, as the amount of albuminous compounds is proportionately increased, the value of the new-process cake is greater than that of the old, which contained more oil. Some even say that linseed oil is not a food at all; but a purgative. Sir. J. B. Lawes, however, who has studied the subject of cattle feeding closely in experiments and practice, says: "I should certainly myself be disposed to place a considerably higher value upon oil than upon albumen, and when I purchase cake for my own use, I select that which contains the most oil."....

LIVE stock insurance has been largely practiced in several States. It has entirely collapsed in Maryland, however, by the recent bankruptcy of two organizations, and the failure of a third to report to the State Insurance Commissioner within the time allowed by law. The Commissioner attributes the failure to the fact that people were induced to insure on misrepresentations, and good faith was not kept with them. After "a fair trial of two years," a Pennsylvania company also says that "despite an honest and earnest effort," the directors "are unanimously of opinion that live stock insurance on the assessment plan cannot be made a success." There is a warning in a failure of this kind of insurance in these two States..

WHEN hogs are eating clover or green stuff, give them access to charcoal or ashes. Charred corn-cobs make excellent charcoal. Dry corn is good feed with clover, as it balances the ration.....

ACCORDING to the Live Stock Record, of Kansas City, farmers who lately marketed grass-fed hogs there didn't find the venture satisfactory. They looked well, but killed abominably; and as a result were shunned by all buyers, and were taken only at ruinous prices. The Record says that while clover is a growing food, like all grass it makes watery flesh, and slaughterers say that the shrinkage in this class of hogs is something enormous. Hence, before sending to market, all hogs should be topped off with a little corn to firm up their lard and harden their flesh. If farmers will bear this in mind they will save themselves many disappointments and no little amount of money in shipping hogs the next two months.....

THE Texas Stockman, while expressing its belief that neither cattle nor sheep will ever be so high in Texas as they have been, declares its conviction that in less than three years the live-stock interests of that State will be upon a more satisfactory basis than ever. The Breeder's Gazette thinks this a reasonable prediction since Texas has much more to gain by the adoption of better methods and the breeding of better stock than she can possibly lose through any falling off or obstruction in the Northwestern markets. All that Texas need do is to produce cattle suited for the world's market instead of for the wild ranges.....

A CORRESPONDENT of the Tribune claims that although cows will eat sorghum greedily, it causes a loss of milk and butter, so that it is better feed for fattening animals than for milch cows. Is this so?.....

"WHAT would he thought if we were to walk over our bread and butter?" asked the witty Sidney Smith, speaking of cows grazing on pastures. Doesn't the cow's tread often destroy a good deal of feed by poaching on wet pastures?.....

Everywhere.

TRANSCONTINENTAL LETTERS.—LVII.

MARY WAGER-FISHER.

The Sacramento Valley; large and small ranches; Senator Stanford's Vina ranch; its management; Marysville.

THE Sacramento is one of the largest and most important interior valleys in California, and we rode through the entire length of it by rail in daylight, seeing it in its least attractive phase—after the long drought of the Summer, and before a drop of rain had fallen. Leaving Red Bluff—which is at the head of navigation on the Sacramento River—on the morning of Oct. 28, we rode for some time through what are called the Red Lands, from the color of the soil, and which produce fine wheat without irrigation. We were told that ten years ago this land was regarded as worthless—another illustration of the futility in calling any land worthless, simply because its value has not yet been ascertained. The level fields were dotted with oaks, and to the north rose the isolated peaks of Lassen Butte. The farm-houses were white, with green blinds, and a water-tower with a wind-mill formed a part of the out-buildings of every ranch. Horses were frequently seen pasturing in the wheat stubble—always tall, as the wheat is "headed."

As we desired to journey on the east side of the river, we left the "through train" for San Francisco at a station called Tehama, where the railway branches for each side of the river. At this point we boarded a freight train which had a caboose attached; but we preferred seats in the baggage-car, from which we had an excellent outlook, and after a party of Indians had left the rear platform, we took possession of that, and were as finely stationed for sight-seeing as we could have desired. (In most, if not all, the cis-Rocky Mountain States, the Indians are allowed to ride free in the cars, but are not permitted in the passenger coaches. This free riding is in consideration of certain privileges accorded to the railroads by the Indian Reservations through which the route lies.) We rode that day as far as Marysville, which town we reached at nightfall.

The Sacramento Valley is probably from 40 to 60 miles wide, and so far as we could see, it was one stretch of level land. Some of the largest and finest farms in California are here, and large ranches are generally regarded as hurtful to the best development of the State. They indicate large financial resources, and "respectable yeomanry avoid regions of immense wealth." A small farmer occupies a social position in comparison with the large farmer, very similar to that which the "poor white trash" in the South enjoyed in comparison with the planter. A small ranch consists of from 200 to 300 acres; a large one numbers its thousands of acres. One of the most notable of the large ranches we rode through is called Vina, and is the property of ex-Governor, now Senator Stanford, and consists of about 37,000 acres. I believe it is a part of the property which has since been included in his magnificent endowment for the Stanford University, which he has founded in memory of his dead young son. Nearly 4,000 acres of it are planted with grapes, which are made into wine on the premises. The products of the ranch are diversified: there are wheat, oats, barley, alfalfa, potatoes and fruit. The entire property is supplied with irrigating ditches, and the farming is of the finest character. Apple and fig trees are planted along the ditches. This ranch was in the line of devastation made by the grasshoppers last Spring, and we saw acres of wheat and of vineyards that had been stripped; but many of the vines were re-leafing. One of the railroad men said that the "hoppers" impeded the trains, their crushed bodies on the rails making them too oily for the car wheels to move on them. The damage done by them was very great and was fully reported in the newspapers at the time. Wheat is produced at an average yield of 30 bushels to the acre, and was selling at that time at what was regarded as a good price—$1.36 per 100 pounds. The wheat is thrashed in the field, put in sacks and lies on the ground until sent to market—as there is no danger of rain. On Mr. Stanford's ranch, I was told, are employed two superintendents, 75 whites, and from 200 to 300 Chinamen. The plowing is done by horses—steam plows being generally discarded—and the plowing we saw being done was by means of a sulky plow drawn by six horses. Four to six horses were used in harrowing. The land is valued at $100 per acre and taxed at a valuation of about $30. We were assured that the tax was invariably higher on small than on large ranches, which is probably true. Board fences are used and locust largely planted for shade trees, while the native oaks, beautifully scattered over the valley, have in large part been allowed to stand.

What is true of Mr. Stanford's ranch is equally true, with modifications, of all the other large farms we have seen in the State. So long as these large possessions remain intact the country will not increase in population where they are, and any movement that tends to their division is regarded by the people with satisfaction. Of course, in time they will be broken up, as the law of primogeniture does not hold in the United States, and the sons of rich men are not proverbial for their retention of riches. I am told, too, that farming on so large a scale has not been found profitable, and the recent numerous failures among farmers in the rich and fertile San Joaquin Valley are in large part attributed to too much land, the payment of interest on mortgages, which have eaten up the land itself.

Except for the remoteness of habitations, nothing could appear more prosperous and beautiful than this valley, under such admirable cultivation—"orchard fruits and fields of golden grain." But it is a general verdict that irrigation breeds malaria where the heat is so intense as in these inland valleys. At nightfall the dusky landscape was illuminated by burning stubble, which looked like so many prairie fires. Everywhere the dust lay thick, and however others may like rainless Summers, I am very free to confess that "I and my house" like a land of summer showers. It was half-past six when we reached Marysville, which town, as everybody knows, was a great point in the early mining day, when 50 stages daily left it for various "diggins." It lies between the Yuba and Feather Rivers, and is dyked to preserve it from the inundations of these streams. We had a fairly good dinner, and the waiter told us facetiously that the cook was a Frenchman from Hong Kong! He also ventured some comment on the weather, saying that the mercury rose in the Summer in the house to 120°, and that the water they drank came from the Feather and was very good, except when the "slickens" got into it, and "slickens" were washings from the mines. Before retiring, we each took a quinine pill, as we generally do when in malarious districts, and mine, as usual, stuck in my throat, while the laddie washed his down with laughter!

RURAL SPECIAL REPORTS.

Canada.

QUEBEC, Province of Quebec.—Owing to an early Spring, crops were put in fully two weeks earlier than last year, and although May was rather cold, all crops are looking remarkably well. Turnips and potatoes large crops. Hay and oats promise large yields. The pasturage is better than for many years, consequently milk and butter are plentiful and cheap. All garden truck doing well and much earlier than last year. Wild strawberries were in market June 25. Sharpless are of fine size. The blue plum and apple crops promise large returns. W. M. M.

Colorado.

LONGMONT, Boulder Co., July 5.—The prospects for crops in my immediate neighborhood are: corn, not so good by 10 to 20 per cent.; wheat, short by 20 to 30 per cent.; oats, ditto by 20 to 30 per cent.; barley, about on an average; potatoes, short by 40 to 50 per cent; garden truck, an average; apples, abundant; pears, not any. No peaches grown in this part of Colorado. Grapes and all small fruits full crops; hay ditto. R. S.

Indian Territory.

CADDO, Choctaw Nation, July 5.—Corn is very promising: acreage much larger than last year. I think the general average will be about 30 bushels per acre. Wheat and oats not good, owing to too dry weather last Spring—about one-fourth of a crop. Irish potatoes, half crop; sweet potatoes, very promising, and they are grown extensively here. Garden truck, such as cabbage, beans, peas, onions, etc., good; plenty for home consumption. Apples, peaches, pears, half crops. Grapes, more especially wild grapes, grow in abundance, and a better prospect I never saw. There is but little tame hay grown here, as we have such an abundance of wild grass. Stock of all kinds look fine and fat. Cotton very promising at present, though the stand is not good, owing to dry weather in Spring. Sorghum is grown to some extent—enough for home consumption, and it is very promising. F. B.

Michigan.

BEAR LAKE, Manistee Co., July 3.—We are having the worst drought for the time of the year, that has ever been known in this part of the country. Grass is entirely ruined, so there will be no hay, and wheat will be less than half a crop. Oats cannot hold out much longer against the scorching sun that sends the mercury up above 90° in the shade. Potatoes and corn planted three and four weeks ago, are still in the ground as dry as when first planted. Six weeks without rain mean hard times, not caused by "over-production" this season. Butter is worth 12 cents per pound, and eggs 12 cents a dozen; potatoes, 30 cents a bushel; oats, 45 cents and wheat 74 cents. M. E. A.

Minnesota.

VIVIAN, Wascca Co., July 5.—Soil deep, moist and rich. The latter part of April was warmer than usual. Crops put in well and

early. Weather in May as good as could be. Most of the time since June 1 it has been dry, hot and windy. Wheat leaves are rusting. Wheat, oats and barley must be light. All crops are suffering for want of rain, especially potatoes. Alaska Peas no earlier than American Wonder. Angel of Midnight Corn now ready to tassel; two feet high. Dent corn twice as high and as forward. Corey sweet corn silked July 29th. S. K. O.

Nebraska.

RUSCOE TOWNSHIP, Buffalo Co., July 9.—Our Spring was very backward. We had an unusual fall of snow on March 27th and 28th, and on April 2, 3 and 4, which remained for two weeks. We had considerable rain in April, and but little in May. In June we had no rain worth speaking of. We are just passing through a very severe dry spell, and unless we soon get rain the growing crops will be materially damaged. The following estimate of the crops in this section is given as compared with the condition at the same time last year:—Rye 100per cent.; barley 90 per cent.; wheat 80 per cent.; corn 70 per cent.; hay 70 per cent.; oats 50 per cent.; potatoes and garden truck about the same as last year, except that they are suffering from lack of rain. If we have plenty of rain this month the hay crop will reach 100 per cent. B. B. M.

New York.

ELMIRA, Chemung Co., July 3.—No rain to wet anything more than the surface since the first week in May here. All crops are suffering from drought. Corn came up very unevenly, owing to this cause and poor seed, and the stand is poor. But few fields in which there are not a great many missing hills. The use of corn planters has not proved favorable with me this season. That covered with a hoe came up much better. Wheat, with the exception of grain injured by floods on the river bottoms, came through the Winter better than last year and started finely, but has not done well since, and a great deal of it is very short in growth. The best pieces I know of are of Diehl-Mediterranean. Oats are heading out very short and will be a poor crop unless rain comes soon. Rye good; barley looks well, but there is not much of it. Early potatoes badly injured by drought; bugs plenty. Early in the season there was a good prospect for a hay crop, but it has all vanished and the crop is the poorest in many years. It is a rare thing to see a heavy meadow even on the river bottoms. It has been a hard season to set tobacco, of which there is a great deal sown about here. Where they have succeeded in getting a good stand of plants it is looking fairly well, and there is time enough yet to make a good crop if the balance of the season is favorable; good prospect for apples.

J. D. M.

North Carolina.

WALNUT COVE, Stokes Co., July 7.—We have had almost continual rain for nearly six weeks. The land has not been dry enough to plow since May 10. Crops have been "worked in mud," and some of the corn has not been plowed the first time yet. The excessive rains in May almost ruined the wheat crop with rust and scab, reducing it at least one-half, and now the continued rains since harvest have sprouted in the stack not less than one-third of the grain, consequently our farmers are asking, "Where will we get seed wheat?" We have had more rain during May and June of this year than we have had since "the rainy Summer of 1832." My patch of Johnson Grass stood a test of 10 degrees below zero the last Winter, and is now a finer growth than last year. I have a nice little patch of Angel of Midnight Corn, and I am going to try for the premium. R. P. McA.

Oregon.

AMITY, Yamhill Co., July 1.—Weather dry but pleasant. Have had a very cool, backward Spring. Winter wheat promises a full yield on over an average acreage. Rye the same. Spring grain of all sorts will be light on account of unusually dry, windy weather. A great deal of late potatoes are rotting in the ground after planting. Other garden vegetables look healthy. Fruit will not be so plentiful as usual. Some varieties of pears and plums will be almost a failure, while others will bring a full crop. The same may be said of apples. Cherries are abundant. Hay will be short, the pastures appear good, and stock looks well. Wheat is worth 60 cents; oats, 33 cents; rye, 50 cents; barley, 40 cents; new potatoes, 50 cents. J. C. R.

SHEDD, Linn Co., July 2.—We have had an unusually dry season; consequently crops are a little short. Fall wheat, 75 per cent of last year's crop; acreage about the same. Oats about the same as last year in yield and acreage. Barley a light crop—not much raised in this part of Oregon. Not much corn raised here—only for roasting ears. Only one-fourth of the usual crop of potatoes planted, but they are looking well. Gardens generally look well; apples, half a crop, owing to late frosts; pears, full crop; plums and prunes, short crops; cherries, full; small fruit, such as blackberries, raspberries and currants, heavy crops. Owing to the low price, only about a third of the hop yards were cultivated. Timothy hay, one-half crop; chess or cheat hay, a large crop. Grapes, very full, and looking fine. Spring wheat, 75 per cent. acreage, 65 per cent. of last year's. We are having a fine rain to-night. I fear it will spoil a large amount of hay if it continues long. P. W.

WALLA WALLA, Walla Walla Co., July 3.—The outlook for wheat—the main crop of Eastern Oregon and East Washington Territory—is not nearly so good as last year at this time, not having had sufficient rains. Many fields are looking fine, and upon the whole there will be an average crop, but last year we had an extra good yield of wheat and barley. Potatoes look well. Corn good—better than last year. The Angel of Midnight is growing as if it had wings—it stands from five to six feet tall already. Fruit prospects ahead of last year's, especially for pears, plums, peaches, etc. Some of the early strawberries were injured by frost, but the later varieties yielded well. Raspberries and blackberries about the same. Our Evergreen blackberry vines are loaded with fruit about two-thirds green; some of the young plants have made a growth of over 10 feet this season.

C. L. W.

Texas.

DENISON, Grayson Co., July 4.—Denison is the largest city north of Dallas in this State. It has continued to grow, and has been quite lively all through the strike and dull times. It is now putting in $200,000 water-works, as well as electric lights, and has recently secured the two other long lines of railroad to be speedily built across the Indian Territory, in addition to five trunk lines already centering here. It has gas, an ice factory, two telephone exchanges, and two telegraph companies, round houses, car factories, a cotton compress, foundry, machine shop, etc., and a magnificent system of graded public schools. The place has 12,000 population, and pretty much all modern city airs and conveniences. T. V. M.

Wisconsin.

GREENBUSH, Sheboygan Co., July 6.—We have not had a good shower since April 25. Not much wheat raised here. Oats and barley can't be more than half crops. Some corn has not come up yet; what was planted early came up well, but is now rolled up, owing to the dry weather. Unless we have rain soon, we will not have any corn or potatoes. Frost killed the cherry blossoms, and the dry weather is injuring small fruit. Apples are dropping. The thermometers stand 106 in the shade; wind in the east and south most of the time.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

A NEW INSECT ENEMY OF WHEAT.

A. S., Level, Md.—What is the green, brown-headed worm (specimen inclosed) which has been devastating many fields hereabouts? It began its destructive work soon after the grain was formed and continued it till the stalk was hard. It ascended the stalk to a point near the head, where it cut the stalk quite through, allowing the head to fall to the ground. Then, climbing until its head and half its body rose above the headless stalk, it waited until the breeze brought another stalk within reach, which was eagerly grasped and instantly beheaded. Thus a single worm is capable of doing much damage. A field of mine which several weeks ago promised to yield 20 to 30 bushels, is injured probably to the extent of one-fourth. Our oldest farmers are unacquainted with the insect or its work.

ANSWERED BY PROF. A. J. COOK.

The specimen received was so blackened and obscured by decomposition that I am sure of only one thing—that it is a slug, or the larva of a Saw-fly. It is undoubtedly the same that is devastating the fields of Pennsylvania and New Jersey. It is a new enemy of the wheat plant. The cutting habit so well described as characterizing this larva wherever it works, is the more remarkable as it is not a characteristic generally of Saw-fly larvæ. As will be noticed, this is a relative of the currant slug, the raspberry slug, the cherry slug, and the pine slug; yet by all the above insects the foliage is eaten, and not simply cut off. Without doubt it is this same insect that is referred to in the Country Gentleman of June 24th by Prof. J. A. Lintner, as seriously injuring the wheat in New Jersey and Pennsylvania. It was spoken of in a late issue of the Philadelphia Press as doing great damage to wheat in or near Gettysburg, Pa. It seems very probable that it is an insect which has previously destroyed or fed upon some wild plant, and now has changed its habits. That it will prove transient and not a permanent pest, is to be hoped, but not expected. We find such changed habits usually come to stay.

RAISING A COLT BY HAND.

T. G. L. Essex, N. Y.—In raising a colt by hand, how long is it necessary to sweeten the milk? Will skim-milk from a Moseley & Stoddard creamer do after he is a month old? He has had a quart of new milk reduced with one-third water, to which is added a teaspoonful of sugar, six times a day, the last feed at 9 p. m. He is in perfect health and growing fast now when three weeks old. Last week he had two quarts of new and skim-milk mixed, with a little water added.

ANS.—The colt will do well fed on milk from which the cream has been taken, as all young animals will *grow* better on foods more nitrogenous than carbonaceous. The removal of the butter fats, therefore, does not make the milk unsuitable for the young colt, but fits it to make more bone, muscle and tissue and less fat. Fat is not necessarily a condition of health or perfect growth, and if there be too much of it, it is an evidence of a diseased or unnatural condition. With the skim-milk, as the colt has thus been fed, the sugar should be continued, giving less each day for a week, and at the same time teaching the colt to eat a gill of a mixture of wheat bran, oil meal and oats, three parts bran, two oats and one oil meal. As the colt grows older, increase this food, to two quarts a day, fed twice a day. The colt should be on a grass plot where it can get grass to eat, or be kept on a ground floor with plenty of bedding—leaves or straw—and be fed cut grass green. Colts are often weaned from the mothers when three months old, and left to live on grass alone, and they are considered fit to sell and are weaned when four months old. They must not be confined so as to be deprived of plenty of exercise. This promotes health and appetite. When running in fresh clover or good grass, a colt will eat considerable, and there is no food better for it aside from milk, as it is adapted to all the wants of nature; and when the young animal is old enough to eat all its system requires, there is no need of any other food to promote a good growth. After four weeks, the colt can be fed more milk at a time, and the times of feeding may be reduced to three—morning, noon and night—and between these feedings it should have the grass to pick at and the feedings of meal. It should not be exposed to rain-storms, and will do better if it has a shelter to go under at will, if it is nothing more than a rough shed.

GAS LIME.

D. M., So. Meriden, Conn.—Gas lime is not constant in composition and no satisfactory value can be placed upon an unanalyzed sample. When applied fresh, even in small quantities, it is deadly to plants. It becomes harmless by exposure to the weather. Six or eight months would serve to free it of the sulphuretted hydrogen which it takes from the gas. It will never be as valuable as pure lime. The best way to use any quantity will be to expose it to the air, under cover, for several months, stirring and working it over occasionally. It can be applied broadcast in the Fall, and left exposed until Spring.

Miscellaneous.

Subscriber, Newbury, Ont.—Kellogg's Royal salt is an excellent butter preservative. It may not do "all that is claimed for it," unless the utmost care is taken and all conditions for success are perfect; but it is far superior to the common salt used in so many of our dairies. We have used Kellogg's salt with success. A small piece of butter salted with this preparation, was placed in an ordinary cellar with a piece of cloth placed over the top of it. At the end of six weeks it was pronounced by three persons to be as sweet as ever. A part of the same churning salted with common salt and placed by the side of the other, was rancid. 2. We should prefer the wooden tubs. 3. It is impossible to say how many pounds of milk "from a herd of common cows on pasture" ought to make a pound of butter. There are cows and cows and pastures and pastures. In the reports of the tests of some famous Jerseys, it is claimed that a pound of butter has been made from six pounds of milk. With the majority of cows the limit is much nearer 30 pounds. A cow that will make a pound of butter from 20 pounds of milk is a good one.

R. C. M., North Hector, N. Y.—Such information "as a farmer's boy ought to obtain of Oregon and Washington Territory before settling there," can hardly be obtained without a personal investigation by visiting the section in which one is thinking of settling. For such general information as may give a person an idea of what part of the country it might pay him to visit, it would be well to write to the Professor of Agriculture, State Agricultural College, Corvallis, Oregon. If he cannot supply needed information, he will be able to give the name of the person best able and most likely to do so. There are certainly many excellent agricultural openings in both Oregon and Washington Territory.

G. W. W., Morrisonville, Va.—1. Who grows beans extensively in N. Y. State? 2. How near together should White Navy Beans be in the rows, when drilled between rows of corn that has been "laid by"? 3. What is the inclosed wild flower?

ANS.—1. A. B. Cleveland, Cape Vincent, N. Y. 2. This question is submitted to our readers. 3. Asclepias tuberosa. This is the Butter-fly Weed, a native of this country. If it were a foreigner it would be cultivated, as it well deserves to be. It may be found in English gardens.

F. H. V., (no address).—1. The Associated Fanciers, Philadelphia, Pa., deal in rabbits and fancy stock of all kinds. 2. The Practical Rabbit Keeper, price $1.50, may be obtained through the American News Co.

Subscriber.—Pilling's milking tubes are made of different lengths, but not of different sizes. The regular length is 1¾ inch, and there are special lengths from 2¼ to 4¼ inches.

DISCUSSION.

J. M. D., WINONA, MINN.—When the first colony settled in this region there was a family that took the "Water Cure Journal," and, like Tom Sawyer's aunt, who changed Tom's medicine every time she received a new "Journal," they tried to follow its teachings. Among other things they learned that salt was "unnecessary and even injurious to stock." Of course, they believed it. The result was that their cattle broke into a man's shanty and ate a lot of hams and shoulders, and into a house to steal a bag of salt.

"C," RUSSELLVILLE, TENN.—"C. S.," of Highland, N. C., page 418, either thinks too much of himself or keeps closely at home. He thinks the South lives from hand to mouth, and he is the only man there with a barnful of hay, etc. Over here, in the East Tennessee Mountains, we find our hands and mouths entirely independent. Our barns are full of hay and our cribs are full of corn. "C. S." must live in a mighty poor country, and his "barnful of hay" must look lonesome. He had better feed his hay to some of the poor racks of cattle he sees about him, and move over here into a good country.

C. H., BERGEN Co., N. J.—L. C., in last RURAL, admits that salt is needed in the system. Why should he say so emphatically "I am right, but of course you are all wrong?" He is like the one juryman who called his 11 fellows "obstinate." The only point "L. C." makes is that too much salt is bad. What intelligent human being thinks differently? The great difference between "L. C." and the rest of the world lies in his estimate of the size of the dose of salt that will produce injurious results. Of what value is his experiment upon himself unless he can show that he is stronger, heavier or healthier than he was before he quit using salt? He does not state this, nor does he state that he is exceptionally strong and vigorous, as he ought to be, if his ideas are correct. We do not hear that the trainers of athletes discard salt in moderate doses. Why do not our anti-salt friends attempt to prove that in instances where men or animals have performed remarkable feats of strength or endurance, no salt was eaten beyond what was contained in the food? Such evidence would be worth a dozen pages of the testimony of the "hundred persons" who will not take salt from the cellar. Practical cattle-men and feeders know well enough that stock eat and drink to better advantage when there is a constant supply of salt before them. We do not raise cattle for the purpose of seeing how little water they can drink. We want them to eat all they will and drink all they want. The object is to crowd all the food into them that they can digest. No man has yet known an animal to take too much salt when the substance was placed constantly before it.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JULY 24, 1886.

It appears, according to a note from our trustworthy correspondent, Mr. Falconer, that the much-talked-of Deacon Lettuce is simply the White Summer Cabbage Lettuce. So it goes.

A NURSERYMAN near New York writes us that it will not do to sell seedlings of the Japan Chestnut. They are not reliable. He is grafting from one he fruited three years ago because it is so large and productive. "It beats all," he says, "for bearing, grafts set the past Spring being full of blooms."

SEE if any of the plants of your best potatoes bear fruit (seed-balls). If so, mark and gather them when ripe—just before the vines begin to die. They may appear green and immature, but the seed is ripe and will grow. If these seeds be planted *now* in boxes or frames, tubers will form before severe frosts. They may then be preserved in sand until next Spring.

THE presents which were given for clubs of subscribers gave, so far as we can learn, better satisfaction this year than ever before. We mean that every one who works for the RURAL shall be well paid. Many small clubs have been sent in, so many in fact that the list of presents was exhausted before all our agents could be supplied. To them our new premium list, soon to be issued, and which we think will contain the most liberal propositions we have ever made to our agents, will be available. We prefer that they should wait for this, as we are confident it will prove far more satisfactory than last year's list. If any agent has been overlooked, or if perfect satisfaction has not been afforded, we shall be glad to know of it, that the matter may be rectified.

THE R. N.-Y. showed, as the results of careful experiments made six years ago, that a large proportion of weevil-eaten peas will not germinate. It is now time to gather seed peas for another year, and we are reminded to tell our readers that the seed may be preserved without material injury if treated in this way: Place the seeds in a pan or other vessel. Pour a few drops of bisulphide of carbon (which may be bought at any druggist's for a few cents) upon a piece of cotton or sponge, and place this in the vessel, which must then be covered. Let the seed remain in this for a day or even two, shaking the vessel two or three times meanwhile. The carbon will kill the grubs (larvæ of the weevil), which up to this time have not done material injury to the peas. We tried it last year upon a dozen lots of seed peas, and, when planted last Spring, they did not show a single weevil hole, and all germinated well.

THERE is more practical benevolence in the various "fresh air" charities which are so carefully carried out in our large cities, than in any similar scheme with which we are familiar. Poor city children are carried into the country, where, for a week or two, in some bountiful farm house they fairly revel in happiness. Who can tell of the unspeakable happiness that comes to these little city waifs at this vacation! New thoughts, new hopes and new lives come up before them. Many of them find new homes in the country, and all are made better for the visit. It is a noble charity, and should be encouraged. Those who give money for the enterprise are no more truly charitable than the patient men and the motherly women who do so much to make the little ones happy on the farm. Life for many is hard and rough. The lamps of hope burn dimly in some lives. By pouring oil from our own full stores into these lamps we lose nothing, but help ourselves.
